

ispLSI® 2032/A

In-System Programmable High Density PLD

Features

- ENHANCEMENTS

- ispLSI 2032A is Fully Form and Function Compatible to the ispLSI 2032, with Identical Timing Specifications and Packaging
- ispLSI 2032A is Built on an Advanced 0.35 Micron E²CMOS® Technology

- HIGH DENSITY PROGRAMMABLE LOGIC

- 1000 PLD Gates
- 32 I/O Pins, Two Dedicated Inputs
- 32 Registers
- High Speed Global Interconnect
- Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
- Small Logic Block Size for Random Logic

- HIGH PERFORMANCE E²CMOS® TECHNOLOGY

- $f_{max} = 180$ MHz Maximum Operating Frequency
- $t_{pd} = 5.0$ ns Propagation Delay
- TTL Compatible Inputs and Outputs
- Electrically Erasable and Reprogrammable
- Non-Volatile
- 100% Tested at Time of Manufacture
- Unused Product Term Shutdown Saves Power

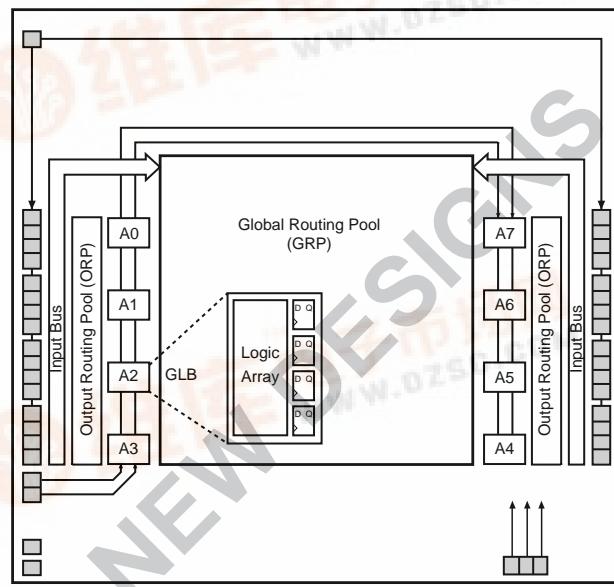

- IN-SYSTEM PROGRAMMABLE

- In-System Programmable (ISP™) 5V Only
- Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
- Reprogram Soldered Devices for Faster Prototyping

- OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS

- Complete Programmable Device Can Combine Glue Logic and Structured Designs
- Enhanced Pin Locking Capability
- Three Dedicated Clock Input Pins
- Synchronous and Asynchronous Clocks
- Programmable Output Slew Rate Control to Minimize Switching Noise
- Flexible Pin Placement
- Optimized Global Routing Pool Provides Global Interconnectivity

Functional Block Diagram

0139Bisp/2000

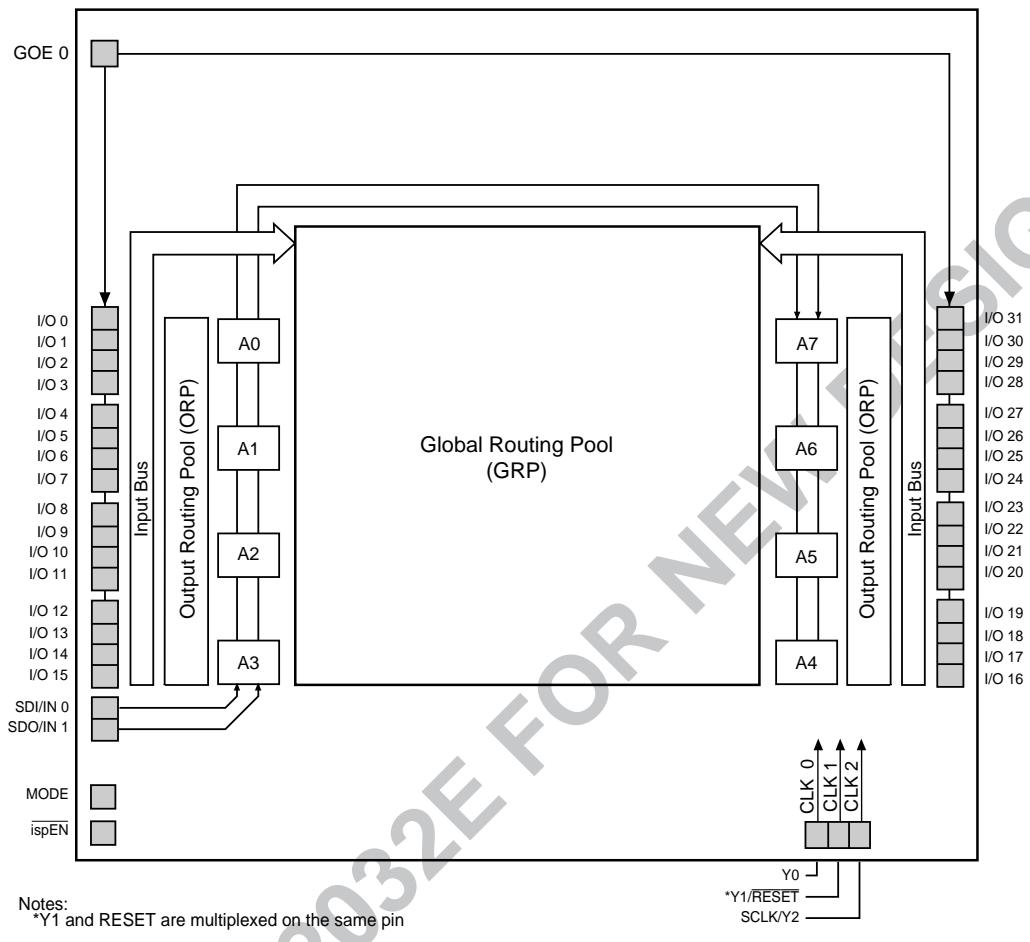

Description

The ispLSI 2032 and 2032A are High Density Programmable Logic Devices. The devices contain 32 Registers, 32 Universal I/O pins, two Dedicated Input Pins, three Dedicated Clock Input Pins, one dedicated Global OE input pin and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2032 and 2032A feature 5V in-system programmability and in-system diagnostic capabilities. The ispLSI 2032 and 2032A offer non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

The basic unit of logic on these devices is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. A7 (Figure 1). There are a total of eight GLBs in the ispLSI 2032 and 2032A devices. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

Functional Block Diagram

Figure 1. *ispLSI 2032/A* Functional Block Diagram

The devices also have 32 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

Eight GLBs, 32 I/O cells, two dedicated inputs and two ORPs are connected together to make a Megablock (Figure 1). The outputs of the eight GLBs are connected to a set of 32 universal I/O cells by the ORP. Each *ispLSI 2032* and *2032A* device contains one Megablock.

The GRP has as its inputs, the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the

GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the *ispLSI 2032* and *2032A* devices are selected using the dedicated clock pins. Three dedicated clock pins (**Y0**, **Y1**, **Y2**) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

Specifications *ispLSI 2032/A*

Absolute Maximum Ratings ¹

Supply Voltage V_{CC} -0.5 to +7.0V
Input Voltage Applied -2.5 to V_{CC} +1.0V
Off-State Output Voltage Applied -2.5 to V_{CC} +1.0V
Storage Temperature -65 to 150°C
Case Temp. with Power Applied -55 to 125°C
Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Condition

SYMBOL	PARAMETER		MIN.	MAX.	UNITS
V_{CC}	Supply Voltage	Commercial $T_A = 0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$	4.75	5.25	V
		Industrial $T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$	4.5	5.5	V
V_{IL}	Input Low Voltage		0	0.8	V
V_{IH}	Input High Voltage		2.0	$V_{CC}+1$	V

DC Electrical Characteristics

Over Recommended Operating Conditions

SYMBOL	PARAMETER	CONDITION			MIN.	TYP. ³	MAX.	UNITS
V_{OL}	Output Low Voltage	$I_{OL}= 8 \text{ mA}$			—	—	0.4	V
V_{OH}	Output High Voltage	$I_{OH}= -4 \text{ mA}$			2.4	—	—	V
I_{IL}	Input or I/O Low Leakage Current	$0V \leq V_{IN} \leq V_{IL}$ (Max.)			—	—	-10	μA
I_{IH}	Input or I/O High Leakage Current	$3.5V \leq V_{IN} \leq V_{CC}$			—	—	10	μA
I_{IL-isp}	ispEN Input Low Leakage Current	$0V \leq V_{IN} \leq V_{IL}$			—	—	-150	μA
I_{IL-PU}	I/O Active Pull-Up Current	$0V \leq V_{IN} \leq V_{IL}$			—	—	-150	μA
I_{OS} ¹	Output Short Circuit Current	$V_{CC}= 5V, V_{OUT}= 0.5V$			—	—	-200	mA
I_{CC} ^{2,4}	Operating Power Supply Current	$V_{IL}= 0.0V, V_{IH}= 3.0V$ $f_{TOGGLE}= 1 \text{ MHz}$	Comm.	-180, -150	—	60	—	mA
			Others	—	40	—	mA	
			Industrial	—	40	—	mA	

Table 2-0007/2032

- One output at a time for a maximum duration of one second. $V_{OUT}= 0.5V$ was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
- Measured using two 16-bit counters.
- Typical values are at $V_{CC}= 5V$ and $T_A= 25^\circ\text{C}$.
- Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this data sheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum I_{CC} .

 \end{aligned}$$

$$7.7 \text{ ns} = (0.6 + 0.7 + 3.8) + (0.7) + (0.7 + 1.2)$$

Note: Calculations are based upon timing specifications for the ispLSI 2032/A-180L

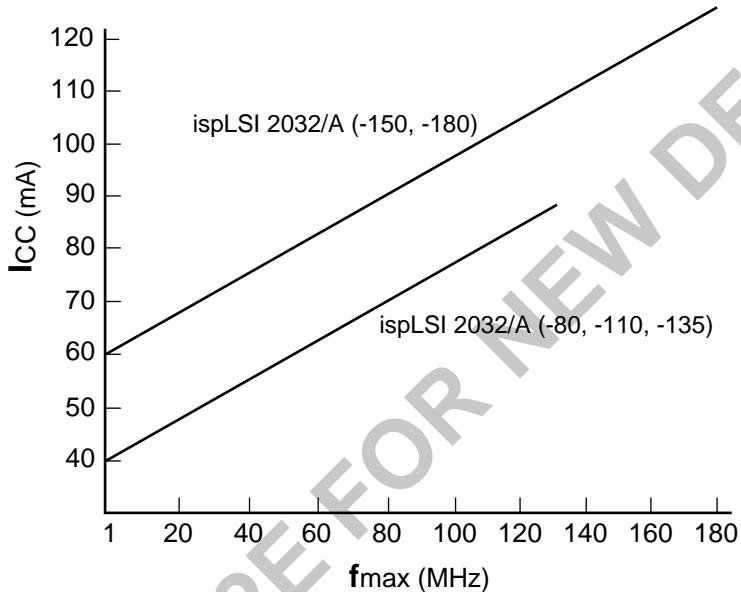

Table 2- 0042-16/2032

Power Consumption

Power consumption in the ispLSI 2032 and 2032A devices depends on two primary factors: the speed at which the device is operating and the number of Product Terms

used. Figure 4 shows the relationship between power and operating speed.

Figure 4. Typical Device Power Consumption vs fmax

Notes: Configuration of Two 16-bit Counters
Typical Current at 5V, 25° C

I_{CC} can be estimated for the ispLSI 2032/A using the following equation:

For 2032/A -150, -180: $I_{CC}(\text{mA}) = 30 + (\# \text{ of PTs} * 0.46) + (\# \text{ of nets} * \text{Max freq} * 0.012)$

For 2032/A -135, -110, -80: $I_{CC}(\text{mA}) = 21 + (\# \text{ of PTs} * 0.30) + (\# \text{ of nets} * \text{Max freq} * 0.012)$

Where:

of PTs = Number of Product Terms used in design

of nets = Number of Signals used in device

Max freq = Highest Clock Frequency to the device (in MHz)

The I_{CC} estimate is based on typical conditions ($V_{CC} = 5.0\text{V}$, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

Specifications *ispLSI 2032/A*

I/O 28 - I/O 31	7, 8, 9, 10	1, 2, 3, 4	1, 2, 3, 4	
GOE 0	2	40	43	Global Output Enable input pin.
Y0	11	5	5	Dedicated Clock input. This clock input is connected to one of the clock inputs of all the GLBs on the device.
RESET/Y1	35	29	31	This pin performs two functions: - Dedicated clock input. This clock input is brought into the Clock Distribution Network, and can optionally be routed to any GLB and/or I/O cell on the device. - Active Low (0) Reset pin which resets all of the GLB and I/O registers in the device.
ispEN	13	7	7	Input — Dedicated in-system programming enable input pin. This pin is brought low to enable the programming mode. The MODE, SDI, SDO and SCLK controls become active.
SDI/IN 0 ²	14	8	8	Input — This pin performs two functions. When <u>ispEN</u> is logic low, it functions as an input pin to load programming data into the device. SDI/IN0 also is used as one of the two control pins for the isp state machine. When <u>ispEN</u> is high, it functions as a dedicated input pin.
MODE	36	30	32	Input — When in ISP Mode, controls operation of ISP state machine.
SDO/IN 1 ²	24	18	19	Output/Input — This pin performs two functions. When <u>ispEN</u> is logic low, it functions as an output pin to read serial shift register data. When <u>ispEN</u> is high, it functions as a dedicated input pin.
SCLK/Y2 ²	33	27	29	Input — This pin performs two functions. When <u>ispEN</u> is logic low, it functions as a clock pin for the Serial Shift Register. When <u>ispEN</u> is high, it functions as a dedicated clock input. This clock input is brought into the Clock Distribution Network and can be routed to any GLB and/or I/O cell on the device.
GND	1, 23	17, 39	18, 42	Ground (GND)
VCC	12, 34	6, 28	6, 30	V _{CC}
NC ¹			12, 24, 36, 48	No Connect.

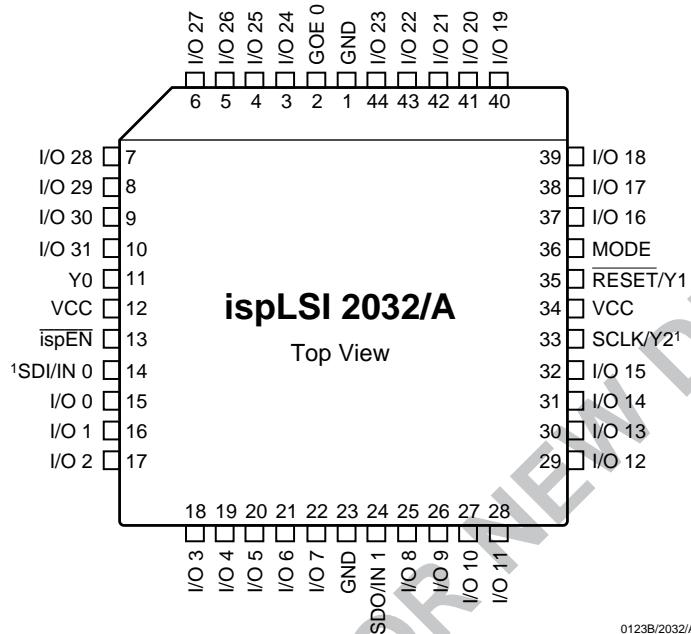

1. NC pins are not to be connected to any active signals, VCC or GND.

2. Pins have dual function capability.
