

XCM410 Series

ETR2426_001

2 Channel Voltage Detector (Sense Pin separated from V_{DD})

GENERAL DESCRIPTION

The XCM410 series is a multi combination module IC which comprises of two voltage detectors, XC6108 and XC6109 series. The two detectors inside are highly precise, low power consumption voltage detectors using laser trimming technology. The sense pin (V_{SEN}) for channel 1 (V_{OUT1}) is separated from power supply (V_{IN}) so that it allows this pin to monitor added power supply. This feature enables output to maintain the state of detection even when voltage of the monitored power supply drops to 0V. The output configuration is N-channel open-drain.

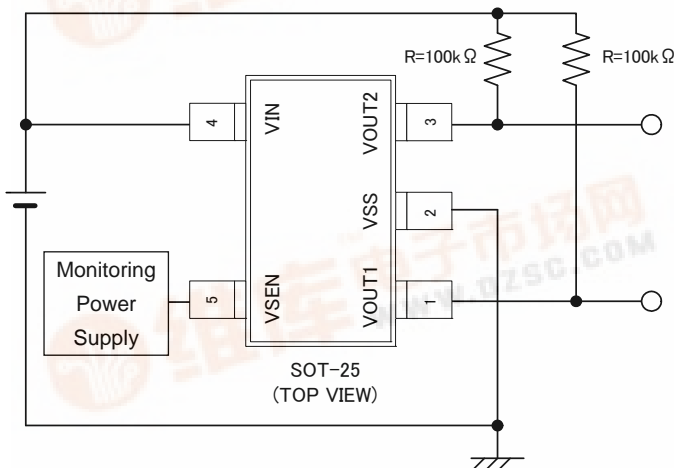

APPLICATIONS

- Microprocessor reset circuitry
- Charge voltage monitors
- Memory battery back-up switch circuits
- Power failure detection circuits

FEATURES

- High Accuracy** : $\pm 2\%$ (Detect Voltage 1.5V)
: $\pm 30\text{mV}$ (Detect Voltage $< 1.5\text{V}$)
- Low Power Consumption** : $1.7 \mu\text{A}$ (TYP)
($V_{OUT1}=1.5\text{V}$, $V_{OUT2}=3.3\text{V}$, $V_{IN}=4.0\text{V}$)
- Detect Voltage Range** : Channel1 (V_{OUT1})
0.8V ~ 5.0V (0.1V increments)
: Channel 2 (V_{OUT2})
1.1V ~ 5.0V (0.1V increments)
- Operating Voltage Range** : 1.0V ~ 6.0V
- Detect Voltage Temperature Characteristics** : $\pm 100\text{ppm/}$ (TYP.)
- Output Configuration** : N-channel open drain
- Operating Temperature Range** : -40 ~ 85
- Built-In 2 Detect Voltage Circuit**
- Separated Sense Pin** : Channel 1 (V_{OUT1})
- Small Package** : SOT-25

(*1) When $V_{DF1(T)}, V_{DF2(T)}$ 1.4V, detect accuracy is $\pm 30mV$.
When $V_{DF1(T)}, V_{DF2(T)}$ 1.5V, detect accuracy is $\pm 2\%$.

OPERATIONAL EXPLANATION

Figure1 is typical application circuit, and Fiture2 is timing chart of figure1.

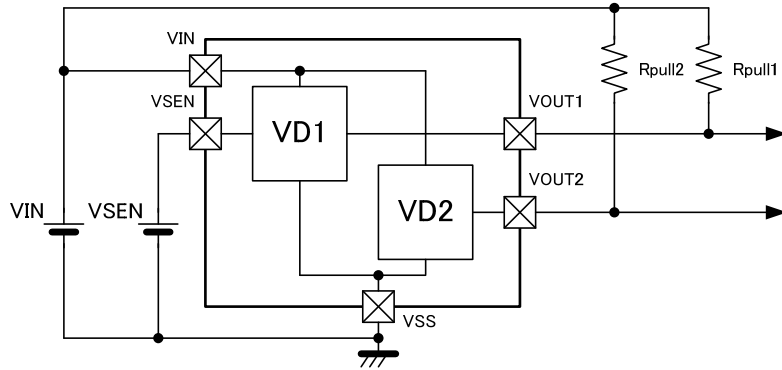

Figure 1: Typical application circuit example

Figure 2: The timing chart of Figure 1

- ① As an early state, the V_{IN} power supply pin and the V_{SEN} sense pin are applied sufficiently high voltage (6.0V MAX.). While the sense pin voltage V_{SEN} starts dropping to the detect voltage V_{DF1} ($V_{SEN} > V_{DF1}$), the output voltage V_{OUT1} keeps high level ($=V_{IN}$).

* If a pull-up resistor of the N-ch open drain is connected to added power supply different from the input voltage pin, the high level will be a voltage value where the pull-up resistor is connected.

- ② When the sense pin voltage keeps dropping and becomes equal to the detect voltage ($V_{SEN} = V_{DF1}$), the output voltage changes into the low level ($\leq V_{IN} \times 0.1$). The detect delay time t_{DF1} is defined as time which ranges from $V_{SEN} = V_{DF1}$ to the V_{OUT1} goes in low level.
- ③ The output voltage (V_{OUT1}) maintains low level while the sense pin voltage increases again to reach the release voltage ($V_{SEN} < V_{DF1} + V_{HYS1}$).
- ④ The release delay time t_{DR1} is defined as time which ranges from sense pin voltage reaches release voltage ($V_{SEN} \geq V_{DF1} + V_{HYS1}$) to the V_{OUT1} goes in high level.

OPERATIONAL EXPLANATION (Continued)

- ⑤ The output voltage V_{OUT1} maintains high level ($=V_{IN}$) while the sense pin voltage more than detect voltage ($V_{SEN} > V_{DF1}$).
- ⑥ The V_{IN} input voltage pin is applied sufficiently high voltage to the release voltage ($V_{DF2} + V_{HYS2}$). While the input pin voltage V_{IN} starts dropping to the detect voltage V_{DF2} ($V_{IN} > V_{DF2}$), the output voltage V_{OUT2} keeps high level ($=V_{IN}$).
* If a pull-up resistor of the N-ch open drain is connected to added power supply different from the input voltage pin, the high level will be a voltage value where the pull-up resistor is connected.
- ⑦ When the input pin voltage keeps dropping and becomes equal to the detect voltage ($V_{IN} = V_{DF2}$), the output voltage changes into low level ($V_{IN} \times 0.1$). The detect delay time t_{DF2} is defined as time which ranges from $V_{IN} = V_{DF}$ to the V_{OUT} goes in low level.
- ⑧ While the input pin voltage keeps below the detect voltage V_{DF2} , and 1.0V or more, the output voltage V_{OUT2} maintains low level.
- ⑨ While the input pin voltage drops to 1.0V or less and it increases again to 1.0V or more, the output voltage (V_{OUT2}) may not be able to maintain low level. Such an operation is called "Undefined Operation", and the output voltage from the V_{OUT2} pin is called undefined operating voltage V_{UNS} .
- ⑩ While the input pin voltage increases from 1.0V to the release voltage level ($V_{IN} < V_{DF2} + V_{HYS2}$), the output voltage (V_{OUT2}) maintains low level.
- ⑪ The release delay time t_{DR2} is defined as time which ranges from the V_{IN} power supply voltage pin reaches release voltage ($V_{IN} \geq V_{DF2} + V_{HYS2}$) to the V_{OUT2} goes in high level.
- ⑫ The output voltage V_{OUT2} maintains high level ($=V_{IN}$) while the power supply voltage more than detect voltage ($V_{IN} > V_{DF2}$).
- ⑬ If a pull-up resistor R_{pull1} of the N-ch open drain is connected to power supply V_{IN} , output voltage V_{OUT1} becomes same to the input voltage V_{IN} . While the V_{IN} power supply voltage drops below 1.0V and increases again to 1.0V or more, the output voltage V_{OUT2} may not be able to maintain low level.

NOTE ON USE

1. Use this IC within the stated maximum ratings. Operation beyond these limits may cause degrading or permanent damage to the device.
2. The power supply input pin voltage drops by the resistance between power supply and the VIN pin, and by through current at operation of the IC. At this time, the IC may go into malfunction if the power supply input pin voltage falls below the minimum operating voltage range.
3. When the sense voltage is less than 1.0V, be sure to separate the VIN pin and the sense pin, and to apply the voltage over 1.0V to the VIN pin.
4. Note that a rapid and high fluctuation at the power supply input pin voltage may cause a wrong operation.
5. In N channel open drain output, VOUT voltages at detect and release are determined by resistance of a pull-up resistor connected at the VOUT pin. Please choose proper resistance values with referring to Figure 3;

During detection : $V_{OUT} = V_{pull} / (1 + R_{pull} / R_{ON})$

Vpull : Pull-up voltage

$R_{ON}^{(1)}$: On-resistance of N channel driver M3 can be calculated as V_{DS} / I_{OUT1} from electrical characteristics,

For example, when $(^{2}) R_{ON} = 0.5 / 0.8 \times 10^{-3} = 625$ (MIN.) at $V_{IN} = 2.0V$, $V_{pull} = 3.0V$ and $V_{OUT} = 0.1V$ at detect,

$$R_{pull} = (V_{pull} / V_{OUT} - 1) \times R_{ON} = (3 / 0.1 - 1) \times 625 = 18 \text{ k}$$

In this case, Rpull should be selected higher or equal to 18k in order to keep the output voltage less than 0.1V during detection.

$(^{1}) V_{IN}$ is smaller R_{ON} is bigger, be noted.

$(^{2})$ For calculation, minimum V_{IN} should be chosen among the input voltage range.

During releasing : $V_{OUT} = V_{pull} / (1 + R_{pull} / R_{OFF})$

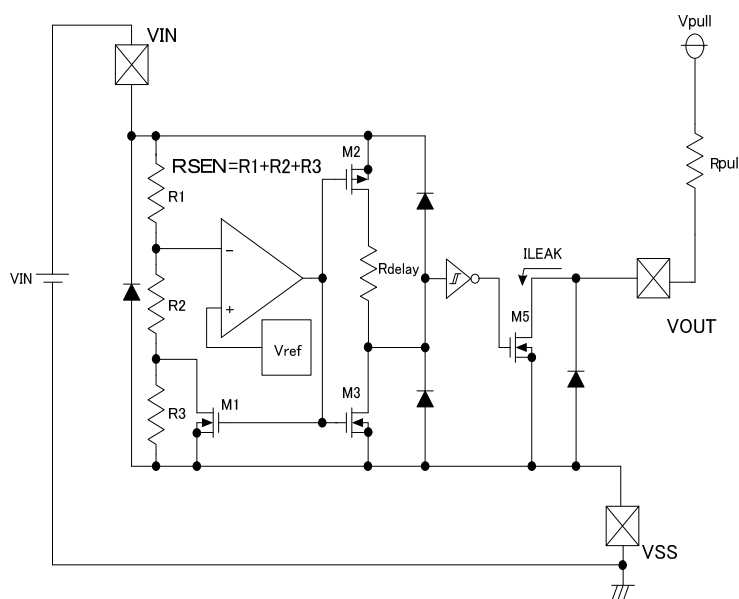

Vpull : Pull-up voltage

R_{OFF} : On-resistance of N channel driver M3 is 15M (MIN.) when the driver is off (as to V_{OUT} / I_{LEAK})

For example : when $V_{pull} = 6.0V$ and $V_{OUT} = 5.99V$,

$$R_{pull} = (V_{pull} / V_{OUT} - 1) \times R_{off} = (6 / 5.99 - 1) \times 15 \times 10^6 = 25 \text{ k}$$

In this case, Rpull should be selected smaller or equal to 25 k in order to obtain output voltage higher than 5.99V during releasing.

NOTE: $R_{off} = V_{OUT} / I_{LEAK}$
