description

The SN65LVDS1 is a single low-voltage differential line driver in the small-outline transistor package. The outputs comply with the TIA/EIA-644 standard and provide a minimum differential output voltage magnitude of 247 mV into a $100-\Omega$ load at signaling rates up to 630 Mbps.

Open	L	Н			

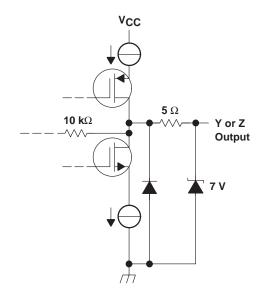

When used with an LVDS receiver (such as the SN65LVDT2) in a point-to-point connection, data or clocking signals can be transmitted over printed-circuit board traces or cables at very high rates with very low electromagnetic emissions and power consumption. The packaging, low power, low EMI, high ESD tolerance, and wide supply voltage range make this device ideal for battery-powered applications.

The SN65LVDS1 is characterized for operation from -40°C to 85°C.

[†] Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
