

# Ultra-Small, Low-Cost, 145MHz Op Amps with Rail-to-Rail Outputs and Disable

## General Description

The MAX4389/MAX4390/MAX4392–MAX4396 family of op amps are unity-gain stable devices that combine high-speed performance, Rail-to-Rail® outputs, and disable mode. These devices are targeted for applications where an input or an output is exposed to the outside world, such as video and communications.

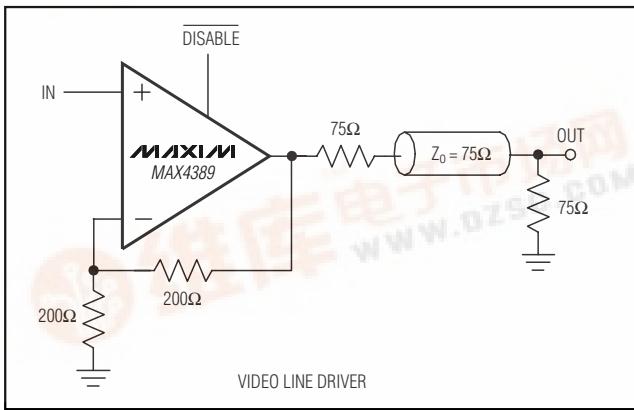

The MAX4389/MAX4390/MAX4392–MAX4396 operate from a single 4.5V to 11V supply or from dual  $\pm 2.25$ V to  $\pm 5.5$ V supplies. The common-mode input voltage range extends to the negative power-supply rail (ground in single-supply applications). The MAX4389/MAX4390/MAX4392–MAX4396 consume only 5.5mA of quiescent supply current per amplifier while achieving a 145MHz -3dB bandwidth, 35MHz 0.1dB gain flatness, and a 200V/ $\mu$ s slew rate. Disable mode sets the outputs to high impedance while consuming only 450 $\mu$ A of current.

The MAX4389 single, MAX4393 dual, MAX4394 triple, and MAX4396 quad include disable capabilities. The MAX4389 and MAX4390 are available in ultra-small, 6-pin SC70 packages.

## Applications

- Set-Top Boxes
- Surveillance Video Systems
- Analog-to-Digital Converter Interface
- CCD Imaging Systems
- Digital Cameras
- Video-on-Demand
- Video Line Driver

## Typical Operating Circuit

Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.

# MAXIM

## Features

- ♦ Low Cost
- ♦ High Speed
  - 145MHz -3dB Bandwidth
  - 35MHz 0.1dB Gain Flatness
  - 200V/ $\mu$ s Slew Rate
- ♦ Single 4.5V to 11V or Dual  $\pm 2.25$ V to  $\pm 5.5$ V Operation
- ♦ Rail-to-Rail Outputs
- ♦ Input Common-Mode Range Extends to VEE
- ♦ Low Differential Gain/Phase: 0.015%/0.015°
- ♦ Low Distortion at 5MHz
  - 59dBc Spurious-Free Dynamic Range
- ♦ High Output Drive:  $\pm 50$ mA
- ♦ 450 $\mu$ A Disable Capability (MAX4389/MAX4393/MAX4394/MAX4396)
- ♦ Space-Saving SC70, SOT23,  $\mu$ MAX, or TSSOP Packages

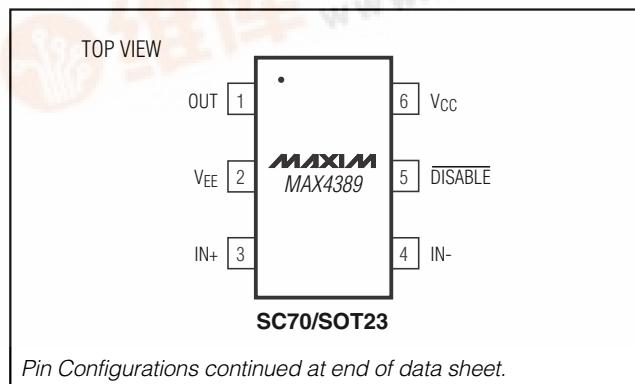

## Ordering Information

## Pin Configurations

Pin Configurations continued at end of data sheet.

# MAX4389/MAX4390/MAX4392-MAX4396

# **Ultra-Small, Low-Cost, 145MHz Op Amps with Rail-to-Rail Outputs and Disable**

## **ABSOLUTE MAXIMUM RATINGS**

Supply Voltage ( $V_{CC}$ to $V_{EE}$ )	-0.3V to +12V
$IN_+$ , $IN_-$ , $OUT_-$ , $\overline{DISABLE}$	( $V_{EE}$ - 0.3V) to ( $V_{CC}$ + 0.3V)
Differential Input Voltage	±2.5V
Current into Input Pins	±20mA
Output Short-Circuit Duration to $V_{CC}$ or $V_{EE}$ (Note 1)	Continuous
Continuous Power Dissipation ( $T_A = +70^\circ C$ )	
5-Pin SOT23 (derate 7.1mW/ $^\circ C$ above +70 $^\circ C$ )	571mW
6-Pin SOT23 (derate 8.7mW/ $^\circ C$ above +70 $^\circ C$ )	696mW
6-Pin SC70 (derate 3.1mW/ $^\circ C$ above +70 $^\circ C$ )	245mW

**Note 1:** Continuous power dissipation must also be observed.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## **Detailed Description**

The MAX4389/MAX4390/MAX4392–MAX4396 are dual-supply, rail-to-rail, voltage-feedback amplifiers that employ current-feedback techniques to achieve 200V/ $\mu$ s slew rates and 145MHz bandwidths. Excellent harmonic distortion and differential gain/phase performance make these amplifiers an ideal choice for a wide variety of video and RF signal-processing applications.

## **Applications Information**

The output voltage swings to within 200mV of each supply rail. Local feedback around the output stage ensures low open-loop output impedance to reduce

gain sensitivity to load variations. The input stage permits common-mode voltages to the negative supply and to within 2.25V of the positive supply rail.

## **Choosing Resistor Values**

### **Unity-Gain Configuration**

The MAX4389/MAX4390/MAX4392–MAX4396 are internally compensated for unity gain. When configured for unity gain, a 24 $\Omega$  resistor ( $R_F$ ) in series with the feedback path optimizes AC performance. This resistor improves AC response by reducing the Q of the parallel LC circuit formed by the parasitic feedback capacitance and inductance.

**MAX4389/MAX4390/MAX4392–MAX4396**

## Ultra-Small, Low-Cost, 145MHz Op Amps with Rail-to-Rail Outputs and Disable

### Video Line Driver

The MAX4389/MAX4390/MAX4392-MAX4396 are low-power, voltage-feedback amplifiers featuring bandwidths up to 100MHz, 0.1dB gain flatness to 15MHz. They are designed to minimize differential-gain error and differential-phase error to 0.015% and 0.015°, respectively. They have a 12ns settling time to 0.1%, 200V/μs slew rates, and output-current-drive capability of up to 50mA making them ideal for driving video loads.

### Inverting and Noninverting Configurations

Select the gain-setting feedback ( $R_F$ ) and input ( $R_G$ ) resistor values to fit your application. Large resistor values increase voltage noise and interact with the amplifier's input and PC board capacitance. This can generate undesirable poles and zeros and decrease bandwidth or cause oscillations. For example, a noninverting gain-of-two configuration ( $R_F = R_G$ ) using 2kΩ resistors, combined with 1pF of amplifier input capacitance and 1pF of PC board capacitance, causes a pole at 79.6MHz. Since this pole is within the amplifier bandwidth, it jeopardizes stability. Reducing the 2kΩ resistors to 100Ω extends the pole frequency to 1.59GHz, but could limit output swing by adding 200Ω in parallel with the amplifier's load resistor (Figures 1a and 1b).

### Layout and Power-Supply Bypassing

The MAX4389/MAX4390/MAX4392-MAX4396 operate from single 4.5V to 11V or from dual ±2.25V to ±5.5V supplies. Bypass each supply with a 0.1μF capacitor as close to the pin as possible.

Maxim recommends using microstrip and stripline techniques to obtain full bandwidth. To ensure that the PC board does not degrade the amplifier's performance, design it for a frequency greater than 1GHz. Pay careful attention to inputs and outputs to avoid large parasitic capacitance. Whether or not you use a constant-impedance board, observe the following design guidelines:

- Do not use wire-wrap boards; they are too inductive.
- Do not use IC sockets; they increase parasitic capacitance and inductance.
- Use surface-mount instead of through-hole components for better, high-frequency performance.
- Use a PC board with at least two layers; it should be as free from voids as possible.
- Keep signal lines as short and as straight as possible. Do not make 90° turns; round all corners.

### Low-Power Disable Mode

The MAX4389/MAX4393/MAX4394/MAX4396 feature a disable function that allows the amplifiers to be placed in a low-power, high-output-impedance state. When the disable pin (DISABLE) is active, the amplifier's output impedance is 95kΩ. This high resistance and the low 2pF output capacitance make the MAX4389/MAX4390/MAX4392-MAX4396 in RF/video multiplexer or switch applications. For larger arrays, pay careful attention to capacitive loading (see the *Output Capacitive Loading and Stability* section).

### Output Capacitive Loading and Stability

The MAX4389/MAX4390/MAX4392-MAX4396 are optimized for AC performance. They are not designed to drive highly reactive loads, which decrease phase margin and may produce excessive ringing and oscillation. Figure 2 shows a circuit that eliminates this problem. Figure 3 is a graph of the Optimal Isolation Resistor ( $R_s$ ) vs. Capacitive Load. Figure 4 shows how a capacitive load causes excessive peaking of the amplifier's frequency response if the capacitor is not isolated from the amplifier by a resistor. A small isolation resistor (usually 10Ω to 15Ω) placed before the reactive load prevents ringing and oscillation. At higher capacitive loads, AC performance is controlled by the interaction of the load capacitance and the isolation resistor. Figure 5 shows the effect of a 15Ω isolation resistor on closed-loop response.
