- Low Supply Voltage Range 1.8 V – 3.6 V
- Ultralow-Power Consumption:
  - Active Mode: 200 µA at 1 MHz, 2.2 V
  - Standby Mode: 0.7 µA
  - Off Mode (RAM Retention): 0.1 µA
- Five Power Saving Modes
- Wake-Up From Standby Mode in 6 µs
- 16-Bit RISC Architecture, 125 ns Instruction Cycle Time
- Basic Clock Module Configurations:
  - Various Internal Resistors
  - Single External Resistor
  - 32-kHz Crystal
  - High Frequency Crystal
  - Resonator
  - External Clock Source
- 16-Bit Timer_A With Three Capture/Compare Registers
- 10-Bit, 200-ksps A/D Converter With Internal Reference, Sample-and-Hold, Autoscan, and Data Transfer Controller
- Serial Communication Interface (USART) With Software-Selectable Asynchronous UART or Synchronous SPI (MSP430x12x2 Only)
- Serial Onboard Programming, No External Programming Voltage Needed Programmable Code Protection by Security Fuse
- Supply Voltage Brownout Protection
- MSP430x11x2 Family Members Include:
  MSP430F1122: 4KB + 256B Flash Memory 256B RAM
  MSP430F1132: 8KB + 256B Flash Memory 256B RAM
  Available in 20-Pin Plastic SOWB and 20-Pin Plastic TSSOP Packages
- MSP430x12x2 Family Members Include:
  MSP430F1222: 4KB + 256B Flash Memory 256B RAM
  MSP430F1232: 8KB + 256B Flash Memory 256B RAM
  Available in 28-Pin Plastic SOWB and 28-Pin Plastic TSSOP Packages
- For Complete Module Descriptions, See the MSP430x1xx Family User's Guide, Literature Number SLAU049

description

The Texas Instruments MSP430 family of ultralow-power microcontrollers consist of several devices featuring different sets of peripherals targeted for various applications. The architecture, combined with five low power modes is optimized to achieve extended battery life in portable measurement applications. The device features a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that attribute to maximum code efficiency. The digitally controlled oscillator (DCO) allows wake-up from low-power modes to active mode in less than 6µs.

The MSP430x11x2 and MSP430x12x2 series are ultralow-power mixed signal microcontrollers with a built-in 16-bit timer, 10-bit A/D converter with integrated reference and data transfer controller (DTC) and fourteen or twenty-two I/O pins. In addition, the MSP430x12x2 series microcontrollers have built-in communication capability using asynchronous (UART) and synchronous (SPI) protocols.

Digital signal processing with the 16-bit RISC performance enables effective system solutions such as glass breakage detection with signal analysis (including wave digital filter algorithm). Another area of application is in stand-alone RF sensors.

XOUT	5	5	I/O	Output terminal of crystal oscillator

† TDO or TDI is selected via JTAG instruction.

short-form description

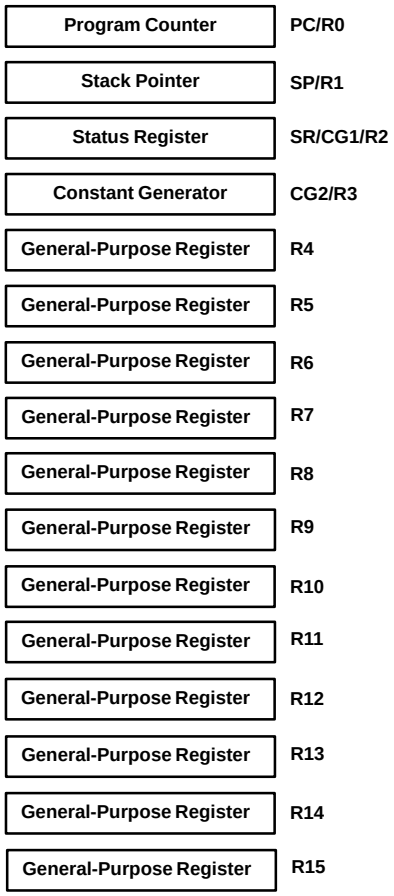
CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses, and can be handled with all instructions.



instruction set

The instruction set consists of 51 instructions with three formats and seven address modes. Each instruction can operate on word and byte data. Table 1 shows examples of the three types of instruction formats; the address modes are listed in Table 2.

Table 1. Instruction Word Formats

Dual operands, source-destination	e.g. ADD R4,R5	R4 + R5 ——> R5
Single operands, destination only	e.g. CALL R8	PC —>(TOS), R8—> PC
Relative jump, un/conditional	e.g. JNE	Jump-on-equal bit = 0

Table 2. Address Mode Descriptions

ADDRESS MODE	S	D	SYNTAX	EXAMPLE	OPERATION
Register	✓	✓	MOV Rs,Rd	MOV R10,R11	R10 —> R11
Indexed	✓	✓	MOV X(Rn),Y(Rm)	MOV 2(R5),6(R6)	M(2+R5)—> M(6+R6)
Symbolic (PC relative)	✓	✓	MOV EDE,TONI		M(EDE) —> M(TONI)
Absolute	✓	✓	MOV and MEM,and TCDAT		M(MEM) —> M(TCDAT)
Indirect	✓		MOV @Rn,Y(Rm)	MOV @R10,Tab(R6)	M(R10) —> M(Tab+R6)
Indirect autoincrement	✓		MOV @Rn+,Rm	MOV @R10+,R11	M(R10) —> R11 R10 + 2—> R10
Immediate	✓		MOV #X,TONI	MOV #45,TONI	#45 —> M(TONI)

NOTE: S = source D = destination

operating modes

The MSP430 has one active mode and five software selectable low-power modes of operation. An interrupt event can wake up the device from any of the five low-power modes, service the request and restore back to the low-power mode on return from the interrupt program.

The following six operating modes can be configured by software:

- Active mode AM;
  - All clocks are active
- Low-power mode 0 (LPM0);
  - CPU is disabled
    ACLK and SMCLK remain active. MCLK is disabled
- Low-power mode 1 (LPM1);
  - CPU is disabled
    ACLK and SMCLK remain active. MCLK is disabled
    DCO's dc-generator is disabled if DCO not used in active mode
- Low-power mode 2 (LPM2);
  - CPU is disabled
    MCLK and SMCLK are disabled
    DCO's dc-generator remains enabled
    ACLK remains active
- Low-power mode 3 (LPM3);
  - CPU is disabled
    MCLK and SMCLK are disabled
    DCO's dc-generator is disabled
    ACLK remains active
- Low-power mode 4 (LPM4);
  - CPU is disabled
    ACLK is disabled
    MCLK and SMCLK are disabled
    DCO's dc-generator is disabled
    Crystal oscillator is stopped

interrupt vector addresses

The interrupt vectors and the power-up starting address are located in the memory with an address range of 0FFFFh-0FFE0h. The vector contains the 16-bit address of the appropriate interrupt handler instruction sequence.

INTERRUPT SOURCE	INTERRUPT FLAG	SYSTEM INTERRUPT	WORD ADDRESS	PRIORITY
Power-up, external reset, watchdog	WDTIFG (see Note1) KEYV (see Note 1)	Reset	0FFFEh	15, highest
NMI, oscillator fault, flash memory access violation	NMIIFG (see Notes 1 and 4) OFIFG (see Notes 1 and 4) ACCVIFG (see Notes 1 and 4)	(Non)-maskable, (Non)-maskable, (Non)-maskable	0FFFCh	14
			0FFFAh	13
			0FFF8h	12
			0FFF6h	11
Watchdog timer	WDTIFG	Maskable	0FFF4h	10
Timer_A	TACCR0 CCIFG (see Note 2)	Maskable	0FFF2h	9
Timer_A	TACCR1 and TACCR2 CCIFGs, TAIFG (see Notes 1 and 2)	Maskable	0FFF0h	8
USART0 receive (see Note 5)	URXIFG0	Maskable	0FFEEh	7
USART0 transmit (see Note 5)	UTXIFG0	Maskable	0FFECh	6
ADC10	ADC10IFG	Maskable	0FFEAh	5
			0FFE8h	4
I/O Port P2 (eight flags – see Note 3)	P2IFG.0 to P2IFG.7 (see Notes 1 and 2)	Maskable	0FFE6h	3
I/O Port P1 (eight flags)	P1IFG.0 to P1IFG.7 (see Notes 1 and 2)	Maskable	0FFE4h	2
			0FFE2h	1
			0FFE0h	0, lowest

NOTES: 1. Multiple source flags
2. Interrupt flags are located in the module
3. There are eight Port P2 interrupt flags, but only six Port P2 I/O pins (P2.0–5) are implemented on the ’11x2 and ’12x2 devices.
4. (Non)-maskable: the individual interrupt enable bit can disable an interrupt event, but the general interrupt enable cannot.
5. USART0 is implemented in MSP430x12x2 only.

special function registers

Most interrupt and module enable bits are collected into the lowest address space. Special function register bits that are not allocated to a functional purpose are not physically present in the device. Simple software access is provided with this arrangement.

interrupt enable 1 and 2

Address	7	6	5	4	3	2	1	0
0h			ACCVIE	NMIIE			OFIE	WDTIE
			rw-0	rw-0			rw-0	rw-0

WDTIE: Watchdog Timer interrupt enable. Inactive if watchdog mode is selected. Active if Watchdog Timer is configured in interval timer mode.
OFIE: Oscillator fault enable
NMIIE: (Non)maskable interrupt enable
ACCVIE: Flash access violation interrupt enable

Address	7	6	5	4	3	2	1	0
01h							UTXIE0	URXIE0
							rw-0	rw-0

URXIE0: USART0, UART, and SPI receive-interrupt enable (MSP430x12x2 devices only)
UTXIE0: USART0, UART, and SPI transmit-interrupt enable (MSP430x12x2 devices only)

interrupt flag register 1 and 2

Address	7	6	5	4	3	2	1	0
02h				NMIIFG			OFIFG	WDTIFG
				rw-0			rw-1	rw-0

WDTIFG: Set on Watchdog Timer overflow (in watchdog mode) or security key violation. Reset on V_{CC} power-up or a reset condition at $\overline{RST}$/NMI pin in reset mode.
OFIFG: Flag set on oscillator fault
NMIIFG: Set via $\overline{RST}$/NMI-pin

Address	7	6	5	4	3	2	1	0
03h							UTXIFG0	URXIFG0
							rw-1	rw-0

URXIFG0: USART0, UART, and SPI receive flag (MSP430x12x2 devices only)
UTXIFG0: USART0, UART, and SPI transmit flag (MSP430x12x2 devices only)

module enable registers 1 and 2

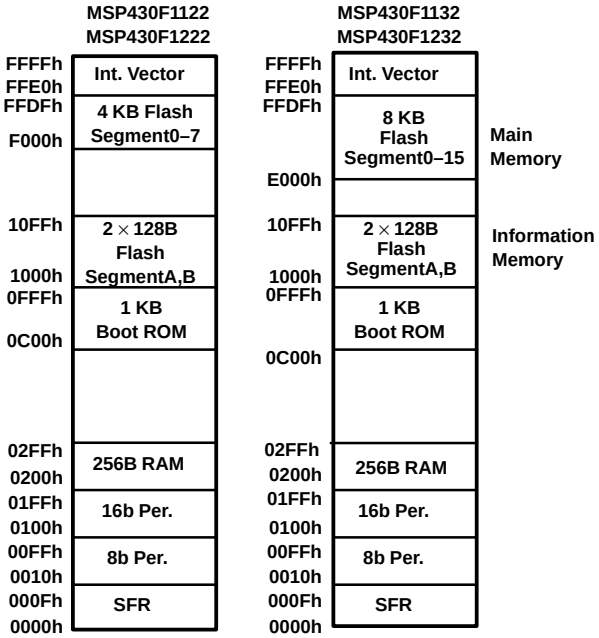
Address	7	6	5	4	3	2	1	0
04h								

Address	7	6	5	4	3	2	1	0
05h							UTXE0	URXE0 USPIE0
							rw-0	rw-0

URXE0: USART0, UART mode receive enable (MSP430x12x2 devices only)
UTXE0: USART0, UART mode transmit enable (MSP430x12x2 devices only)
USPIE0: USART0, SPI mode transmit and receive enable (MSP430x12x2 devices only)

Legend **rw:** Bit can be read and written.
rw-0: Bit can be read and written. It is reset by PUC
SFR bit is not present in device.

memory organization



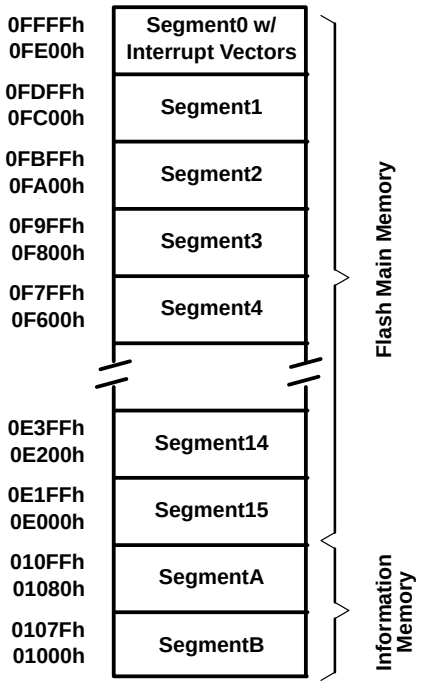
bootstrap loader (BSL)

The MSP430 bootstrap loader (BSL) enables users to program the flash memory or RAM using a UART serial interface. Access to the MSP430 memory via the BSL is protected by user-defined password. For complete description of the features of the BSL and its implementation, see the Application report *Features of the MSP430 Bootstrap Loader*, Literature Number SLAA089.

flash memory

The flash memory can be programmed via the JTAG port, the bootstrap loader, or in-system by the CPU. The CPU can perform single-byte and single-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and two segments of information memory (A and B) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A and B can be erased individually, or as a group with segments 0–n.
  Segments A and B are also called *information memory.*
- New devices may have some bytes programmed in the information memory (needed for test during manufacturing). The user should perform an erase of the information memory prior to the first use.



NOTE: All segments not implemented on all devices.

peripherals

Peripherals are connected to the CPU through data, address, and control busses and can be handled using all instructions.

oscillator and system clock

The clock system in the MSP430x11x2 and MSP430x12x2 devices is supported by the basic clock module that includes support for a 32768-Hz watch crystal oscillator, an internal digitally-controlled oscillator (DCO) and a high frequency crystal oscillator. The basic clock module is designed to meet the requirements of both low system cost and low-power consumption. The internal DCO provides a fast turn-on clock source and stabilizes in less than 6 μs. The basic clock module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32768-Hz watch crystal or a high frequency crystal.
- Main clock (MCLK), the system clock used by the CPU.
- Sub-Main clock (SMCLK), the sub-system clock used by the peripheral modules.

digital I/O

There are 3 8-bit I/O ports implemented—ports P1, P2, and P3 (only six port P2 I/O signals are available on external pins; port P3 is implemented only on ’x12x2 devices):

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Edge-selectable interrupt input capability for all the eight bits of ports P1 and six bits of port P2.
- Read/write access to port-control registers is supported by all instructions.

NOTE:

Six bits of port P2, P2.0 to P2.5, are available on external pins, but all control and data bits for port P2 are implemented. Port P3 has no interrupt capability. Port P3 is implemented in MSP430x12x2 only.

brownout

The brownout circuit is implemented to provide the proper internal reset signal to the device during power on and power off.

watchdog timer

The primary function of the watchdog timer (WDT) module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals.

USART0 (MSP430x12x2 Only)

The MSP430x12x2 devices have one hardware universal synchronous/asynchronous receive transmit (USART0) peripheral module that is used for serial data communication. The USART supports synchronous SPI (3 or 4 pin) and asynchronous UART communication protocols, using double-buffered transmit and receive channels.

timer_A3

Timer_A3 is a 16-bit timer/counter with three capture/compare registers. Timer_A3 can support multiple capture/compares, PWM outputs, and interval timing. Timer_A3 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

ADC10

The ADC10 module supports fast, 10-bit analog-to-digital conversions. The module implements a 10-bit SAR core, sample select control, reference generator and data transfer controller, or DTC, for automatic conversion result handling allowing ADC samples to be converted and stored without any CPU intervention.

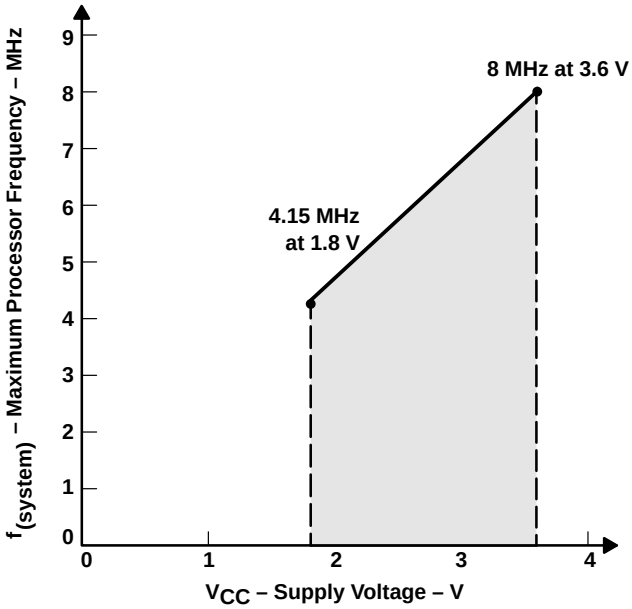
NOTES: 1. The LFXT1 oscillator in LF-mode requires a resistor of 5.1 MΩ from XOUT to V_{SS} when V_{CC} <2.5 V.
The LFXT1 oscillator in XT1-mode accepts a ceramic resonator or a crystal frequency of 4 MHz at $V_{CC} \geq$ 2.2 V.
The LFXT1 oscillator in XT1-mode accepts a ceramic resonator or a crystal frequency of 8 MHz at $V_{CC} \geq$ 2.8 V.
2. The LFXT1 oscillator in LF-mode requires a watch crystal.
The LFXT1 oscillator in XT1-mode accepts a ceramic resonator or a crystal.
3. The cumulative program time must not be exceeded during a block-write operation.

MSP430F11x2 and MSP430F12x2 Devices



NOTE: Minimum processor frequency is defined by system clock. Flash program or erase operations require a minimum V_{CC} of 2.7 V.

outputs – Ports P1, P2, and P3 (see Note 11)

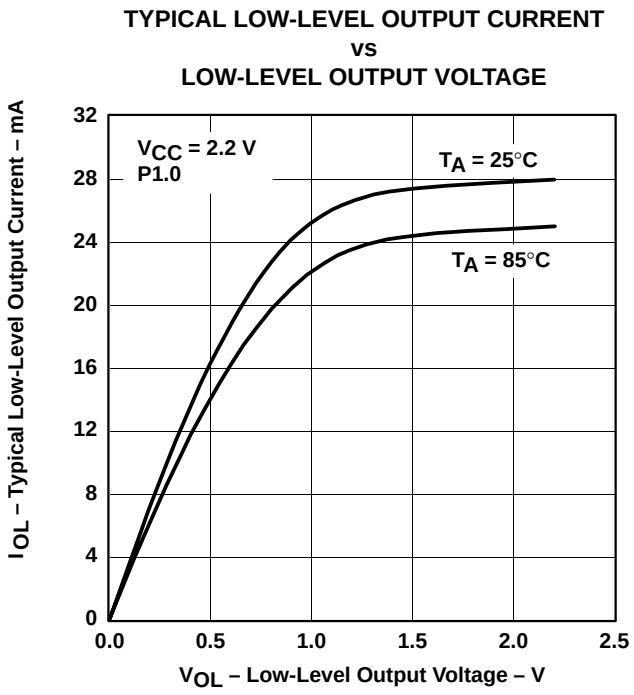

Figure 2

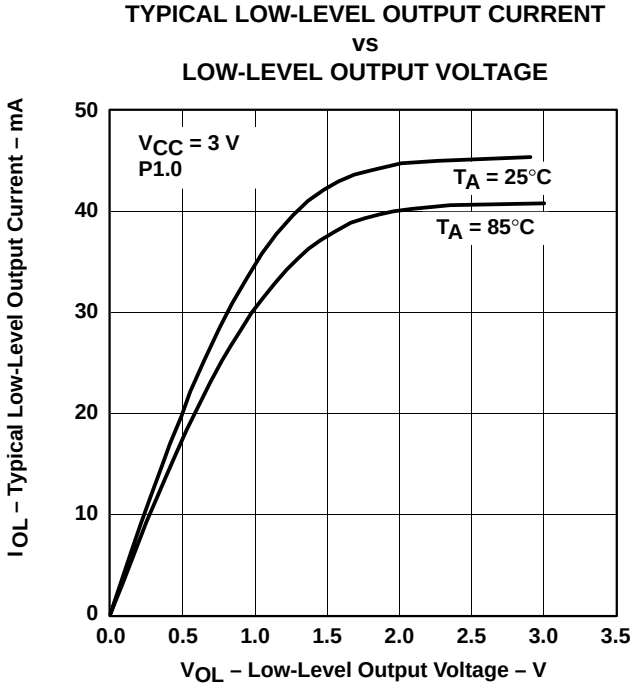

Figure 3

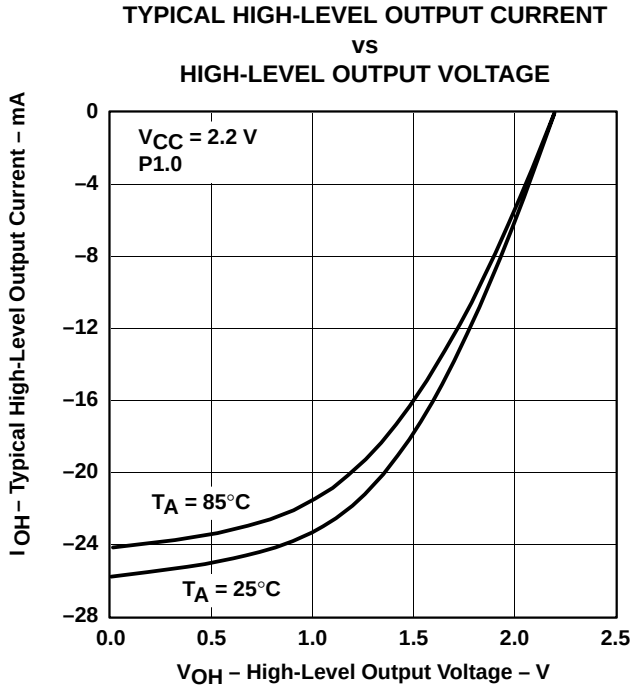

Figure 4

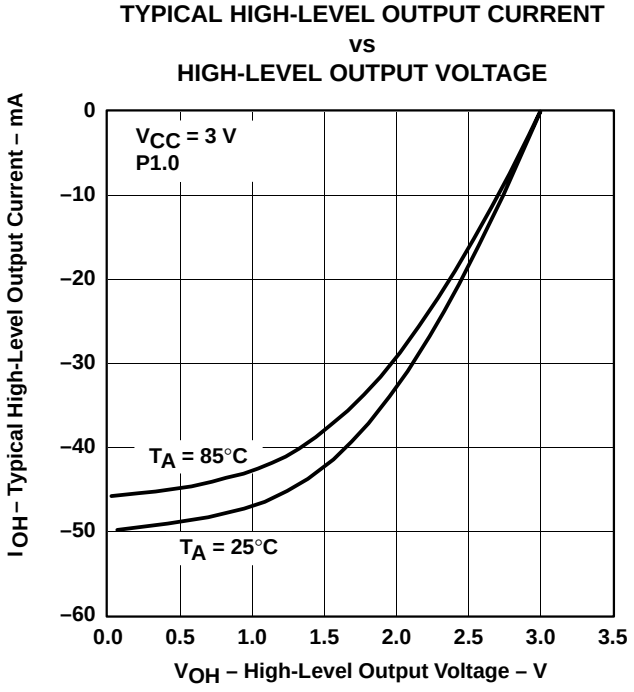

Figure 5

NOTE 3: Only one output is loaded at a time.

electrical characteristics over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (continued)

leakage current

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
$I_{lkg(Px.x)}$	High-impedance leakage current	Port P1: P1.x, $0 \le x \le 7$ (see Notes 1 and 2)	2.2 V/3 V			±50	nA
		Port P2: P2.x, $0 \le x \le 5$ (see Notes 1 and 2)	2.2 V/3 V			±50	

NOTES: 1. The leakage current is measured with V_{SS} or V_{CC} applied to the corresponding pin(s), unless otherwise noted.
2. The leakage of the digital port pins is measured individually. The port pin must be selected for input and there must be no optional pullup or pulldown resistor.

inputs Px.x, TAx

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	TYP	MAX	UNIT
$t_{(int)}$	External interrupt timing	Port P1, P2: P1.x to P2.x, External trigger signal for the interrupt flag, (see Note 1)	2.2 V/3 V	1.5			cycle
			2.2 V	62			ns
			3 V	50			
$t_{(cap)}$	Timer_A, capture timing	TA0, TA1, TA2 (see Note 2)	2.2 V/3 V	1.5			cycle
			2.2 V	62			ns
			3 V	50			
$f_{(TAext)}$	Timer_A clock frequency externally applied to pin	TACLK, INCLK $t_{(H)} = t_{(L)}$	2.2 V			8	MHz
			3 V			10	
$f_{(TAint)}$	Timer_A clock frequency	SMCLK or ACLK signal selected	2.2 V			8	MHz
			3 V			10	

NOTES: 1. The external signal sets the interrupt flag every time the minimum $t_{(int)}$ cycle and time parameters are met. It may be set even with trigger signals shorter than $t_{(int)}$. Both the cycle and timing specifications must be met to ensure the flag is set. $t_{(int)}$ is measured in MCLK cycles.
2. The external capture signal triggers the capture event every time the mimimum $t_{(cap)}$ cycle and time parameters are met. A capture may be triggered with capture signals even shorter than $t_{(cap)}$. Both the cycle and timing specifications must be met to ensure a correct capture of the 16-bit timer value and to ensure the flag is set.

USART (see Note 1)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{(\tau)}$	USART: deglitch time	V_{CC} = 2.2 V	200	430	800	ns
		V_{CC} = 3 V	150	280	500	

NOTE 1: The signal applied to the USART receive signal/terminal (URXD) should meet the timing requirements of $t_{(\tau)}$ to ensure that the URXS flip-flop is set. The URXS flip-flop is set with negative pulses meeting the minimum-timing condition of $t_{(\tau)}$. The operating conditions to set the flag must be met independently from this timing constraint. The deglitch circuitry is active only on negative transitions on the URXD line.

electrical characteristics over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (continued)

outputs P1.x, P2.x, P3.x, TAx

PARAMETER		TEST CONDITIONS		V_{CC}	MIN	TYP	MAX	UNIT
$f_{(P20)}$	Output frequency	P2.0/ACLK, C_L = 20 pF		2.2 V/3 V			f_{System}	MHz
$f_{(TAx)}$		TA0, TA1, TA2, C_L = 20 pF, Internal clock source, SMCLK signal applied (see Note 1)		2.2 V/3 V	dc		f_{System}	
$t_{(Xdc)}$	Duty cycle of O/P frequency	P1.4/SMCLK, C_L = 20 pF	$f_{SMCLK} = f_{LFXT1} = f_{XT1}$	2.2 V/3 V	40%		60%	
			$f_{SMCLK} = f_{LFXT1} = f_{LF}$		35%		65%	
			$f_{SMCLK} = f_{LFXT1/n}$		50%–15 ns	50%	50%+15 ns	
			$f_{SMCLK} = f_{DCOCLK}$	2.2 V/3 V	50%–15 ns	50%	50%+15 ns	
		P2.0/ACLK, C_L = 20 pF	$f_{P20} = f_{LFXT1} = f_{XT1}$	2.2 V/3 V	40%		60%	
			$f_{P20} = f_{LFXT1} = f_{LF}$		30%		70%	
			$f_{P20} = f_{LFXT1/n}$			50%		
$t_{(TAdc)}$		TA0, TA1, TA2, C_L = 20 pF, Duty cycle = 50%		2.2 V/3 V		0	±50	ns

NOTE 1: The limits of the system clock MCLK has to be met. MCLK and SMCLK can have different frequencies.

RAM

PARAMETER		MIN	NOM	MAX	UNIT
$V_{(RAMh)}$	CPU halted (see Note 1)	1.6			V

NOTE 1: This parameter defines the minimum supply voltage V_{CC} when the data in the program memory RAM remains unchanged. No program execution should happen during this supply voltage condition.

POR brownout, reset (see Notes 1 and 2)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{d(BOR)}$	Brownout				2000	µs
$V_{CC(start)}$		$dV_{CC}/dt \le 3$ V/s		$0.7 \times V_{(B\_IT-)}$		V
$V_{(B\_IT-)}$		$dV_{CC}/dt \le 3$ V/s			1.71	V
$V_{hys(B\_IT-)}$		$dV_{CC}/dt \le 3$ V/s	70	130	180	mV
$t_{(reset)}$		Pulse length needed at RST/NMI pin to accepted reset internally, V_{CC} = 2.2 V/3 V	2			µs

NOTES: 1. The current consumption of the brown-out module is already included in the I_{CC} current consumption data.
2. During power up, the CPU begins code execution following a period of $t_{d(BOR)}$ after $V_{CC} = V_{(B\_IT-)} + V_{hys(B\_IT-)}$. The default DCO settings must not be changed until $V_{CC} \ge V_{CC(min)}$. See the *MSP430x1xx Family User's Guide* for more information on the brownout circuit.

		3 V	–0.33	–0.38	–0.43	
D_V	Drift with V_{CC} variation, R_{sel} = 4, DCO = 3, MOD = 0 (see Note 1)	2.2 V/3 V			±5	%/V

NOTES: 1. These parameters are not production tested.

electrical characteristics over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (continued)

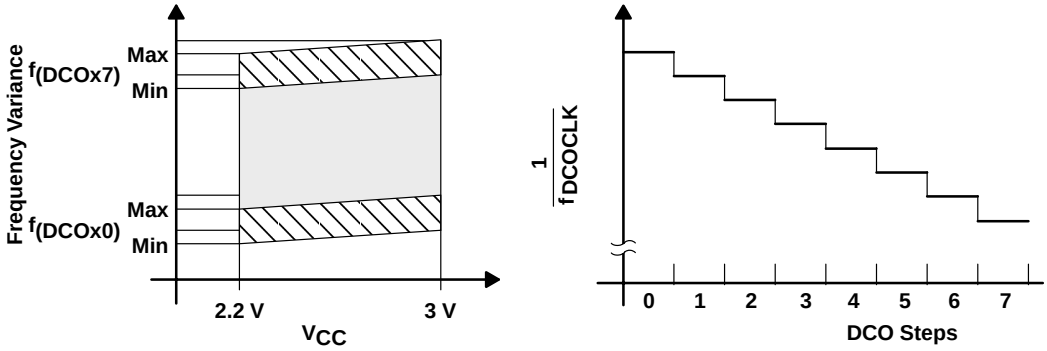

Figure 9. DCO Characteristics

principle characteristics of the DCO

- Individual devices have a minimum and maximum operation frequency. The specified parameters for f_{DCOx0} to f_{DCOx7} are valid for all devices.
- The DCO control bits DCO0, DCO1 and DCO2 have a step size as defined in parameter S_{DCO}.
- The modulation control bits MOD0 to MOD4 select how often f_{DCO+1} is used within the period of 32 DCOCLK cycles. f_{DCO} is used for the remaining cycles. The frequency is an average = $f_{DCO} \times (2^{MOD/32})$.
- All ranges selected by $R_{sel(n)}$ overlap with $R_{sel(n+1)}$: R_{sel0} overlaps with R_{sel1}, ... R_{sel6} overlaps with R_{sel7}.

wake-up from lower power modes (LPMx)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{(LPM0)}$	Delay time (see Note 1)	V_{CC} = 2.2 V/3 V		100		ns
$t_{(LPM2)}$		V_{CC} = 2.2 V/3 V		100		ns

			ADC10SR = 1		0.46	0.55	

† Not production tested, limits characterized
‡ Not production tested, limits verified by design

NOTES:
1. The leakage current is defined in the leakage current table with Px.x/Ax parameter.
2. The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
3. The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
4. The accuracy limits minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.
5. The analog input voltage range must be within the selected reference voltage range V_{R+} to V_{R-} for valid conversion results.
6. The internal reference supply current is not included in current consumption parameter I_{ADC10}.
7. The internal reference current is supplied via terminal V_{CC}. Consumption is independent of the ADC10ON control bit, unless a conversion is active. The REFON bit enables to settle the built-in reference before starting an A/D conversion.

electrical characteristics over recommended operating free-air temperature (unless otherwise noted) (continued)

10-bit ADC, reference parameters

PARAMETER		TEST CONDITIONS		MIN	NOM	MAX	UNIT
I_{VeREF+}	Static input current (see Note 1)	$0\ V \le V_{eREF+} \le V_{CC}$	2.2 V/3 V			±1	µA
$I_{VREF-/VeREF-}$	Static input current (see Note 1)	$0\ V \le V_{eREF-} \le V_{CC}$	2.2 V/3 V			±1	µA

Z_i‡	Input MUX ON resistance(see Note 3)	$0\ V \le V_{Ax} \le V_{CC}$	3 V			2000	Ω
T_{REF+}†	Temperature coefficient of built-in reference	I_{VREF+} is a constant in the range of $0\ mA \le I_{VREF+} \le 1\ mA$	2.2 V/3 V			±100	ppm/°C

† Not production tested, limits characterized

‡ Not production tested, limits verified by design

NOTES: 1. The external reference is used during conversion to charge and discharge the capacitance array. The dynamic impedance should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy.

2. The capacitance applied to the internal buffer operational amplifier, if switched to terminal P2.4/TA2/A4/V_{REF+} (REFOUT=1), must be limited; the reference buffer may become unstable otherwise.

3. The input capacitance is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy. All INL and DNL tests use capacitors between pins V_{CC} and V_{SS}: 10-µF tantalum and 100-nF ceramic.

10-bit ADC, temperature sensor and built-in Vmid

PARAMETER		TEST CONDITIONS		MIN	NOM	MAX	UNIT
I_{SENSOR}	Operating supply current into V_{CC} terminal (see Note 1)	V_{REFON} = 0, INCH = 0Ah, ADC10ON=NA, T_A = 25°C	2.2 V		40	120	µA
			3 V		60	160	
V_{SENSOR}†		ADC10ON = 1, INCH = 0Ah, T_A = 0°C	2.2 V		986	986±5%	mV
			3 V		986	986±5%	
TC_{SENSOR}†		ADC10ON = 1, INCH = 0Ah	2.2 V		3.55	3.55±3%	mV/°C
			3 V		3.55	3.55±3%	
$t_{SENSOR(sample)}$†	Sample time required if channel 10 is selected (see Note 2)	ADC10ON = 1, INCH = 0Ah, Error of conversion result ≤ 1 LSB	2.2 V	30			µs
			3 V	30			
I_{VMID}	Current into divider at channel 11	ADC10ON = 1, INCH = 0Bh, (see Note 3)	2.2 V			NA	µA
			3 V			NA	
V_{MID}	V_{CC} divider at channel 11	ADC10ON = 1, INCH = 0Bh, V_{MID} is ~0.5 x V_{CC}	2.2 V		1.1	1.1±0.04	V
			3 V		1.5	1.5±0.04	
$t_{ON(VMID)}$	On-time if channel 11 is selected (see Note 4)	ADC10ON = 1, INCH = 0Bh, Error of conversion result ≤ 1 LSB	2.2 V			NA	ns
			3 V			NA	

† Not production tested, limits characterized
‡ Not production tested, limits verified by design

NOTES: 1. The sensor current I_{SENSOR} is consumed if (ADC10ON = 1 and V_{REFON}=1), or (ADC10ON=1 and INCH=0Ah and sample signal is high). Therefore it includes the constant current through the sensor and the reference.
2. The typical equivalent impedance of the sensor is 51 kΩ. The sample time needed is the sensor-on time $t_{SENSOR(ON)}$
3. No additional current is needed. The V_{MID} is used during sampling.
4. The on-time $t_{ON(VMID)}$ is identical to sampling time t_{Sample}; no additional on time is needed.

electrical characteristics over recommended operating free-air temperature (unless otherwise noted) (continued)

JTAG, program memory and fuse

PARAMETER	TEST CONDITIONS		MIN	TYP	MAX	UNIT
$f_{(TCK)}$	TCK frequency, JTAG/test (see Note 3)	V_{CC} = 2.2 V	dc		5	MHz
		V_{CC} = 3 V	dc		10	
$V_{CC(FB)}$	Supply voltage during fuse blow condition	T_A = 25°C	2.5			V
$V_{(FB)}$	Fuse blow voltage (see Notes 1 and 2)		6		7	V
$I_{(FB)}$	Supply current on TEST during fuse blow (see Note 2)				100	mA
$t_{(FB)}$	Time to blow the fuse (see Note 2)				1	ms
$I_{(DD-PGM)}$	Current during program cycle (see Note 4)	V_{CC} = 2.7 V/3.6 V		3	5	mA
$I_{(DD-ERASE)}$	Current during erase cycle (see Note 4)	V_{CC} = 2.7 V/3.6 V		3	7	mA
$t_{(retention)}$	Write/erase cycles		10^4	10^5		
	Data retention T_J = 25°C		100			Year

NOTES: 1. The power source to blow the fuse is applied to TEST pin.
2. Once the JTAG fuse is blown, no further access to the MSP430 JTAG/test feature is possible. The JTAG block is switched to bypass mode.
3. $f_{(TCK)}$ may be restricted to meet the timing requirements of the module selected.
4. Duration of the program/erase cycle is determined by $f_{(FTG)}$ applied to the flash timing controller. It can be calculated as follows:
$t_{(word\ write)} = 35 \times 1/f_{(FTG)}$
$t_{(block\ write,\ byte\ 0)} = 30 \times 1/f_{(FTG)}$
$t_{(block\ write\ byte\ 1-63)} = 20 \times 1/f_{(FTG)}$
$t(block\ write\ end\ sequence) = 6 \times 1/f(FTG)$
$t_{(mass\ erase)} = 5297 \times 1/f_{(FTG)}$
$t_{(segment\ erase)} = 4819 \times 1/f_{(FTG)}$

† Output from USART0 module
‡ Input to USART0 module

APPLICATION INFORMATION

JTAG fuse check mode

MSP430 devices that have the fuse on the TEST terminal have a fuse check mode that tests the continuity of the fuse the first time the JTAG port is accessed after a power-on reset (POR). When activated, a fuse check current, I_{TF}, of 1 mA at 3 V, 2.5 mA at 5 V can flow from the TEST pin to ground if the fuse is not burned. Care must be taken to avoid accidentally activating the fuse check mode and increasing overall system power consumption.

When the TEST pin is taken back low after a test or programming session, the fuse check mode and sense currents are terminated.

Activation of the fuse check mode occurs with the first negative edge on the TMS pin after power up or if TMS is being held low during power up. The second positive edge on the TMS pin deactivates the fuse check mode. After deactivation, the fuse check mode remains inactive until another POR occurs. After each POR the fuse check mode has the potential to be activated.

The fuse check current will only flow when the fuse check mode is active and the TMS pin is in a low state (see Figure 10). Therefore, the additional current flow can be prevented by holding the TMS pin high (default condition).

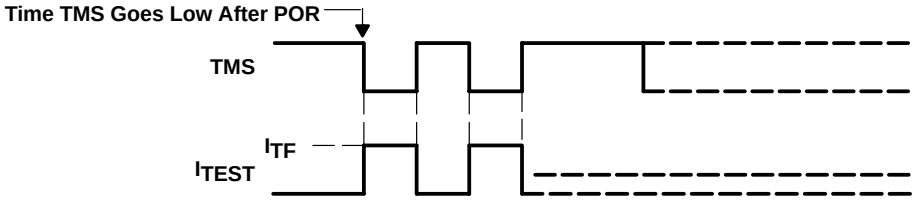

Figure 10. Fuse Check Mode Current, MSP430F11x2, MSP430F12x2

The JTAG pins are terminated internally, and therefore do not require external termination.

NOTE:
The CODE and RAM data protection is ensured if the JTAG fuse is blown and the 256-bit bootloader access key is used. Also, see the *bootstrap loader* section for more information.
