SLVS607–SEPTEMBER 2005

## POWER MANAGEMENT IC FOR LI-ION POWERED SYSTEMS

### FEATURES

- 1.2 A, 97% Efficient Step-Down Converter for System Voltage (VDCDC1)
- 1 A, Up to 95% Efficient Step-Down Converter for Memory Voltage (VDCDC2)
- 800 mA, 90% Efficient Step-Down Converter for Processor Core (VDCDC3)
- 20 mA LDO/Switch for Real Time Clock (VRTC)
- 2 × 50 mA LDO for SRAM and PLL
- Dynamic Voltage Management for Processor Core
- Externally Adjustable Reset Delay Time
- Battery Backup Functionality
- Separate Enable Pins for Inductive Converters
- I<sup>2</sup>C™ Compatible Serial Interface
- 85-μA Quiescent Current
- Low Ripple PFM Mode
- Thermal Shutdown Protection
- Push Button I/O

### APPLICATIONS

- PDA
- Cellular/Smart Phone
- Internet Audio Player
- Digital Still Camera
- Digital Radio Player
- Split Supply DSP and μP Solutions: OMAP1610, OMAP1710, OMAP330
- Intel PXA270, etc.

### DESCRIPTION

The TPS65020 is an integrated Power Management IC for applications powered by one Li-Ion or Li-Polymer cell, and which require multiple power rails. The TPS65020 provides three highly efficient, step-down converters targeted at providing the core voltage, peripheral, I/O and memory rails in a processor based system. All three step-down converters enter a low-power mode at light load for maximum efficiency across the widest possible range of load currents. The TPS65020 also integrates two 50 mA LDO voltage regulators, which are enabled with an external input pin. Each LDO operates with an input voltage range between 1.5 V and 6.5 V, allowing them to be supplied from one of the step-down converters or directly from the main battery. The two 50-mA LDO voltage regulators are intended for use with the SDRAM and PLL power supply in a Intel PXA270 based system. The serial interface is used for dynamic voltage scaling of the core voltage, masking interrupts, or for dis/enabling and setting the LDO output voltages. The interface is compatible with the Fast/Standard mode I<sup>2</sup>C™ specification, allowing transfers at up to 400 kHz.

The TPS65020 incorporates a push button debounced input and latched output for implementation of a push-button turn-on feature, typically required in smartphones or wireless PDAs.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

# TPS65020

SLVS607–SEPTEMBER 2005

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## ORDERING INFORMATION

T <sub>A</sub>	PACKAGE	PART NUMBER <sup>(1)</sup>
–40°C to 85°C	40 pin QFN (RHA)	TPS65020RHA

- (1) The RHA package is available in tape and reel. Add the R suffix (TPS65020RHAR) to order quantities of 2500 parts per reel. Add the T suffix (TPS65020RHAT) to order quantities of 250 parts per reel.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

	VALUE	UNIT
V <sub>I</sub> Input voltage range on all pins except AGND and PGND pins with respect to AGND	–0.3 to 7	V
Current at VINDCDC1, L1, PGND1, VINDCDC2, L2, PGND2, VINDCDC3, L3, PGND3	2000	mA
Peak Current at all other pins	1000	mA
Continuous total power dissipation	See Dissipation Rating Table	
T <sub>A</sub> Operating free-air temperature	–40 to 85	°C
T <sub>J</sub> Maximum junction temperature	125	°C
T <sub>stg</sub> Storage temperature	–65 to 150	°C
Lead temperature 1,6 mm (1/16-inch) from case for 10 seconds	260	°C

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability

## DISSIPATION RATINGS

PACKAGE	T <sub>A</sub> ≤ 25°C POWER RATING	DERATING FACTOR ABOVE T <sub>A</sub> = 25°C	T <sub>A</sub> = 70°C POWER RATING	T <sub>A</sub> = 85°C POWER RATING
RHA <sup>(1)(2)</sup>	2.85 W	28 mW/°C	1.57 W	1.4 W

- (1) The thermal resistance junction to ambient of the RHA package is 32°C/W measured on a high K board.

- (2) The thermal resistance junction to case (exposed pad) of the RHA package is 5°C/W

## RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
V <sub>CC</sub> Input voltage range step-down converters (VINDCDC1, VINDCDC2, VINDCDC3)	2.5		6	V
V <sub>O</sub>	Output voltage range for VDCDC1 step-down convertor <sup>(1)</sup>	0.6	VINDCDC1	V
	Output voltage range for VDCDC2 step-down convertor <sup>(1)</sup>	0.6	VINDCDC2	
	Output voltage range for VDCDC3 (core) step-down convertor <sup>(1)</sup>	0.6	VINDCDC3	
V <sub>I</sub> Input voltage range for LDOs (VINLDO1, VINLDO2)	1.5		6.5	V
V <sub>O</sub> Output voltage range for LDOs (VLDO1, VLDO2)	1		VINLDO1-2	V
I <sub>O(DCDC1)</sub> Output current at L1			1200	mA
Inductor at L1 <sup>(2)</sup>	2.2	3.3		μH
C <sub>I(DCDC1)</sub> Input Capacitor at V <sub>I(DCDC1)</sub> <sup>(2)</sup>	10			μF
C <sub>O(DCDC1)</sub> Output Capacitor at VDCDC1 <sup>(2)</sup>	10	22		μF
I <sub>O(DCDC2)</sub> Output current at L2			1000	mA
Inductor at L2 <sup>(2)</sup>	2.2	3.3		μH

- (1) When using an external resistor divider at DEFDCDC3, DEFDCDC2, DEFDCDC1

- (2) See applications section for more information.

## RECOMMENDED OPERATING CONDITIONS (continued)

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$C_{I(DCDC2)}$	Input Capacitor at $V_{I(DCDC2)}$ <sup>(2)</sup>	10			$\mu\text{F}$
$C_{O(DCDC2)}$	Output Capacitor at $V_{DCDC2}$ <sup>(2)</sup>	10	22		$\mu\text{F}$
$I_{O(DCDC3)}$	Output current at L3			800	mA
	Inductor at L3 <sup>(2)</sup>	2.2	3.3		$\mu\text{H}$
$C_{I(DCDC3)}$	Input Capacitor at $V_{I(DCDC3)}$ <sup>(2)</sup>	10			$\mu\text{F}$
$C_{O(DCDC3)}$	Output Capacitor at $V_{DCDC3}$ <sup>(2)</sup>	10	22		$\mu\text{F}$
$C_{I(VCC)}$	Input Capacitor at VCC <sup>(2)</sup>	1			$\mu\text{F}$
$C_{I(VINLDO)}$	Input Capacitor at VINLDO <sup>(2)</sup>	1			$\mu\text{F}$
$C_{O(VLDO1-2)}$	Output Capacitor at VLDO1, VLDO2 <sup>(2)</sup>	2.2			$\mu\text{F}$
$I_{O(VLDO1-2)}$	Output current at VLDO1, VLDO2			50	mA
$C_{O(VRTC)}$	Output Capacitor at VRTC <sup>(2)</sup>	4.7			$\mu\text{F}$
$T_A$	Operating ambient temperature	-40		85	$^{\circ}\text{C}$
$T_J$	Operating junction temperature	-40		125	$^{\circ}\text{C}$
	Resistor from VINDCDC3, VINDCDC2, VINDCDC1 to VCC used for filtering <sup>(3)</sup>		1	10	$\Omega$

(3) Up to 3 mA can flow into VCC when all 3 converters are running in PWM. This resistor causes the UVLO threshold to be shifted accordingly.

## ELECTRICAL CHARACTERISTICS

VINDCDC1 = VINDCDC2 = VINDCDC3 = VCC = VINLDO = 3.6 V, VBACKUP = 3 V,  $T_A = -40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ , typical values are at  $T_A = 25^{\circ}\text{C}$  (unless otherwise noted)

## DETAILED DESCRIPTION

### VRTC OUTPUT AND OPERATION WITH OR WITHOUT BACKUP BATTERY

The VRTC pin is an always-on output, intended to supply up to 20 mA to a permanently required rail. This is the VCC\_BATT rail of the Intel PXA270 processor for example.

In applications using a backup battery, the backup voltage can be either directly connected to the TPS65020 VBACKUP pin if a Li-Ion cell is used, or via a boost converter (e.g. TPS61070) if a single NiMH battery is used. The voltage applied to the VBACKUP pin is fed through a PMOS switch to the VRTC pin. The TPS65020 asserts the **RESPWRON** signal if VRTC drops below 2.4 V. This, together with 250 mV at 20 mA drop out for the PMOS switch means that the voltage applied at VBACKUP must be greater than 2.65 V for normal system operation.

When the voltage at the VSYSIN pin exceeds 2.65 V, the path from VBACKUP to VRTC is cut, and VRTC is supplied by a similar PMOS switch from the voltage source connected to the VSYSIN input. Typically this is the VDCDC1 converter but can be any voltage source within the appropriate range.

In systems where no backup battery is used, the VBACKUP pin is connected to GND. In this case, a low power LDO is enabled, supplied from VCC and capable of delivering 20 mA to the 3 V output. This LDO is disabled if the voltage at the VSYSIN input exceeds 2.65 V. VRTC is then supplied from the external source connected to this pin as previously described

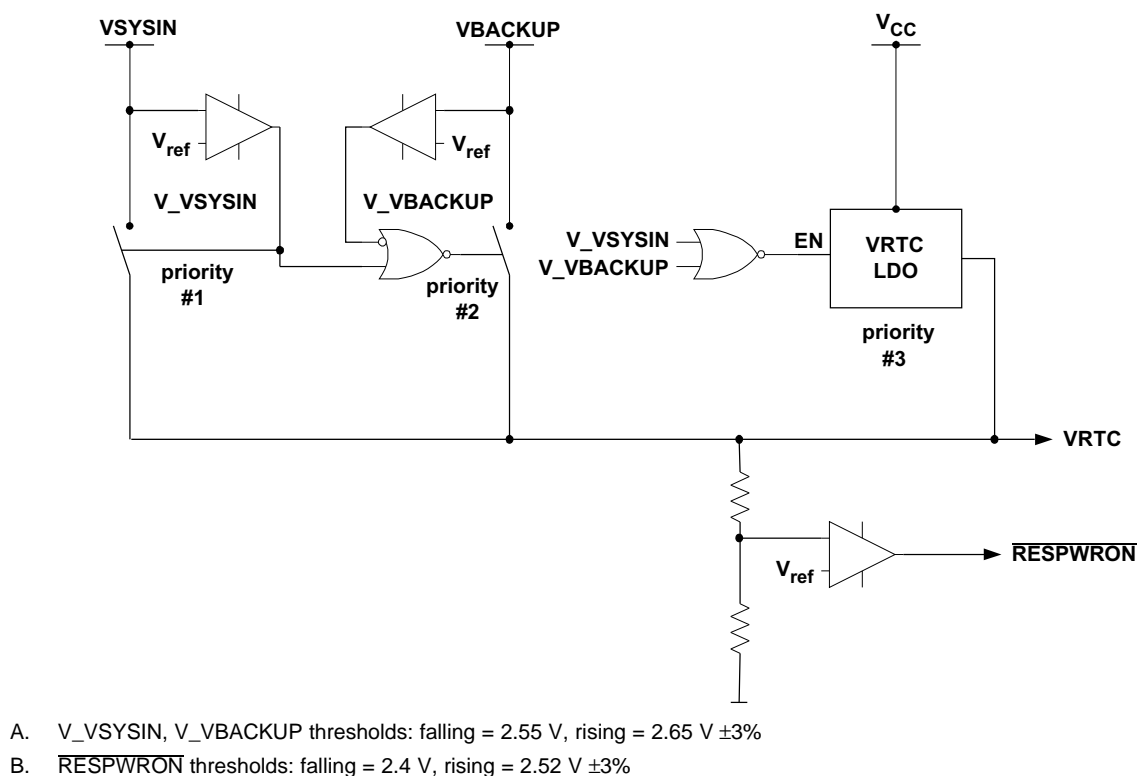

Figure 25.

### STEP-DOWN CONVERTERS, VDCDC1, VDCDC2, and VDCDC3

The TPS65020 incorporates three synchronous step-down converters operating typically at 1.5 MHz fixed frequency pulse width modulation (PWM) at moderate to heavy load currents. At light load currents, the converters automatically enter the power save mode (PSM), and operate with pulse frequency modulation (PFM). The VDCDC1 converter is capable of delivering 1.2 A output current, the VDCDC2 converter is capable of delivering 1 A and the VDCDC3 converter is capable of delivering up to 800 mA.

The converter output voltages can be programmed via the DEFDCDC1, DEFDCDC2 and DEFDCDC3 pins. The

## DETAILED DESCRIPTION (continued)

pins can either be connected to GND, VCC, or to a resistor divider between the output voltage and GND. The VDCDC1 converter defaults to 3 V or 3.3 V depending on the DEFDCDC1 configuration pin. If DEFDCDC1 is tied to ground, the default is 3 V. If it is tied to VCC, the default is 3.3 V. When the DEFDCDC1 pin is connected to a resistor divider, the output voltage can be set in the range of 0.6 V to VINDCDC1 V. See the application information section for more details.

The VDCDC2 converter defaults to 1.8 V or 2.5 V depending on the DEFDCDC2 configuration pin. If DEFDCDC2 is tied to ground, the default is 1.8 V. If it is tied to VCC, the default is 2.5 V. When the DEFDCDC2 pin is connected to a resistor divider, the output voltage can be set in the range of 0.6 V to VINDCDC2 V.

The VDCDC3 converter defaults to 1.3 V or 1.55 V depending on the DEFDCDC3 configuration pin. If DEFDCDC3 is tied to ground the default is 1.3 V. If it is tied to VCC, the default is 1.55 V. When the DEFDCDC3 pin is connected to a resistor divider, the output voltage can be set in the range of 0.6 V to VINDCDC3 V. The core voltage can be reprogrammed via the serial interface in the range of 0.8 V to 1.6 V with a programmable slew rate. The converter is forced into PWM operation whilst any programmed voltage change is underway, whether the voltage is being increased or decreased. The DEFCORE and DEFSLEW registers are used to program the output voltage and slew rate during voltage transitions.

The step-down converter outputs (when enabled) are monitored by power good (PG) comparators, the outputs of which are available via the serial interface. The outputs of the dc-dc converters can be optionally discharged via on-chip 300  $\Omega$  resistors when the dc-dc converters are disabled. This feature can be enabled using the I<sup>2</sup>C interface.

During PWM operation, the converters use a unique fast response voltage mode controller scheme with input voltage feed-forward to achieve good line and load regulation allowing the use of small ceramic input and output capacitors. At the beginning of each clock cycle initiated by the clock signal, the P-channel MOSFET switch is turned on. The inductor current ramps up until the comparator trips and the control logic turns off the switch. The current limit comparator also turns off the switch if the current limit of the P-channel switch is exceeded. After the adaptive dead time used to prevent shoot through current, the N-channel MOSFET rectifier is turned on, and the inductor current ramps down. The next cycle is initiated by the clock signal, again turning off the N-channel rectifier and turning on the P-channel switch.

The three dc-dc converters operate synchronized to each other with the VDCDC1 converter as the master. A 180° phase shift between the VDCDC1 switch turn on and the VDCDC2 and a further 90° shift to the VDCDC3 switch turn on decreases the input RMS current and smaller input capacitors can be used. This is optimized for a typical application where the VDCDC1 converter regulates a Li-Ion battery voltage of 3.7 V to 3.3 V, the VDCDC2 converter from 3.7 V to 2.5 V, and the VDCDC3 converter from 3.7 V to 1.5 V. The phase of the three converters can be changed using the CON\_CTRL register.

## POWER SAVE MODE OPERATION

As the load current decreases, the converters enter the power save mode operation. During PSM, the converters operate in a burst mode (PFM mode) with a switching frequency between half of the switching frequency and switching frequency for one burst cycle. However, the frequency between different burst cycles depends on the actual load current and is typically far less than the switching frequency with a minimum quiescent current to maintain high efficiency.

In order to optimize the converter efficiency at light load, the average current is monitored and if in PWM mode the inductor current remains below a certain threshold, then PSM is entered. The typical threshold to enter PSM is calculated as follows:

**DETAILED DESCRIPTION (continued)**

$$I_{\text{PFMDCDC1 enter}} = \frac{V_{\text{INDCDC1}}}{24}$$

$$I_{\text{PFMDCDC2 enter}} = \frac{V_{\text{INDCDC2}}}{26}$$

$$I_{\text{PFMDCDC3 enter}} = \frac{V_{\text{INDCDC3}}}{39}$$

(1)

During the PSM the output voltage is monitored with a comparator, and by maximum skip burst width. As the output voltage falls below the threshold, set to the nominal  $V_O$ , the P-channel switch turns on and the converter effectively delivers a constant current defined as follows.

$$I_{\text{PFMDCDC1 leave}} = \frac{V_{\text{INDCDC1}}}{18}$$

$$I_{\text{PFMDCDC2 leave}} = \frac{V_{\text{INDCDC2}}}{20}$$

$$I_{\text{PFMDCDC3 leave}} = \frac{V_{\text{INDCDC3}}}{29}$$

(2)

If the load is below the delivered current then the output voltage rises until the same threshold is crossed in the other direction. All switching activity ceases, reducing the quiescent current to a minimum until the output voltage has dropped below the threshold again. If the load current is greater than the delivered current, then the output voltage falls until it crosses the COMP LOW threshold, set to 2% below nominal  $V_O$ , or the skip burst exceeds  $16 \times 1/\text{switching frequency}$ . Power Save Mode is exited and the converter returns to PWM mode.

These control methods reduce the quiescent current to typically 14  $\mu\text{A}$  per converter, and the switching activity to a minimum, thus achieving the highest converter efficiency. Setting the comparator thresholds at the nominal output voltage at light load current results in a low output voltage ripple. The ripple depends on the comparator delay and the size of the output capacitor. Increasing capacitor values makes the output ripple tend to zero. The PSM is disabled through the I<sup>2</sup>C interface to force the individual converters to stay in fixed frequency PWM mode.

**LOW RIPPLE MODE**

Setting Bit 3 in register CON-CTRL to 1 enables the low ripple mode for all of the dc-dc converters if operated in PFM mode. For an output current less than approximately 10 mA, the output voltage ripple in PFM mode is reduced, depending on the actual load current. The lower the actual output current on the converter, the lower the output ripple voltage. For an output current above 10 mA, there is only minor difference in output voltage ripple between PFM mode and low ripple PFM mode. As this feature also increases switching frequency, it is used to keep the switching frequency above the audible range in PFM mode down to a low output current.

**SOFT START**

Each of the three converters has an internal soft start circuit that limits the inrush current during start-up. The soft start is realized by using a very low current to initially charge the internal compensation capacitor. The soft start time is typically 750  $\mu\text{s}$  if the output voltage ramps from 5% to 95% of the final target value. If the output is already precharged to some voltage when the converter is enabled, then this time is reduced proportionally. There is a short delay of typically 170  $\mu\text{s}$  between the converter being enabled and switching activity actually starting. This is to allow the converter to bias itself properly, to recognize if the output is precharged, and if so to prevent discharging of the output while the internal soft start ramp catches up with the output voltage.

## DETAILED DESCRIPTION (continued)

### 100% DUTY CYCLE LOW DROPOUT OPERATION

The TPS65020 converters offer a low input to output voltage difference while still maintaining operation with the use of the 100% duty cycle mode. In this mode the P-channel switch is constantly turned on. This is particularly useful in battery-powered applications to achieve longest operation time by taking full advantage of the whole battery voltage range. The minimum input voltage required to maintain dc regulation depends on the load current and output voltage. It is calculated as:

$$V_{in\_min} = V_{out\_min} + I_{out\_max} \times (r_{DS(on)}^{max} + R_L) \quad (3)$$

with:

$I_{out\_max}$  = maximum load current (Note: ripple current in the inductor is zero under these conditions)

$r_{DS(on)}^{max}$  = maximum P-channel switch  $r_{DS(on)}$

$R_L$  = DC resistance of the inductor

$V_{out\_min}$  = nominal output voltage minus 2% tolerance limit

### ACTIVE DISCHARGE WHEN DISABLED

When the VDCDC1, VDCDC2, and VDCDC3 converters are disabled, due to an UVLO, EN\_x or OVERTEMP condition, it is possible to actively pull down the outputs. This feature is disabled per default and is individually enabled via the CON\_CTRL2 register in the serial interface. When this feature is enabled, the VDCDC1, VDCDC2, and VDCDC3 outputs are discharged by a 300  $\Omega$  (typical) load which is active as long as the converters are disabled.

### POWER GOOD MONITORING

All three step-down converters and both the LDO1 and LDO2 linear regulators have power good comparators. Each comparator indicates when the relevant output voltage has dropped 10% below its target value with 5% hysteresis. The outputs of these comparators are available in the PGOODZ register via the serial interface. An interrupt is generated when any voltage rail drops below the 10% threshold. The comparators are disabled when the converters are disabled and the relevant PGOODZ register bits indicate that power is good.

### LOW DROPOUT VOLTAGE REGULATORS

The low dropout voltage regulators are designed to operate well with low value ceramic input and output capacitors. They operate with input voltages down to 1.5 V. The LDOs offer a maximum dropout voltage of 150 mV at rated output current. Each LDO supports a current limit feature. Both LDOs are enabled by the EN\_LDO pin, both LDOs can be disabled or programmed via the serial interface using the REG\_CTRL and LDO\_CTRL registers. The LDOs also have reverse conduction prevention. This allows the possibility to connect external regulators in parallel in systems with a backup battery. The TPS65020 step-down and LDO voltage regulators automatically power down when the VBAT voltage drops below the UVLO threshold or when the junction temperature rises above 160°C.

### UNDERVOLTAGE LOCKOUT

The undervoltage lockout circuit for the five regulators on the TPS65020 prevents the device from malfunctioning at low-input voltages and from excessive discharge of the battery. It disables the converters and LDOs. The UVLO circuit monitors the VCC pin, the threshold is set internally to 2.35 V with 5% (120 mV) hysteresis. Note that when any of the dc-dc converters are running, there is an input current at the VCC pin, which is up to 3 mA when all three converters are running in PWM mode. This current needs to be taken into consideration if an external RC filter is used at the VCC pin to remove switching noise from the TPS65020 internal analog circuitry supply.

### POWER-UP SEQUENCING

The TPS65020 power-up sequencing is designed to be entirely flexible and customer driven. This is achieved by providing separate enable pins for each switch-mode converter, and a common enable signal for the LDOs. The relevant control pins are described in [Table 2](#).

**DETAILED DESCRIPTION (continued)****Table 2. Control Pins and Status Outputs for DC-DC Converters**

PIN NAME	INPUT OUTPUT	FUNCTION
DEFDCDC3	I	Defines the default voltage of the VDCDC3 switching converter. DEFDCDC3 = 0 defaults VDCDC3 to 1.3 V, DEFDCDC3 = VCC defaults VDCDC3 to 1.55 V.
DEFDCDC2	I	Defines the default voltage of the VDCDC2 switching converter. DEFDCDC2 = 0 defaults VDCDC2 to 1.8 V, DEFDCDC2 = VCC defaults VDCDC2 to 2.5 V.
DEFDCDC1	I	Defines the default voltage of the VDCDC1 switching converter. DEFDCDC1 = 0 defaults VDCDC1 to 3 V, DEFDCDC1 = VCC defaults VDCDC1 to 3.3 V.
DCDC3_EN	I	Set DCDC3_EN = 0 to disable and DCDC3_EN = 1 to enable the VDCDC3 converter
DCDC2_EN	I	Set DCDC2_EN = 0 to disable and DCDC2_EN = 1 to enable the VDCDC2 converter
DCDC1_EN	I	Set DCDC1_EN = 0 to disable and DCDC1_EN = 1 to enable the VDCDC1 converter
HOT_RESET	I	The <b>HOT_RESET</b> pin generates a reset ( <b>RESPWRON</b> ) for the processor. <b>HOT_RESET</b> does not alter any TPS65020 settings except the output voltage of VDCDC3. Activating <b>HOT_RESET</b> sets the voltage of VDCDC3 to its default value defined with the DEFDCDC3 pin. A 1 M $\Omega$ pull-up resistor to VCC is integrated in TPS65020. <b>HOT_RESET</b> is internally de-bounced by the TPS65020.
RESPWRON	O	<b>RESPWRON</b> is held low when power is initially applied to the TPS65020. The VRTC voltage is monitored: <b>RESPWRON</b> is low when VRTC < 2.4 V and remains low for a time defined by the external capacitor at the TRESPWRON pin. <b>RESPWRON</b> can also be forced low by activation of the <b>HOT_RESET</b> pin.
TRESPWRON	I	Connect a capacitor here to define the RESET time at the <b>RESPWRON</b> pin. 1 nF typically gives 100 ms.

**SYSTEM RESET + CONTROL SIGNALS**

The **RESPWRON** signal can be used as a global reset for the application. It is an open drain output. The **RESPWRON** signal is generated according to the power good comparator of VRTC, and remains low for  $t_{nrespwron}$  seconds after VRTC has risen above 2.52 V (falling threshold is 2.4 V, 5% hysteresis).  $t_{nrespwron}$  is set by an external capacitor at the TRESPWRON pin. 1 nF gives typically 100 ms. **RESPWRON** is also triggered by the **HOT\_RESET** input. This input is internally debounced, with a filter time of typically 30 ms.

The **PWRFAIL** and **LOW\_BAT** signals are generated by two voltage detectors using the PWRFAIL\_SNS and LOWBAT\_SNS input signals. Each input signal is compared to a 1 V threshold (falling edge) with 5% (50 mV) hysteresis.

The VDCDC3 converter is reset to its default output voltage defined by the DEFDCDC3 input, when **HOT\_RESET** is asserted. Other I<sup>2</sup>C registers are not affected. Generally, the VDCDC3 converter is set to its default voltage with one of these conditions: **HOT\_RESET** active, VRTC lower than its threshold voltage, undervoltage lockout (UVLO) condition, **RESPWRON** active, both VDCDC3-converter AND VDCDC1-converter disabled. In addition, the voltage of VDCDC3 changes to 1xxx0, if the VDCDC1 converter is disabled. Where xxx is the state before VDCDC1 was disabled.

**PB\_IN and PB\_OUT**

In the TPS65020 the PB\_IN pin is defined as an input. It is active high and debounces the input signal. For example from a push button, before passing it to a latch associated with PB\_OUT (active low). This feature allows the implementation of a push-button on-off-switch. PB\_OUT is actively pulled low per default. See the application information section.

**Interrupt Management and the  $\overline{\text{INT}}$  Pin**

The  $\overline{\text{INT}}$  pin combines the outputs of the PGOOD comparators from each dc-dc converter and LDOs. The  $\overline{\text{INT}}$  pin is used as a POWER\_OK pin indicating when all enabled supplies are in regulation. If the PGOODZ register is read via the serial interface, any active bits are then blocked from the  $\overline{\text{INT}}$  output pin.

Interrupts can be masked using the MASK register; default operation is not to mask any interrupts since this gives the simple POWER\_OK function.

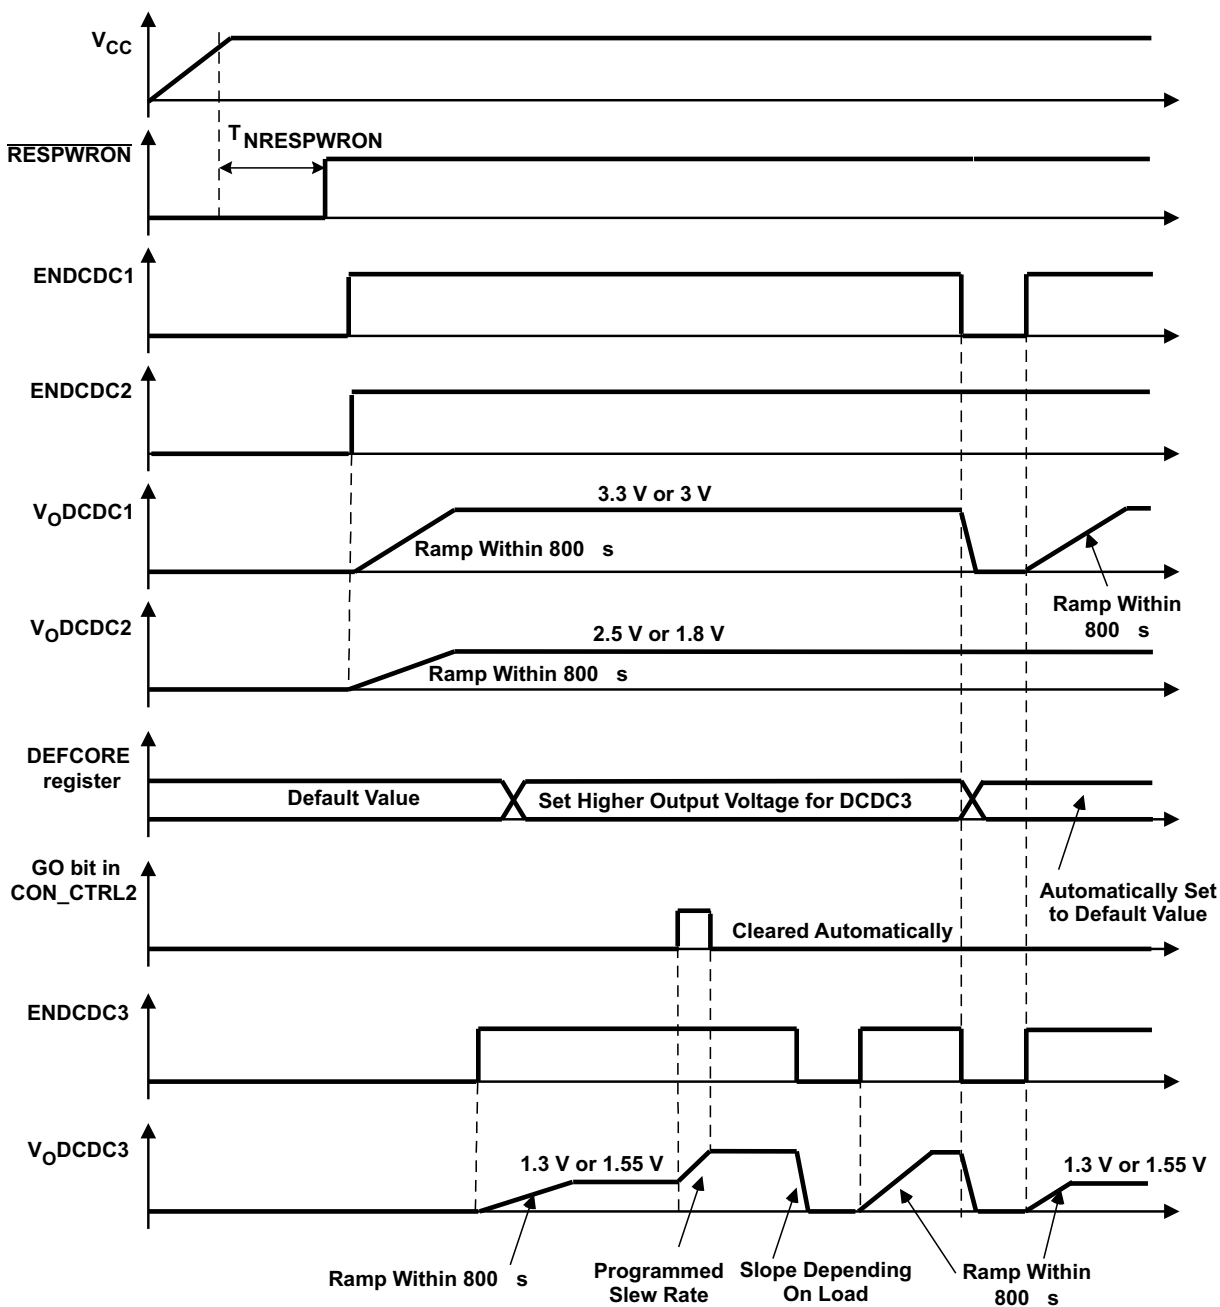

Figure 28. DVS Timing

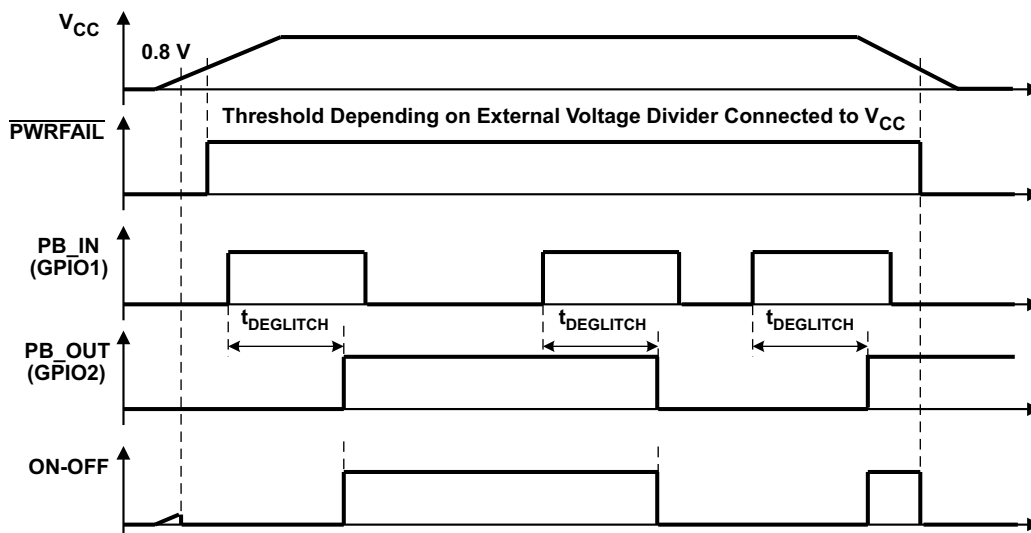

Figure 29. PB-ON-OFF Timing

## SERIAL INTERFACE

The serial interface is compatible with the standard and fast mode I<sup>2</sup>C specifications, allowing transfers at up to 400 kHz. The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements and charger status to be monitored. Register contents remain intact as long as VCC remains above 2 V. The TPS65020 has a 7bit address: 1001000, other addresses are available upon contact with the factory. Attempting to read data from the register addresses not listed in this section results in FFh being read out.

For normal data transfer, DATA is allowed to change only when CLK is low. Changes when CLK is high are reserved for indicating the start and stop conditions. During data transfer, the data line must remain stable whenever the clock line is high. There is one clock pulse per bit of data. Each data transfer is initiated with a start condition and terminated with a stop condition. When addressed, the TPS65020 device generates an acknowledge bit after the reception of each byte. The master device (microprocessor) must generate an extra clock pulse that is associated with the acknowledge bit. The TPS65020 device must pull down the DATA line during the acknowledge clock pulse so that the DATA line is a stable low during the high period of the acknowledge clock pulse. The DATA line is a stable low during the high period of the acknowledge-related clock pulse. Setup and hold times must be taken into account. During read operations, a master must signal the end of data to the slave by not generating an acknowledge bit on the last byte that was clocked out of the slave. In this case, the slave TPS65020 device must leave the data line high to enable the master to generate the stop condition.

1 = indicates that the PWRFAIL\_SNS input voltage is below the 1-V threshold.

**Bit 6 LOWBATTZ:**

0 = indicates that the LOWBATT\_SNS input voltage is above the 1-V threshold.

1 = indicates that the LOWBATT\_SNS input voltage is below the 1-V threshold.

**Bit 5 PGOODZ VDCDC1:**

0 = indicates that the VDCDC1 converter output voltage is within its nominal range. This bit is zero if the VDCDC1 converter is disabled.

1 = indicates that the VDCDC1 converter output voltage is below its target regulation voltage

**Bit 4 PGOODZ VDCDC2:**

0 = indicates that the VDCDC2 converter output voltage is within its nominal range. This bit is zero if the VDCDC2 converter is disabled.

1 = indicates that the VDCDC2 converter output voltage is below its target regulation voltage

**Bit 3 PGOODZ VDCDC3:**

0 = indicates that the VDCDC3 converter output voltage is within its nominal range. This bit is zero if the VDCDC3 converter is disabled and during a DVM controlled output voltage transition

1 = indicates that the VDCDC3 converter output voltage is below its target regulation voltage

**Bit 2 PGOODZ LDO2:**

0 = indicates that the LDO2 output voltage is within its nominal range. This bit is zero if LDO2 is disabled.

1 = indicates that LDO2 output voltage is below its target regulation voltage

**Bit 1 PGOODZ LDO1**

0 = indicates that the LDO1 output voltage is within its nominal range. This bit is zero if LDO1 is disabled.

1 = indicates that the LDO1 output voltage is below its target regulation voltage

The MASK register can be used to mask particular fault conditions from appearing at the  $\overline{\text{INT}}$  pin. MASK<n> = 1 masks PGOODZ<n>.

**MASK. Register Address: 02h (read/write) Default Value: C0h**

MASK	B7	B6	B5	B4	B3	B2	B1	B0

The CON\_CTRL register is used to force any or all of the converters into forced PWM operation, when low output voltage ripple is vital. It is also used to control the phase shift between the three converters in order to minimize the input rms current, hence reduce the required input blocking capacitance. The DCDC1 converter is taken as the reference and consequently has a fixed zero phase shift.

**CON\_CTRL. Register Address: 04h (read/write)      Default Value: B0h**

CON_CTRL	B7	B6	B5	B4	B3	B2	B1	B0
Bit name and function	DCDC2 PHASE1	DCDC2 PHASE0	DCDC3 PHASE1	DCDC3 PHASE0	LOW RIPPLE	FPWM DCDC2	FPWM DCDC1	FPWM DCDC3
Default	1	0	1	1	0	0	0	0
Default value loaded by:	UVLO	UVLO	UVLO	UVLO	UVLO	UVLO	UVLO	UVLO
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

CON_CTRL<7:6>	DCDC2 CONVERTER DELAYED BY		CON_CTRL<5:4>	DCDC3 CONVERTER DELAYED BY
00	zero		00	zero
01	1/4 cycle		01	1/4 cycle
<b>10</b>	<b>½ cycle</b>		<b>10</b>	<b>½ cycle</b>
11	3/4 cycle		<b>11</b>	<b>3/4 cycle</b>

Bit 3    LOW RIPPLE:

- 0 =    Skip mode operation optimized for high efficiency for all converters
- 1 =    Skip mode operation optimized for low output voltage ripple for all converters

Bit 2    FPWM DCDC2:

- 0 =    DCDC2 converter operates in PWM / PFM mode
- 1 =    DCDC2 converter is forced into fixed frequency PWM mode

Bit 1    FPWM DCDC1:

- 0 =    DCDC1 converter operates in PWM / PFM mode
- 1 =    DCDC1 converter is forced into fixed frequency PWM mode

Bit 0    FPWM DCDC3:

- 0 =    DCDC3 converter operates in PWM / PFM mode
- 1 =    DCDC3 converter is forced into fixed frequency PWM mode

The CON\_CTRL2 register can be used to take control the inductive converters.

**CON\_CTRL. Register Address: 05h (read/write)      Default Value: 40h**

CON_CTRL2	B7	B6	B5	B4	B3	B2	B1	B0
Bit name and function	GO	Core adj allowed				DCDC2 discharge	DCDC1 discharge	DCDC3 discharge
Default	0	1	0	0	0	0	0	0
Default value loaded by:	UVLO + DONE	UVLO				UVLO	UVLO	UVLO
Read/Write	R/W	R/W				R/W	R/W	R/W

Bit 7      GO:

- 0 = no change in the output voltage for the DCDC3 converter
- 1 = the output voltage of the DCDC3 converter is changed to the value defined in DEFCORE with the slew rate defined in DEFSLEW. This bit is automatically cleared when the DVM transition is complete. The transition is considered complete in this case when the desired output voltage code has been reached, not when the VDCDC3 output voltage is actually in regulation at the desired voltage.

Bit 6      CORE ADJ Allowed:

- 0 = the output voltage is set with the I<sup>2</sup>C register
- 1 = DEFDCDC3 is either connected to GND or VCC or an external voltage divider. When connected to GND or VCC, VDCDC3 defaults to 1.3 V or 1.55 V respectively at start-up

Bit 2– 0      0 = the output capacitor of the associated converter is not actively discharged when the converter is disabled

- 1 = the output capacitor of the associated converter is actively discharged when the converter is disabled. This decreases the fall time of the output voltage at light load

**DEFCORE. Register Address: 06h (read/write)      Default Value: 14h/1Eh**

DEFCORE	B7	B6	B5	B4	B3	B2	B1	B0
Bit name and function				CORE4	CORE3	CORE2	CORE1	CORE0

## DESIGN PROCEDURE

### Inductor Selection for the DC-DC Converters

Each of the converters in the TPS65020 typically use a 3.3 µH output inductor. Larger or smaller inductor values are used to optimize the performance of the device for specific operation conditions. The selected inductor has to be rated for its dc resistance and saturation current. The dc resistance of the inductance influences directly the efficiency of the converter. Therefore, an inductor with lowest dc resistance should be selected for highest efficiency.

For a fast transient response, a 2.2-µH inductor in combination with a 22-µF output capacitor is recommended.

[Equation 4](#) calculates the maximum inductor current under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current as calculated with [Equation 4](#). This is needed because during heavy load transient the inductor current rises above the value calculated under [Equation 4](#).

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \quad (4)$$

$$I_{Lmax} = I_{outmax} + \frac{\Delta I_L}{2} \quad (5)$$

with:

f = Switching Frequency (1.5 MHz typical)

L = Inductor Value

ΔI<sub>L</sub> = Peak-to-Peak inductor ripple current

I<sub>LMAX</sub> = Maximum Inductor current

The highest inductor current occurs at maximum V<sub>in</sub>.

Open core inductors have a soft saturation characteristic, and they can usually handle higher inductor currents versus a comparable shielded inductor.

A more conservative approach is to select the inductor current rating just for the maximum switch current of the TPS65020 (2 A for the VDCDC1 and VDCDC2 converters, and 1.3 A for the VDCDC3 converter). The core material from inductor to inductor differs and has an impact on the efficiency especially at high switching frequencies.

See [Table 3](#) and the typical applications for possible inductors.

**Table 3. Tested Inductors**

DEVICE	INDUCTOR VALUE	TYPE	COMPONENT SUPPLIER
DCDC3 converter	3.3 µH	CDRH2D14NP-3R3	Sumida
	3.3 µH	LPS3010-332	Coilcraft
	3.3 µH	VLF4012AT-3R3M1R3	TDK
	2.2 µH	VLF4012AT-2R2M1R5	TDK
	2.2 µH	NR3015T2R2	Taiyo-Yuden
DCDC2 converter	3.3 µH	CDRH2D18/HPNP-3R3	Sumida
	3.3 µH	VLF4012AT-3R3M1R3	TDK
	2.2 µH	VLCF4020-2R2	TDK
DCDC1 converter	3.3 µH	CDRH3D14/HPNP-3R2	Sumida
	3.3 µH	CDRH4D28C-3R2	Sumida
	3.3 µH	MSS5131-332	Coilcraft
	2.2 µH	VLCF4020-2R2	TDK

### Output Capacitor Selection

The advanced Fast Response voltage mode control scheme of the inductive converters implemented in the TPS65020 allow the use of small ceramic capacitors with a typical value of 10 µF for a 3.3-µH inductor for each converter without having large output voltage under and overshoots during heavy load transients.

For a fast transient response a 22-µF capacitor with a 2.2-µH inductor should be used on each converter.

Ceramic capacitors having low ESR values have the lowest output voltage ripple and are recommended. See [Table 4](#) for recommended components.

If ceramic output capacitors are used, the capacitor RMS ripple current rating always meets the application requirements. Just for completeness, the RMS ripple current is calculated as:

$$I_{\text{RMSCout}} = \frac{1 - \frac{V_{\text{out}}}{V_{\text{in}}}}{L \times f} \times \frac{1}{2 \times \sqrt{3}} \quad (6)$$

At nominal load current, the inductive converters operate in PWM mode. The overall output voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor:

$$I_{\text{RMSCout}} = \frac{1 - \frac{V_{\text{out}}}{V_{\text{in}}}}{L \times f} \times \left( \frac{1}{8 \times C_{\text{out}} \times f} + \text{ESR} \right) \quad (7)$$

Where the highest output voltage ripple occurs at the highest input voltage  $V_{\text{in}}$ .

At light load currents, the converters operate in PSM and the output voltage ripple is dependent on the output capacitor value. The output voltage ripple is set by the internal comparator delay and the external capacitor. The typical output voltage ripple is less than 1% of the nominal output voltage.

### Input Capacitor Selection

Because of the nature of the buck converter having a pulsating input current, a low ESR input capacitor is required for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes. Each dc-dc converter requires a 10-µF ceramic input capacitor on its input pin VINDCDCx. The input capacitor is increased without any limit for better input voltage filtering. The VCC pin is separated from the input for the dc-dc converters. A filter resistor of up to 10R and a 1-µF capacitor is used for decoupling the VCC pin from switching noise. Note that the filter resistor may affect the UVLO threshold since up to 3 mA can flow via this resistor into the VCC pin when all converters are running in PWM mode.

**Table 4. Possible Capacitors**

CAPACITOR VALUE	CASE SIZE	COMPONENT SUPPLIER	COMMENTS
22 $\mu$ F	1206	TDK C3216X5R0J226M	Ceramic
22 $\mu$ F	1206	Taiyo Yuden JMK316BJ226ML	Ceramic
10 $\mu$ F	0805	Taiyo Yuden JMK212BJ106M	Ceramic
10 $\mu$ F	0805	TDK C2012X5R0J106M	Ceramic
22 $\mu$ F	0805	TDK C2012X5R0J226MT	Ceramic
22 $\mu$ F	0805	Taiyo Yuden JMK212BJ226MG	Ceramic

### Output Voltage Selection

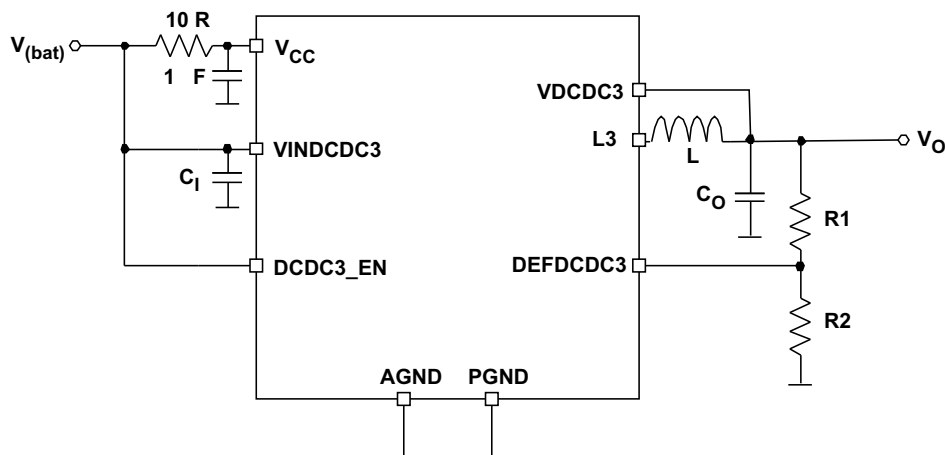

The DEFDCDC1, DEFDCDC2, and DEFDCDC3 pins are used to set the output voltage for each step-down converter. See the table for the default voltages if the pins are pulled to GND or to VCC. If a different voltage is needed, an external resistor divider can be added to the DEFDCDCx pin as shown in [Table 5](#).

The output voltage of VDCDC3 is set with the I<sup>2</sup>C interface. If the voltage is changed from the default, using the DEFCORE register, the output voltage only depends on the register value. Any resistor divider at DEFDCDC3 does not change the voltage set with the register. Bit B6 in the CON\_CTRL2 register is used to switch between the internal voltage setting or the voltage set with the external DEFDCDC3 pin for the VDCDC3 converter.

**Table 5.**

PIN	LEVEL	DEFAULT OUTPUT VOLTAGE
DEFDCDC1	VCC	3.3 V
	GND	3 V
DEFDCDC2	VCC	2.5 V
	GND	1.8 V
DEFDCDC3	VCC	1.55 V
	GND	1.3 V

Using an external resistor divider at DEFDCDCx:

When a resistor divider is connected to DEFDCDCx, the output voltage can be set from 0.6 V up to the input voltage  $V_{(bat)}$ . The total resistance ( $R1+R2$ ) of the voltage divider should be kept in the 1-MR range in order to maintain a high efficiency at light load.

$$V_{(DEFDCDCx)} = 0.6 \text{ V}$$

$$V_{OUT} = V_{DEFDCDC3} \times \frac{R1 + R2}{R2} \qquad R1 = R2 \times \left( \frac{V_{OUT}}{V_{DEFDCDC3}} \right) - R2 \qquad (8)$$

### VRTC Output

The VRTC output is typically connected to the Vcc\_Batt pin of a Intel PXA270 processor. During power-up of the processor, the TPS65020 internally switches from the LDO or the backup battery to the system voltage connected at the VSYSIN pin (see [Figure 25](#)). It is recommended to add a capacitor of 4.7-μF minimum to the VRTC pin.

### LDO1 and LDO2

The LDOs default voltage is 1.1 V for LDO2 and 1.3 V for LDO1. They are intended to provide power to VCC\_PLL and the VCC\_SRAM pin on a PXA270 processor. The minimum output capacitor required is 2.2 μF. The LDOs output voltage is changed to different voltages between 1 V and 3.3 V using the I<sup>2</sup>C interface. Therefore, they can also be used as general-purpose LDOs in applications powering processors different from PXA270. The supply voltage for the LDOs needs to be connected to the VINLDO pin, giving the flexibility to connect the lowest voltage available in the system, and providing the highest efficiency.

### Trespwron

This is the input to a capacitor that defines the reset delay time after the voltage at VRTC rises above 2.52 V. The timing is generated by charging and discharging the capacitor with a current of 2 μA between a threshold of 0.25 V and 1 V for 128 cycles. A 1-nF capacitor gives a delay time of 100 ms.

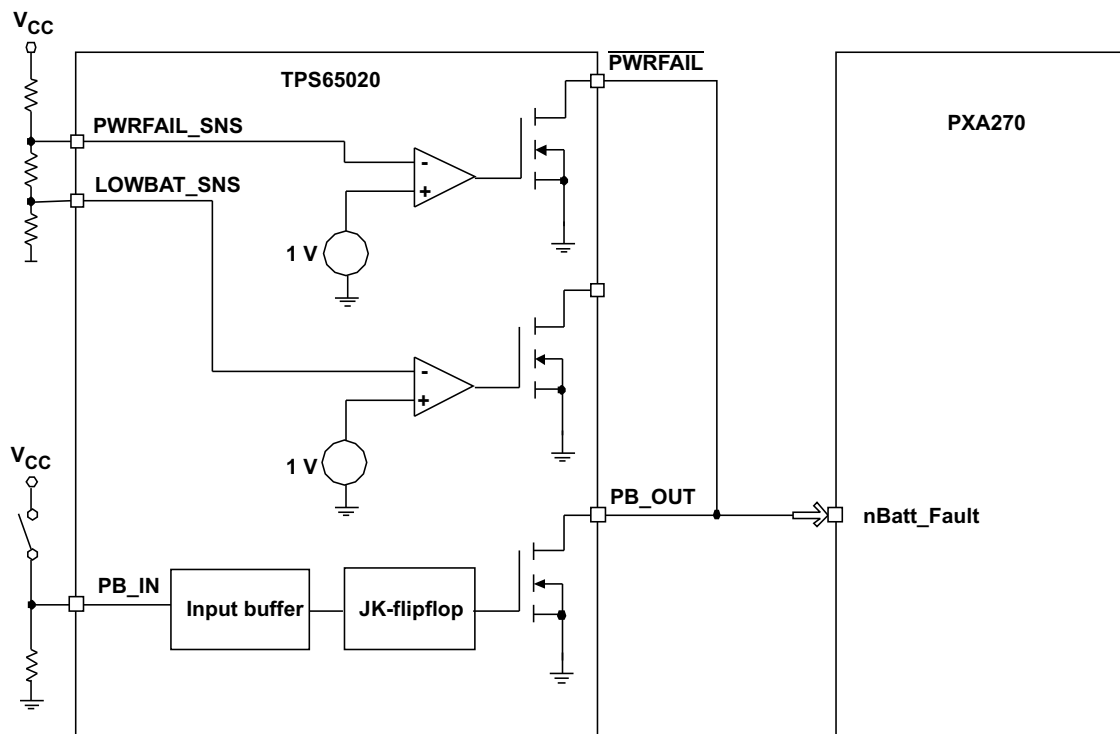

### Vcc-Filter

An RC filter connected at the VCC input is used to keep noise from the internal supply for the bandgap and other analog circuitry. A typical value of 10R and 1 μF is used to filter the switching spikes, generated by the dc-dc converters. A larger resistor than 10R should not be used because the current into VCC of up to 3 mA causes a voltage drop at the resistor causing the undervoltage lockout circuitry connected at VCC internally to switch off too early.

## APPLICATION INFORMATION

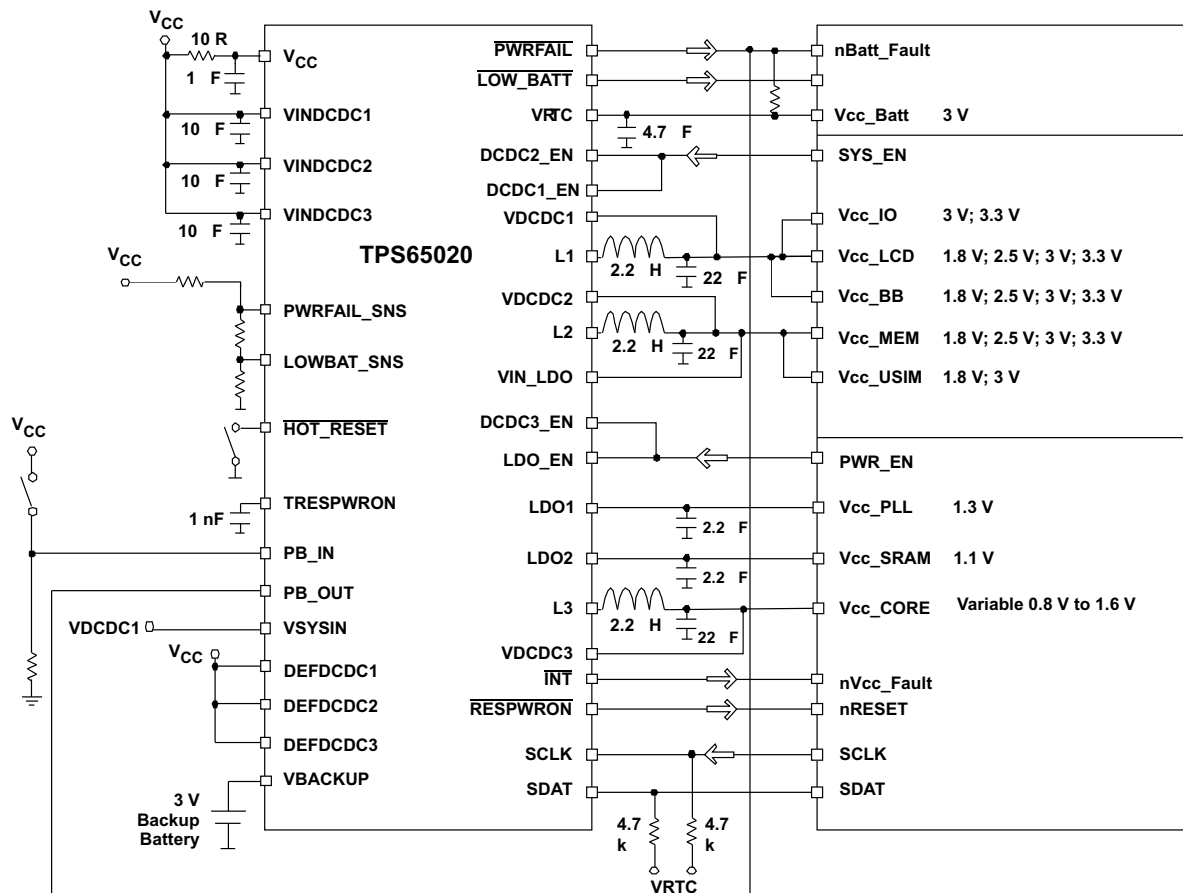

### IMPLEMENTING A PUSH-BUTTON ON-OFF FUNCTION USING PB\_IN AND PB\_OUT

In mobile phone applications, usually the device must not automatically power up when the battery is inserted. Such a function can be implemented using PB\_IN and PB\_OUT. After the main battery is inserted, the PB\_OUT open drain output is low. When this pins is connected with PWRFAIL, the signal is pulled low, preventing Intel PXA270 to start up.

# APPLICATION INFORMATION (continued)

## TYPICAL CONFIGURATION FOR THE Intel Bulverde PROCESSOR

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB), the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to a ground plane or special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

TPS65020RHATG4	ACTIVE	QFN	RHA	40	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
