

3V electronic governor BA6235F

The BA6235F is an IC for controlling the speed of low voltage DC motors. It consists of a reference voltage generator, current multiplier, and DC amplifier. The speed of DC motor is controlled by detecting the counter-electromotive force generated by the motor. Various DC motors can be driven by changing the external CR time constants.

● Applications

- 3V radio cassette tape recorders
- Micro-cassette tape recorders

● Features

- 1) Wide range of operating voltage. (1.8 ~ 5V)
- 2) Low current consumption. ($I_Q = 2.0\text{mA}$)
- 3) Various DC motors can be driven by changing the external CR time constants.

● Absolute maximum ratings ($T_a = 25^\circ\text{C}$)
