

# ±15kV ESD-Protected, 1µA, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

## General Description

The MAX3224E/MAX3225E/MAX3226E/MAX3227E/MAX3244E/MAX3245E are 3V-powered EIA/TIA-232 and V.28/V.24 communications interfaces with automatic shutdown/wakeup features, high data-rate capabilities, and enhanced electrostatic discharge (ESD) protection. All transmitter outputs and receiver inputs are protected to ±15kV using IEC 1000-4-2 Air-Gap Discharge, ±8kV using IEC 1000-4-2 Contact Discharge, and ±15kV using the Human Body Model.

All devices achieve a 1µA supply current using Maxim's revolutionary AutoShutdown Plus™ feature. These devices automatically enter a low-power shutdown mode when the RS-232 cable is disconnected or the transmitters of the connected peripherals are inactive, and the UART driving the transmitter inputs is inactive for more than 30 seconds. They turn on again when they sense a valid transition at any transmitter or receiver input. AutoShutdown Plus saves power without changes to the existing BIOS or operating system.

The MAX3225E/MAX3227E/MAX3245E also feature MegaBaud™ operation, guaranteeing 1Mbps for high-speed applications such as communicating with ISDN modems. The MAX3224E/MAX3226E/MAX3244E guarantee 250kbps operation. The transceivers have a proprietary low-dropout transmitter output stage enabling true RS-232 performance from a +3.0V to +5.5V supply with a dual charge pump. The charge pump requires only four small 0.1µF capacitors for operation from a 3.3V supply. The MAX3224E-MAX3227E feature a logic-level output (READY) that asserts when the charge pump is regulating and the device is ready to begin transmitting.

All devices are available in a space-saving SSOP package.

## Applications

- Notebook, Subnotebook, and Palmtop Computers
- Cellular Phones
- Battery-Powered Equipment
- Hand-Held Equipment
- Peripherals
- Printers

AutoShutdown Plus and MegaBaud are trademarks of Maxim Integrated Products.

† Covered by U.S. Patent numbers 4,636,930; 4,679,134; 4,777,577; 4,797,899; 4,809,152; 4,897,774; 4,999,761; 5,649,210; and other patents pending.

## Features

- ◆ ESD Protection for RS-232 I/O Pins:
  - ±15kV—Human Body Model
  - ±8kV—IEC1000-4-2, Contact Discharge
  - ±15kV—IEC1000-4-2, Air-Gap Discharge
- ◆ Latchup Free
- ◆ 1µA Supply Current
- ◆ AutoShutdown Plus—EDN Innovation of the Year
- ◆ Guaranteed Data Rate:
  - 250kbps (MAX3224E/3226E/3244E)
  - 1Mbps (MAX3225E/3227E/3245E)
- ◆ Guaranteed Slew Rate:
  - 6V/µs (MAX3224E/3226E/3244E)
  - 24V/µs (MAX3225E/3227E/3245E)
- ◆ Meets EIA/TIA-232 Specifications Down to 3.0V
- ◆ Guaranteed Mouse Driveability (MAX3244E/3245E)
- ◆ Ready-to-Transmit Logic-Level Output

**Note 1:** V+ and V- can have maximum magnitudes of 7V, but their absolute difference cannot exceed 13V.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Pin Description

PIN			NAME	FUNCTION
MAX3224E MAX3225E	MAX3226E MAX3227E	MAX3244E MAX3245E		
1	1	—	READY	Ready to Transmit Output, active-high. READY is enabled high when V- goes below -4V and the device is ready to transmit.
2	2	28	C1+	Positive Terminal of Voltage-Doubler Charge-Pump Capacitor
3	3	27	V+	+5.5V generated by the charge pump
4	4	24	C1-	Negative Terminal of Voltage-Doubler Charge-Pump Capacitor
5	5	1	C2+	Positive Terminal of Inverting Charge-Pump Capacitor
6	6	2	C2-	Negative Terminal of Inverting Charge-Pump Capacitor
7	7	3	V-	-5.5V generated by the charge pump
8, 17	13	9–11	T_OUT	RS-232 Transmitter Outputs
9, 16	8	4–8	R_IN	RS-232 Receiver Inputs
10, 15	9	15–19	R_OUT	TTL/CMOS Receiver Outputs
11	10	21	$\overline{\text{INVALID}}$	Valid Signal Detector Output, active low. A logic high indicates that a valid RS-232 level is present on a receiver input.
12, 13	11	12–14	T_IN	TTL/CMOS Transmitter Inputs
14	12	23	FORCEON	Force-On Input, active high. Drive high to override AutoShutdown Plus, keeping transmitters and receivers on ( $\overline{\text{FORCEOFF}}$ must be high) (Table 1).
18	14	25	GND	Ground
19	15	26	V <sub>CC</sub>	+3.0V to +5.5V Single Supply Voltage
20	16	22	$\overline{\text{FORCEOFF}}$	Force-Off Input, active low. Drive low to shut down transmitters, receivers (except R2OUTB), and charge pump. This overrides AutoShutdown Plus and FORCEON (Table 1).
—	—	20	R2OUTB	TTL/CMOS Noninverting Complementary Receiver Outputs. Always active.

## Detailed Description

### Dual Charge-Pump Voltage Converter

The MAX3224E-MAX3227E/MAX3244E/MAX3245E's internal power supply consists of a regulated dual charge pump that provides output voltages of +5.5V (doubling charge pump) and -5.5V (inverting charge pump), over the +3.0V to +5.5V range. The charge pump operates in discontinuous mode: if the output voltages are less than 5.5V, the charge pump is enabled; if the output voltages exceed 5.5V, the charge-pump is disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies.

The READY output (MAX3224E-MAX3227E) is low when the charge pumps are disabled in shutdown mode. The READY signal asserts high when V- goes below -4V.

### RS-232 Transmitters

The transmitters are inverting level translators that convert CMOS-logic levels to 5.0V EIA/TIA-232 levels. The MAX3224E/MAX3226E/MAX3244E guarantee a 250kbps data rate (1Mbps, for the MAX3225E / MAX3227E / MAX3245E) with worst-case loads of 3kΩ in parallel with 1000pF, providing compatibility with PC-to-PC com-

LapLink is a trademark of Traveling Software.

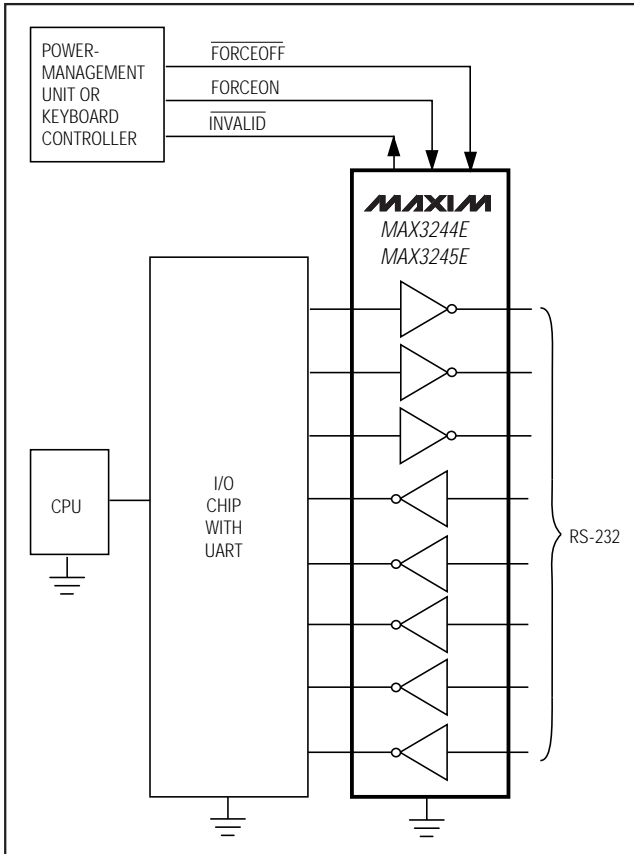

Figure 1. Interface Under Control of PMU

munication software (such as LapLink™). Transmitters can be paralleled to drive multiple receivers. Figure 1 shows a complete system connection.

When  $\overline{\text{FORCEOFF}}$  is driven to ground or when the Auto-Shutdown Plus circuitry senses that all receiver and transmitter inputs are inactive for more than 30sec, the transmitters are disabled and the outputs go into a high-impedance state. When powered off or shut down, the outputs can be driven to  $\pm 12\text{V}$ . The transmitter inputs do not have pull-up resistors. Connect unused inputs to GND or  $V_{CC}$ .

### RS-232 Receivers

The receivers convert RS-232 signals to CMOS-logic output levels. The MAX3224E-MAX3227E feature inverting outputs that always remain active (Table 1). The MAX3244E/MAX3245E have inverting three-state

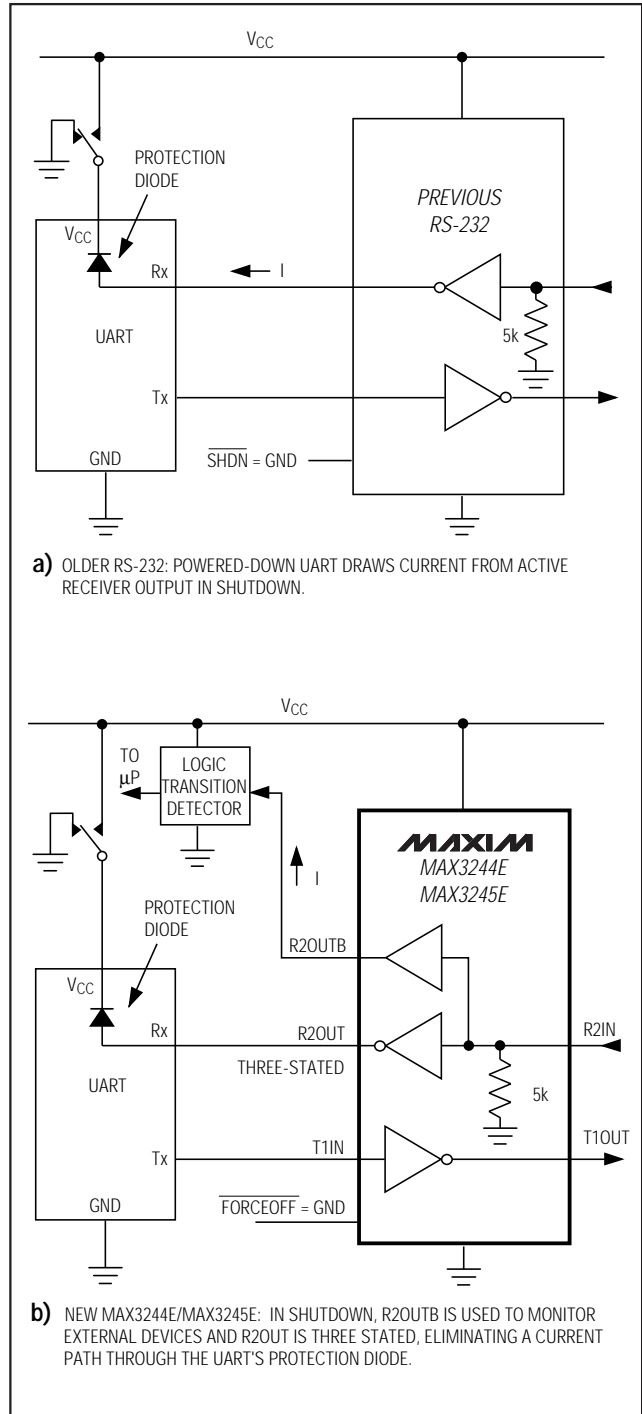

Figure 2. The MAX3244E/MAX3245E detect RS-232 activity when the UART and interface are shut down.

Shutdown (AutoShutdown)	$\overline{\text{INVALID}}^*$	$\overline{\text{INVALID}}^{**}$	No	X	High-Z	Active	High-Z	Active

X = Don't care

\*  $\overline{\text{INVALID}}$  connected to FORCEON

\*\*  $\overline{\text{INVALID}}$  connected to FORCEON and  $\overline{\text{FORCEOFF}}$

outputs that are high impedance when shut down ( $\overline{\text{FORCEOFF}} = \text{GND}$ ) (Table 1).

The MAX3244E/MAX3245E feature an extra, always active, noninverting output, R2OUTB. R2OUTB output monitors receiver activity while the other receivers are high impedance, allowing Ring Indicator applications to be monitored without forward biasing other devices connected to the receiver outputs. This is ideal for systems where VCC is set to ground in shutdown to accommodate peripherals such as UARTs (Figure 2).

The MAX3224E-MAX3227E/MAX3244E/MAX3245E feature an  $\overline{\text{INVALID}}$  output that is enabled low when no valid RS-232 voltage levels have been detected on all receiver inputs. Because  $\overline{\text{INVALID}}$  indicates the receiver

input's condition, it is independent of FORCEON and  $\overline{\text{FORCEOFF}}$  states (Figures 3 and 4).

### AutoShutdown Plus Mode

The MAX3224E-MAX3227E/MAX3244E/MAX3245E achieve a 1μA supply current with Maxim's AutoShutdown Plus feature, which operates when  $\overline{\text{FORCEOFF}}$  is high and a FORCEON is low. When these devices do not sense a valid signal transition on any receiver and transmitter input for 30sec, the on-board charge pumps are shut down, reducing supply current to 1μA. This occurs if the RS-232 cable is disconnected or if the connected peripheral transmitters are turned off, and the UART driving the transmitter inputs is inactive. The system turns on again when a valid transition is applied to any RS-232 receiver or transmitter input. As a result, the sys-

# ±15kV ESD-Protected, 1µA, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

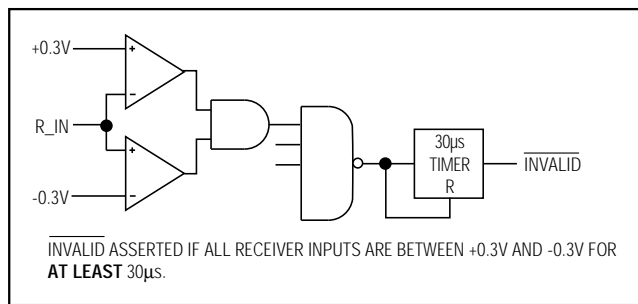

Figure 3a.  $\overline{\text{INVALID}}$  Functional Diagram,  $\overline{\text{INVALID}}$  Low

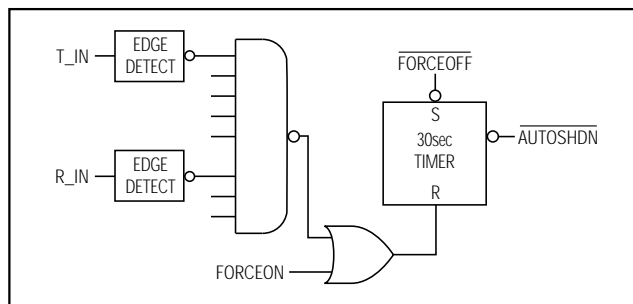

Figure 3c. AutoShutdown Plus Logic

Figure 3b.  $\overline{\text{INVALID}}$  Functional Diagram,  $\overline{\text{INVALID}}$  High

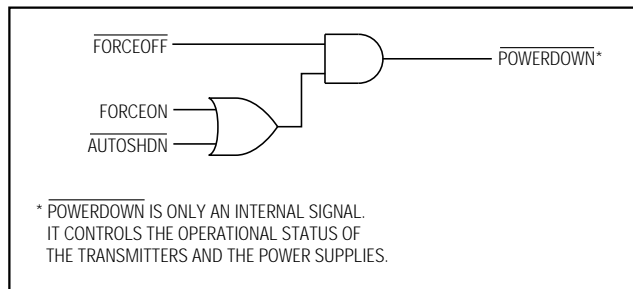

Figure 3d. Power-Down Logic

**Table 2.  $\overline{\text{INVALID}}$  Truth Table**

RS-232 SIGNAL PRESENT AT ANY RECEIVER INPUT	$\overline{\text{INVALID}}$ OUTPUT
Yes	High
No	Low

tem saves power without changes to the existing BIOS or operating system.

Figures 3a and 3b depict valid and invalid RS-232 receiver voltage levels.  $\overline{\text{INVALID}}$  indicates the receiver input's condition, and is independent of FORCEON and FORCEOFF states. Figure 3 and Tables 1 and 2 summarize the operating modes of the MAX3224E-MAX3227E/MAX3244E/MAX3245E. FORCEON and FORCEOFF override AutoShutdown Plus circuitry. When neither control is asserted, the IC selects between these states automatically based on the last receiver or transmitter input edge received.

When shut down, the device's charge pumps turn off, V+ is pulled to VCC, V- is pulled to ground, the transmitter outputs are high impedance, and READY

(MAX3224E-MAX3227E) is driven low. The time required to exit shutdown is typically 100µs (Figure 8).

By connecting FORCEON to  $\overline{\text{INVALID}}$ , the MAX3224E-MAX3227E/MAX3244E/MAX3245E shut down when no valid receiver level and no receiver or transmitter edge is detected for 30sec, and wake up when a valid receiver level or receiver or transmitter edge is detected.

By connecting FORCEON and FORCEOFF to  $\overline{\text{INVALID}}$ , the MAX3224E-MAX3227E/MAX3244E/MAX3245E shut down when no valid receiver level is detected and

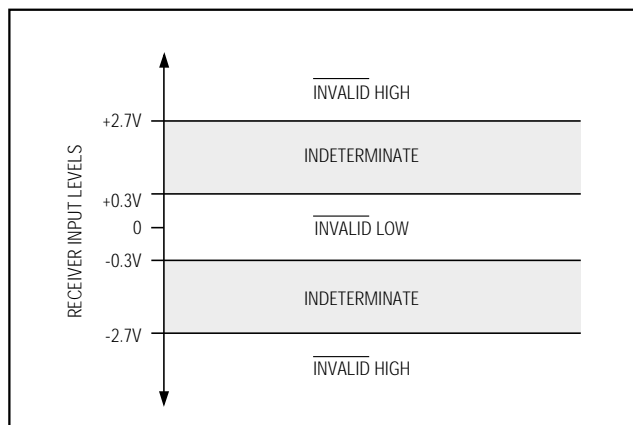

Figure 4a. Receiver Positive/Negative Thresholds for  $\overline{\text{INVALID}}$

# ±15kV ESD-Protected, 1µA, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

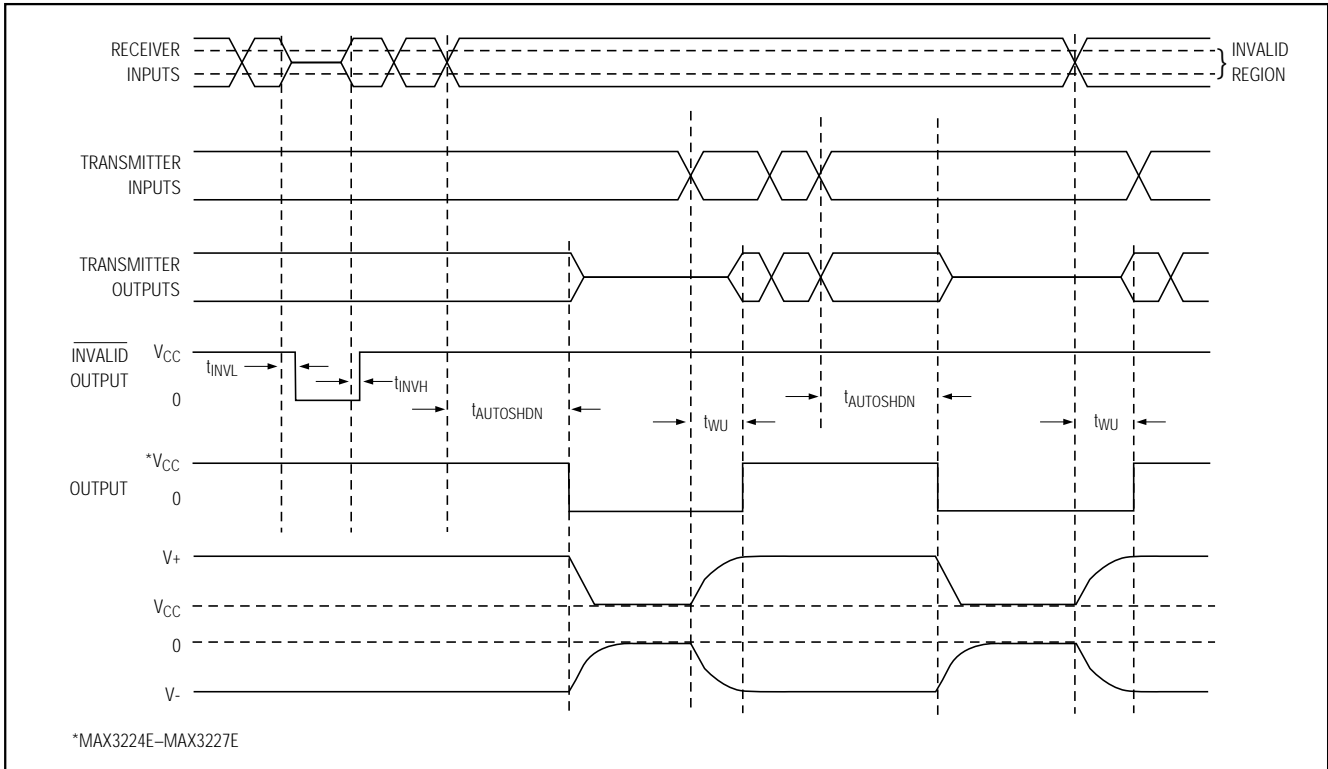

Figure 4b. AutoShutdown Plus,  $\overline{\text{INVALID}}$ , and READY Timing Diagram

wake up when a valid receiver level is detected (same functionality as AutoShutdown feature on MAX3221E/MAX3223E/MAX3243E).

A mouse or other system with AutoShutdown Plus may need time to wake up. Figure 5 shows a circuit that forces the transmitters on for 100ms, allowing enough time for the other system to realize that the MAX3244E/MAX3245E is awake. If the other system outputs valid RS-232 signal transitions within that time, the RS-232 ports on both systems remain enabled.

### Software-Controlled Shutdown

If direct software control is desired, use  $\overline{\text{INVALID}}$  to indicate DTR or Ring Indicator signal. Tie FORCEOFF and FORCEON together to bypass the AutoShutdown Plus so the line acts like a SHDN input.

### ±15kV ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The driver outputs and receiver inputs of the MAX3224E-MAX3227E/MAX3244E/MAX3245E have extra protection against static electricity. Maxim's engineers

have developed state-of-the-art structures to protect these pins against ESD of ±15kV without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, Maxim's E versions keep working without latchup, whereas competing RS-232 products can latch and must be powered down to remove latchup.

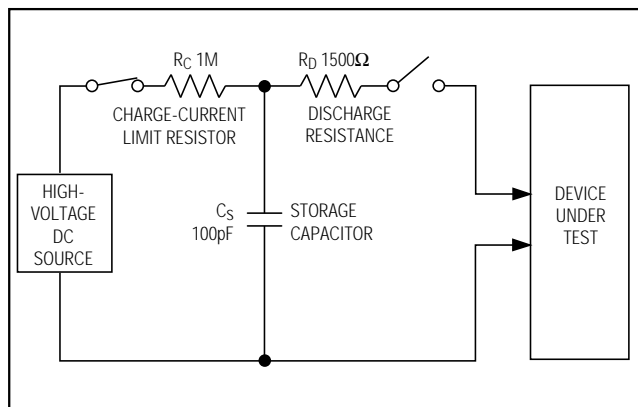

Figure 6a. Human Body ESD Test Model

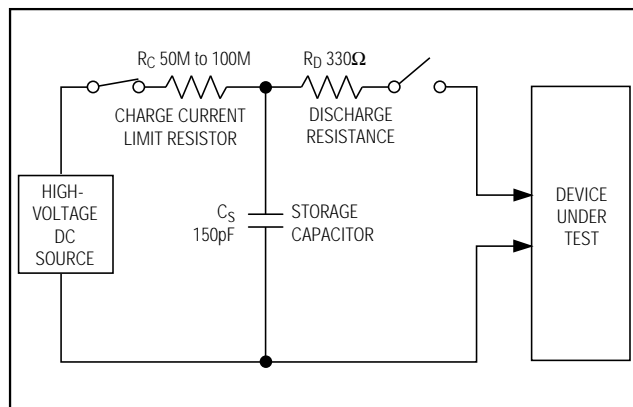

Figure 7a. IEC1000-4-2 ESD Test Model

Figure 6b. Human Body Current Waveform

Figure 7b. IEC1000-4-2 ESD Generator Current Waveform

ESD protection can be tested in various ways; the transmitter outputs and receiver inputs of this product family are characterized for protection to the following limits:

- 1) ±15kV using the Human Body Model
- 2) ±8kV using the contact-discharge method specified in IEC1000-4-2
- 3) ±15kV using IEC1000-4-2's air-gap method.

### ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

### Human Body Model

Figure 6a shows the Human Body Model and Figure 6b shows the current waveform it generates when discharged into a low impedance. This model consists of

a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

### IEC1000-4-2

The IEC1000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to integrated circuits. The MAX3224E-MAX3227E, MAX3244E/MAX3245E help you design equipment that meets Level 4 (the highest level) of IEC1000-4-2, without the need for additional ESD-protection components.

The major difference between tests done using the Human Body Model and IEC1000-4-2 is higher peak current in IEC1000-4-2, because series resistance is

## ±15kV ESD-Protected, 1µA, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

lower in the IEC1000-4-2 model. Hence, the ESD withstand voltage measured to IEC1000-4-2 is generally lower than that measured using the Human Body Model. Figure 7a shows the IEC1000-4-2 model and Figure 7b shows the current waveform for the 8kV, IEC1000-4-2, Level 4, ESD contact-discharge test.

The air-gap test involves approaching the device with a charged probe. The contact-discharge method connects the probe to the device before the probe is energized.

### Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during manufacturing. Of course, all pins require this protection during manufacturing, not just RS-232 inputs and outputs. Therefore, after PC board assembly, the Machine Model is less relevant to I/O ports.

## Applications Information

### Capacitor Selection

The capacitor type used for C1–C4 is not critical for proper operation; polarized or nonpolarized capacitors can be used. The charge pump requires 0.1µF capacitors for 3.3V operation. For other supply voltages, see Table 3 for required capacitor values. Do not use values smaller than those listed in Table 3. Increasing the capacitor values (e.g., by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C2, C3, and C4 can be increased without changing C1's value. **However, do not increase C1 without also increasing the values of C2, C3, C4, and CBYPASS, to maintain the proper ratios (C1 to the other capacitors).**

**Table 3. Required Minimum Capacitance Values**

V <sub>CC</sub> (V)	C1, C <sub>BYPASS</sub> (µF)	C2, C3, C4 (µF)
3.0 to 3.6	0.22	0.22
3.15 to 3.6	0.1	0.1
4.5 to 5.5	0.047	0.33
3.0 to 5.5	0.22	1

Figure 8. Transmitter Outputs when Exiting Shutdown or Powering Up

When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR), which usually rises at low temperatures, influences the amount of ripple on V<sub>+</sub> and V<sub>-</sub>.

### Power-Supply Decoupling

In most circumstances, a 0.1µF V<sub>CC</sub> bypass capacitor is adequate. In applications that are sensitive to power-supply noise, use a capacitor of the same value as charge-pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

### Transmitter Outputs when Exiting Shutdown

Figure 8 shows two transmitter outputs when exiting shutdown mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 levels (one transmitter input is high, the other is low). Each transmitter is loaded with 3kΩ in parallel with 1000pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that the transmitters are enabled only when the magnitude of V<sub>-</sub> exceeds approximately -3V.

# ±15kV ESD-Protected, 1µA, 1Mbps, 3.0V to 5.5V, RS-232 Transceivers with AutoShutdown Plus

## High Data Rates

The MAX3224E/MAX3226E/MAX3244E maintain the RS-232 ±5.0V minimum transmitter output voltage even at high data rates. Figure 9 shows a transmitter loopback test circuit. Figure 10 shows a loopback test result at 120kbps, and Figure 11 shows the same test at 250kbps. For Figure 10, all transmitters were driven simultaneously at 120kbps into RS-232 loads in parallel with 1000pF. For Figure 11, a single transmitter was driven at 250kbps, and all transmitters were loaded with an RS-232 receiver in parallel with 250pF.

The MAX3225E/MAX3227E/MAX3245E maintain the RS-232 ±5.0V minimum transmitter output voltage at data rates up to 1Mbps (MegaBaud). Figure 12 shows a loopback test result with a single transmitter driven at 1Mbps and all transmitters loaded with an RS-232 receiver in parallel with 250pF.

## Mouse Driveability

The MAX3244E/MAX3245E are specifically designed to power serial mice while operating from low-voltage power supplies. They have been tested with leading mouse brands from manufacturers such as Microsoft and Logitech. The MAX3244E/MAX3245E successfully drove all serial mice tested and met their respective current and voltage requirements. The MAX3244E/

MAX3245E dual charge pump ensures the transmitters will supply at least ±5V during worst-case conditions. Figure 13b shows the transmitter output voltages under increasing load current. Figure 13a shows a typical mouse connection.

### Interconnection with 3V and 5V Logic

The MAX3224E-MAX3227E/MAX3244E/MAX3245E can directly interface with various 5V logic families, including ACT and HCT CMOS. See Table 4 for more information on possible combinations of interconnections.

Table 5 lists other Maxim ESD-powered transceivers.

**Table 4. Logic Family Compatibility with Various Supply Voltages**

SYSTEM POWER-SUPPLY VOLTAGE (V)	V <sub>CC</sub> SUPPLY VOLTAGE (V)	COMPATIBILITY
3.3	3.3	Compatible with all CMOS families
5	5	Compatible with all TTL and CMOS families
5	3.3	Compatible with ACT and HCT CMOS, and with AC, HC, or CD4000 CMOS
