## Version History

| Specification Revision History |   |
|--------------------------------|---|
| Version                        | Content   |
| EM78P569                       |   |
| 3.7                            | Modify Multiplier function  |
| 3.8                            | 1. Move DARES bit from bit7 to bit3.<br>2. Change instruction "MUL" → "INT A"   |
| 3.9                            | 1. Update Application Note<br>2. Add 17.91MHz main CLK  |
| 4.0                            | 1. Add data RAM address auto-increase function<br>2. Add mclk/2 signal output. (output shared with PC0)<br>3. Add carry bit calculation function.(ADD, SUB) |
| 4.1                            | Modify the relative between VERSEL (code option) and PLUS (RA page2)  |
| 4.2                            | Modify code option define.  |
| 4.3                            | Add the OSC stable and reset timing diagram   |
| 4.4                            | Remove IDLE mode<br>Modify operating temperature  |

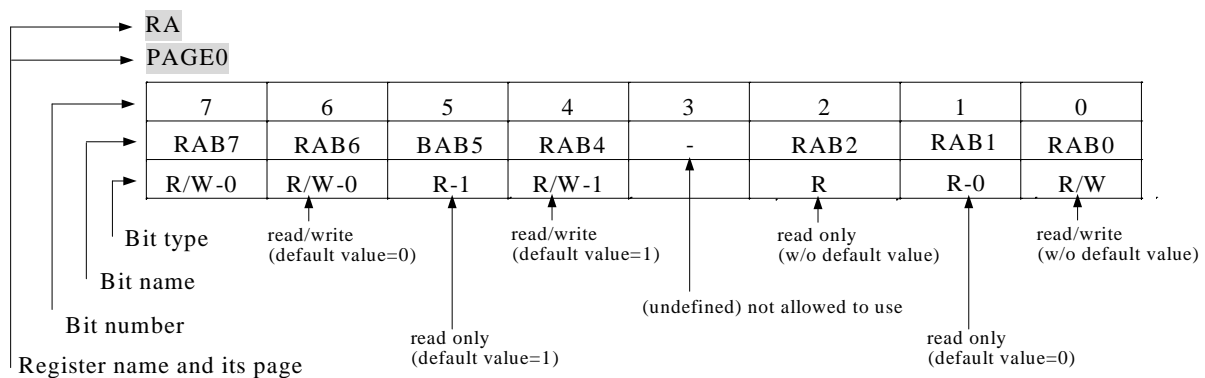

---

## User Application Note

(Before using this chip, take a look at the following description note, it includes important messages.)

1. There are some undefined bits in the registers. The values in these bits are unpredicted. These bits are not allowed to use. We use the symbol “-” in the spec to recognize them.
2. You will see some names for the register bits definitions. Some name will be appear very frequently in the whole spec. The following describes the meaning for the register’s definitions such as bit type, bit name, bit number and so on.

3. Always set IOCC PAGE1 bit 1 = 1 otherwise partial ADC function cannot be used.
4. For 8 bits resolution DAC, DAO pin will output corresponding voltage after write new data to DAC data buffer(RA PAGE1). For 10 bits resolution, DAO pin will output constant after change DAC most significant 2 bits (R5 PAGE1 bit6~7). DAO will output correct voltage after write data to least significant 8 bits. That is to say, **when using 10 bits resolution DAC, user must write most significant 2 bits and least significant 8 bits in order.**
5. Base on “VERSEL”(code option) equal 0 or 1, R8 page1 and RB page2’s define are different.
  - “VERSEL” = 0: R8 page1 defined to data RAM address buffer  
 RB page2 defined to multiplier’s Y data or Y address buffer (controlled by RA page2 bit5 “INDR”).  
 RA page2 bit4(PLUS) determine RAM address auto increase or not (only for multiplier’s addressing).  
 RA page2 bit7 is undefined.
  - “VERSEL” = 1: R8 page1 is undefined.  
 RA page2 bit4(PLUS) determine RAM address auto increase or not (for data RAM and multiplier’s addressing).  
 RA page2 bit7(INS) determine .  
 RB page2 defined to multiplier’s Y data, Y address or data RAM address buffer.
6. The carry bit’s initial value is un-know, please define the initial value before execute first ADD or SUB instruction that include carry bit.(VERSEL =1 and INS = 1)
7. In EM78569’s developing tool, “VERSEL” and “PHO” are at RD page2 bit6 and bit5, but in mask chip, these two bits will mapping to code option. Please set these two bits to fixed value at initial and do not change these two bit among your program.

The differences between ICE569, EM78P569 and EM78569.

## I. General Description

The EM78P569 is an 8-bit RISC type microprocessor with low power, high speed CMOS technology. There are 16Kx13 bits Electrical One Time Programmable Read Only Memory (OTP-ROM) within it. It provides security bits and some One time programmable Option bits to protect the OTP memory code from any external access as well as to meet user's options.

This integrated single chip has an on\_chip watchdog timer (WDT), program OTP-ROM, data RAM, LCD driver, programmable real time clock/counter, internal interrupt, power down mode, built-in three-wire SPI, dual PWM(Pulse Width Modulation), 6-channel 10-bit A/D converter, 10-bit D/A converter and tri-state I/O.

## II. Feature

### CPU

Operating voltage : 2.2V~5.5V at main CLK less then 3.58MHz.

|                        |             |       |        |       |       |
|------------------------|-------------|-------|--------|-------|-------|
| Main CLK(Hz)           | Under 3.58M | 7.16M | 10.74M | 14.4M | 17.9M |
| Operating Voltage(min) | 2.2         | 2.5   | 3      | 3.6   | 4V    |

16k x 13 on chip Electrical One Time Programmable Read Only Memory (OTP-ROM)

1k x 8 on chip data RAM

Up to 51 bi-directional tri-state I/O ports

16 level stack for subroutine nesting

8-bit real time clock/counter (TCC)

two 8-bit counters : COUNTER1 and COUNTER2

On-chip watchdog timer (WDT)

99.9% single instruction cycle commands

8 level Normal mode frequency : 447.8K , 895.7K , 1.79M , 3.58M , 7.16M , 10.75M , 14.3M and 17.9M Hz.

| Mode        | CPU status | Main clock | 32.768kHz clock status |
|-------------|------------|------------|------------------------|
| Sleep mode  | Turn off   | Turn off   | Turn off               |
| Green mode  | Turn on    | Turn off   | Turn on                |
| Normal mode | Turn on    | Turn on    | Turn on                |

Input port interrupt function

12 interrupt source, 4 external, 8 internal

Dual clocks operation (Internal PLL main clock , External 32.768KHz)

8x8 accumulated multiplication-addition multiplier with sign and address auto-increment function

### SPI

Serial Peripheral Interface (SPI) : a kind of serial I/O interface

Interrupt flag available for the read buffer full,

Programmable baud rates of communication

Three-wire synchronous communication. (shared with IO)

### PWM

Dual PWM (Pulse Width Modulation) with 10-bit resolution

Programmable period (or baud rate)

Programmable duty cycle

### ADC

Operating : 2.5V ~ 5.5V

6-channel 10-bit successive approximation A/D converter

Internal (VDD) or external reference

### DAC

Operating : 2.5V ~ 5.5V under VDD reference, 2.8V ~ 5.5V under 2.5V reference

10-bit R-2R D/A converter

Internal (VDD or 2.5V) reference

### POR

2.0V Power-on reset

#### LCD

Common driver pins : 4  
Segment driver pins : 32  
1/3 bias  
1/4 duty, 1/2 duty  
16 Level LCD contrast control by software

#### Multiplier

8 x 8 multiplier

#### PACKAGE

100-pin QFP  
73-pin die

### III. Application

Communication or general product.

| OTP PIN NAME | MASK ROM PIN NAME | P.S. |
|--------------|-------------------|------|
| VDD          | AVDD              |      |
| VPP          | /RESET            |      |
| DINCK        | P65               |      |
| ACLK         | P64               |      |
| PGMB         | P63               |      |
| OEB          | P62               |      |
| DATA         | P73               |      |
| GND          | AVSS              |      |

## VI. Pin Descriptions

| PIN               | I/O             | DESCRIPTION   |
|-------------------|-----------------|---|
| <b>POWER</b>      |                 |   |
| VDD<br>AVDD       | POWER           | Power   |
| VSS<br>AVSS       | POWER           | Ground  |
| <b>CLOCK</b>      |                 |   |
| XIN               | I               | Input pin for 32.768 kHz oscillator   |
| XOUT              | O               | Output pin for 32.768 kHz oscillator  |
| PLLC              | I               | Phase loop lock capacitor, connect a capacitor 0.01u to 0.047u to the ground. |
| <b>LCD</b>        |                 |   |
| COM0 ~ COM3       | O               | Common driver pins of LCD drivers   |
| SEG0 ~ SEG9       | O               | Segment driver pins of LCD drivers  |
| SEG10 ~ SEG12     | O (I/O : PORT5) | SEG10 to SEG31 are shared with IO PORT.                                       |
| SEG13 ~ SEG20     | O (I/O : PORT9) |   |
| SEG21 ~ SEG28     | O (I/O : PORTB) |   |
| SEG29 ~ SEG31     | O (I/O : PORTC) |   |
| <b>10-bit A/D</b> |                 |   |
| AD1               | I (P60)         | ADC input channel 1. Shared with PORT60                                       |
| AD2               | I (P61)         | ADC input channel 2. Shared with PORT61                                       |
| AD3               | I (P62)         | ADC input channel 3. Shared with PORT62                                       |
| AD4               | I (P63)         | ADC input channel 4. Shared with PORT63                                       |
| AD5               | I (P64)         | ADC input channel 1. Shared with PORT64                                       |
| AD6               | I (P65)         | ADC input channel 2. Shared with PORT65                                       |
| VREF              | I (P66)         | ADC external reference input. Shared with PORT66                              |

## VII.2 Operational Register Detail Description

### R0 (Indirect Addressing Register)

R0 is not a physically implemented register. It is used as indirect addressing pointer. Any instruction using R0 as register actually accesses data pointed by the RAM Select Register (R4).

Example:

```
Mov  A, @0x20      ;store a address at R4 for indirect addressing
Mov  0x04, A
Mov  A, @0xAA      ;write data 0xAA to R20 at bank0 through R0
Mov  0x00, A
```

### R1 (TCC)

TCC data buffer. Increased by 16.384KHz or by the instruction cycle clock (controlled by CONT register).  
Written and read by the program as any other register.

### R2 (Program Counter)

The structure is depicted in Fig.3.

Generates  $16k \times 13$  on-chip PROGRAM OTP-ROM addresses to the relative programming instruction codes.

"JMP" instruction allows the direct loading of the low 10 program counter bits.

"CALL" instruction loads the low 10 bits of the PC, PC+1, and then push into the stack.

"RET" ("RETL k", "RETI") instruction loads the program counter with the contents at the top of stack.

"MOV R2, A" allows the loading of an address from the A register to the PC, and the ninth and tenth bits are cleared to "0".

"ADD R2,A" allows a relative address be added to the current PC, and contents of the ninth and tenth bits are cleared to "0".

"TBL" allows a relative address added to the current PC, and contents of the ninth and tenth bits don't change. The most significant bit (A10~A13) will be loaded with the contents of bit PS0~PS3 in the status register (R5 PAGE0) upon the execution of a "JMP", "CALL", "ADD R2, A", or "MOV R2, A" instruction.

If an interrupt is triggered, PROGRAM ROM will jump to address 0x08 at page0. The CPU will store ACC, R3 status and R5 PAGE automatically, and they will be restored after instruction RETI.

Fig.3 Program counter organization

### R3 (Status, Page selection)

(Status flag, Page selection bits)

|        |        |         |   |   |     |     |     |
|--------|--------|---------|---|---|-----|-----|-----|
| 7      | 6      | 5       | 4 | 3 | 2   | 1   | 0   |
| RPAGE1 | RPAGE0 | IOCPAGE | T | P | Z   | DC  | C   |
| R/W-0  | R/W-0  | R/W-0   | R | R | R/W | R/W | R/W |

Bit 0(C) : Carry flag

Bit 1(DC) : Auxiliary carry flag

Bit 2(Z) : Zero flag

Bit 3(P) : Power down bit

Set to 1 during power on or by a "WDTC" command and reset to 0 by a "SLEP" command.

Bit 4(T) : Time-out bit

Set to 1 by the "SLEP" and "WDTC" command, or during power up and reset to 0 by WDT timeout.

| EVENT                         | T | P | REMARK         |
|-------------------------------|---|---|----------------|
| WDT wake up from sleep mode   | 0 | 0 |                |
| WDT time out (not sleep mode) | 0 | 1 |                |
| /RESET wake up from sleep     | 1 | 0 |                |
| Power up                      | 1 | 1 |                |
| Low pulse on /RESET           | x | X | x : don't care |

Bit 5(IOCPAGE) : change IOC5 ~ IOCE to another page

0/1 → IOC page0 / IOC page1

Please refer to VII.1 Operational registers for detail IOC PAGE register configuration.

Bit 6 ~ Bit 7 (RPAGE0 ~ RPAGE1) : change R5 ~ RE to another page

| (RPAGE1,RPAGE0) | R page # selected |
|-----------------|-------------------|
| (0,0)           | R page 0          |
| (0,1)           | R page 1          |
| (1,0)           | R page 2          |
| (1,1)           | R page 3          |

Please refer to VII.1 Operational registers for detail R PAGE register configuration.

**R4 (RAM selection for common registers R20 ~ R3F))**

(RAM selection register)

|       |       |      |      |      |      |      |      |
|-------|-------|------|------|------|------|------|------|
| 7     | 6     | 5    | 4    | 3    | 2    | 1    | 0    |
| RB1   | RB0   | RSR5 | RSR4 | RSR3 | RSR2 | RSR1 | RSR0 |
| R/W-0 | R/W-0 | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  |

Bit 0 ~ Bit 5 (RSR0 ~ RSR5) : Indirect addressing for common registers R20 ~ R3F

RSR bits are used to select up to 32 registers (R20 to R3F) in the indirect addressing mode.

Bit 6 ~ Bit 7 (RB0 ~ RB1) : Bank selection bits for common registers R20 ~ R3F

These selection bits are used to determine which bank is activated among the 4 banks for 32 register (R20 to R3F)..

Please refer to VII.1 Operational registers for details.

**R5 (PORT5 I/O data, Program page selection, LCD address, SPI control, PWM control)**

PAGE0 (PORT5 I/O data register, Program page register)

|     |     |     |   |       |       |       |       |
|-----|-----|-----|---|-------|-------|-------|-------|
| 7   | 6   | 5   | 4 | 3     | 2     | 1     | 0     |
| P57 | P56 | P55 | - | PS3   | PS2   | PS1   | PS0   |
| R/W | R/W | R/W |   | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

Bit 0 ~ Bit 3 (PS0 ~ PS3) : Program page selection bits

| PS3 | PS2 | PS1 | PS0 | Program memory page (Address) |
|-----|-----|-----|-----|-------------------------------|
| 0   | 0   | 0   | 0   | Page 0                        |
| 0   | 0   | 0   | 1   | Page 1                        |
| 0   | 0   | 1   | 0   | Page 2                        |
| 0   | 0   | 1   | 1   | Page 3                        |
| :   | :   | :   | :   | :                             |
| :   | :   | :   | :   | :                             |
| 1   | 1   | 1   | 0   | Page 14                       |
| 1   | 1   | 1   | 1   | Page 15                       |

User can use PAGE instruction to change page to maintain program page by user.

Bit 4 : (undefined) not allowed to use

Bit 5 ~ Bit 7 (P55 ~ P57) : 8-bit PORT5(5~7) I/O data register

User can use IOC register to define input or output each bit.

PAGE1 (LCD address)

|     |     |   |   |       |       |       |       |
|-----|-----|---|---|-------|-------|-------|-------|
| 7   | 6   | 5 | 4 | 3     | 2     | 1     | 0     |
| DA9 | DA8 | - | - | LCDA3 | LCDA2 | LCDA1 | LCDA0 |
| R/W | R/W |   |   | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

Bit 0 ~ Bit 3 (LCDA0 ~ LCDA3) : LCD address for LCD RAM read or write

The address of the LCD RAM correspond to the COMMON and SEGMENT signals as the table.

| COM3 ~ COM0  | LCD address (LCDA3 ~ LCDA0) |
|--------------|-----------------------------|
| SEG1, SEG0   | 00H                         |
| SEG3, SEG2   | 01H                         |
| SEG5, SEG4   | 02H                         |
| SEG7, SEG6   | 03H                         |
| SEG9, SEG8   | 04H                         |
| SEG11, SEG10 | 05H                         |
| SEG13, SEG12 | 06H                         |
| SEG15, SEG14 | 07H                         |
| SEG17, SEG16 | 08H                         |
| SEG19, SEG18 | 09H                         |

\* This specification is subject to be changed without notice.

|              |     |
|--------------|-----|
| SEG21, SEG20 | 0AH |
| SEG23, SEG22 | 0BH |
| SEG25, SEG24 | 0CH |
| SEG27, SEG26 | 0DH |
| SEG29, SEG28 | 0EH |
| SEG31, SEG30 | 0FH |

Bit 4 ~ Bit 5 : Unused

**Bit 6 ~ Bit 7(DA8~DA9) : DA8 and DA9 are DAC MSB when R7 page1 bit 3(DARES) is set ,or unused when DAREF clear to 0. When using 10 bits resolution DAC, DAO output voltage will unchanged after write data to these two bits. DAO pin will change after write new data to DAC low 8 bits data buffer (RA PAGE1).**

**PAGE2 (SPI control)**

|       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| RBF   | SPIE  | SRO   | SE    | SCES  | SBR2  | SBR1  | SBR0  |
| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

Fig.4 Single SPI Master / Salve Communication

Fig. 4 shows how SPI to communicate with other device by SPI module. If SPI is a master controller, it sends clock through the SCK pin. An 8-bit data is transmitted and received at the same time. If SPI, however, is defined as a slave, its SCK pin could be programmed as an input pin. Data will continue to be shifted on a basis of both the clock rate and the selected edge.

Bit 0 ~ Bit 2 (SBR0 ~ SBR2) : SPI baud rate selection bits

| SBR2 | SBR1 | SBR0 | Mode   | Baud rate |
|------|------|------|--------|-----------|
| 0    | 0    | 0    | Master | Fsco      |
| 0    | 0    | 1    | Master | Fsco/2    |
| 0    | 1    | 0    | Master | Fsco/4    |
| 0    | 1    | 1    | Master | Fsco/8    |
| 1    | 0    | 0    | Master | Fsco/16   |
| 1    | 0    | 1    | Master | Fsco/32   |
| 1    | 1    | 0    | Slave  |           |
| 1    | 1    | 1    | Master | 16.384k   |

<Note> Fsco = CPU instruction clock

For example :

If PLL is enabled and main clock is selected to 3.5826MHz, the instruction clock is 3.5826MHz/2

→ Fsco=3.5862MHz/2

---

If PLL is enabled and main clock is selected to 3.5826MHz, the instruction clock is 0.895MHz/2

→  $F_{sco}=0.895\text{MHz}/2$

If PLL is disabled, the instruction clock is 32.768kHz/2 →  $F_{sco}=32.768\text{kHz}/2$ .

Bit 3 (SCES) : SPI clock edge selection bit

1 → Data shifts out on falling edge, and shifts in on rising edge. Data is hold during the high level.

0 → Data shifts out on rising edge, and shifts in on falling edge. Data is hold during the low level.

Bit 4 (SE) : SPI shift enable bit

1 → Start to shift, and keep on 1 while the current byte is still being transmitted.

0 → Reset as soon as the shifting is complete, and the next byte is ready to shift.

<Note> This bit has to be reset in software.

Bit 5 (SRO) : SPI read overflow bit

1 → A new data is received while the previous data is still being hold in the SPIB register. In this situation, the data in SPIB register will be destroyed. To avoid setting this bit, users had better to read SPIB register even if the transmission is implemented only.

0 → No overflow, <Note> This can only occur in slave mode.

Bit 6 (SPIE) : SPI enable bit

1 → Enable SPI mode

0 → Disable SPI mode

Bit 7 (RBF) : SPI read buffer full flag

1 → Receive is finished, SPIB is full.

0 → Receive is not finish yet, SPIB is empty.

Fig.5 SPI structure

SPIC reg. : SPI control register

SDO: Serial data out

SDI: Serial data in

SCK: Serial clock

RBF : Set by buffer full detector, and reset in software.

RBFI : Interrupt flag. Set by buffer full detector, and reset in software.

Buffer Full Detector : Sets to 1, while an 8-bit shifting is complete.

SE : Loads the data in SPIW register, and begin to shift

SPIE : SPI control register

SPIS reg. : Shifting byte out and in.

The MSB will be shifted first. Both the SPIS register and the SPIW register are loaded at the same time. Once data being written to, SPIS starts transmission / reception. The received data will be moved to the SPIR register, as the shifting of the 8-bit data is complete. The RBF (Read Buffer Full ) flag and the RBFI(Read Buffer Full Interrupt) flag are set.

SPIR reg. : Read buffer.

The buffer will be updated as the 8-bit shifting is complete. The data must be read before the next reception is finished. The RBF flag is cleared as the SPIR register read.

SPIW reg. : Write buffer.

The buffer will deny any write until the 8-bit shifting is complete. The SE bit will be kept in 1 if the communication is still under going. This flag must be cleared as the shifting is finished. Users can determine if the next write attempt is available.

SBR2 ~ SBR0: Programming the clock frequency/rates and sources.

Clock select : Selecting either the internal instruction clock or the external 16.338KHz clock as the shifting clock.

Edge Select : Selecting the appropriate clock edges by programming the SCES bit

Fig.6 SPI timing

PAGE3 (PWMCON)

|       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| PWM2E | PWM1E | T2EN  | T1EN  | T2P1  | T2P0  | T1P1  | T1P0  |
| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

Bit 0 ~ Bit 1 ( T1P0 ~ T1P1 ): TMR1 clock prescale option bits.

| T1P1 | T1P0 | Prescale     |
|------|------|--------------|
| 0    | 0    | 1:2(Default) |
| 0    | 1    | 1:8          |
| 1    | 0    | 1:32         |
| 1    | 1    | 1:64         |

Bit 2 ~ Bit 3 ( T2P0 ~ T2P1 ): TMR2 clock prescale option bits.

| T2P1 | T2P0 | Prescale     |
|------|------|--------------|
| 0    | 0    | 1:2(Default) |
| 0    | 1    | 1:8          |
| 1    | 0    | 1:32         |
| 1    | 1    | 1:64         |

Bit 4 (T1EN): TMR1 enable bit

0 → TMR1 is off (default value).

1 → TMR1 is on.

Bit 5 (T2EN): TMR2 enable bit

0 → TMR2 is off (default value).

1 → TMR2 is on.

Bit 6 (PWM1E): PWM1 enable bit

0 → PWM1 is off (default value), and its related pin carries out the PC1 function;

1 → PWM1 is on, and its related pin will be set to output automatically.

Bit 7 (PWM2E): PWM2 enable bit

0 → PWM2 is off (default value), and its related pin carries out the PC2 function.

1 → PWM2 is on, and its related pin will be set to output automatically.

#### R6 (PORT6 I/O data, LCD data, SPI data buffer, PWM1 duty)

##### PAGE0 (PORT6 I/O data register)

| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

|         |         |         |         |         |         |         |         |
|---------|---------|---------|---------|---------|---------|---------|---------|
| 7       | 6       | 5       | 4       | 3       | 2       | 1       | 0       |
| PWM1[7] | PWM1[6] | PWM1[5] | PWM1[4] | PWM1[3] | PWM1[2] | PWM1[1] | PWM1[0] |
| R/W-0   | R/W-0   | R/W-0   | R/W-0   | R/W-0   | R/W-0   | R/W-0   | R/W-0   |

A specified value keeps the output of PWM1 to stay at high until the value matches with TMR1.

**R7 (PORT7 I/O data, Data RAM bank, PWM1 duty, ADC output and resolution)**

**PAGE0 (PORT7 I/O data register)**

|     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| P77 | P76 | P75 | P74 | P73 | P72 | P71 | P70 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Bit 0 ~ Bit 7 (P70 ~ P77) : 8-bit PORT7(0~7) I/O data register

User can use IOC register to define input or output each bit.

**PAGE1 (ADC output data(8~9), AD resolution control, Data RAM bank selection bits)**

|   |   |     |     |              |       |        |        |
|---|---|-----|-----|--------------|-------|--------|--------|
| 7 | 6 | 5   | 4   | 3            | 2     | 1      | 0      |
| - | - | AD9 | AD8 | <b>DARES</b> | ADRES | RAM_B1 | RAM_B0 |
|   |   | R   | R   | <b>R/W-0</b> | R/W-0 | R/W-0  | R/W-0  |

Bit 0~Bit 1 (RAM\_B0~RAM\_B1) : Data RAM bank selection bits

Each bank has address 0 ~ address 255 which is total 256 (0.25k) bytes RAM size.

Data RAM bank selection : (Total RAM = 1K)

| RAM_B1 | RAM_B0 | PAGE  |
|--------|--------|-------|
| 0      | 0      | PAGE0 |
| 0      | 1      | PAGE1 |
| 1      | 0      | PAGE2 |
| 1      | 1      | PAGE3 |

Bit 2(ADRES) : Resolution selection for ADC

0 → ADC is 8-bit resolution

When 8-bit resolution is selected, the most significant(MSB) 8-bit data output of the internal 10-bit ADC will be mapping to RB PAGE1 so R7 PAGE1 bit 4 ~5 will be of no use.

1 → ADC is 10-bit resolution

When 10-bit resolution is selected, 10-bit data output of the internal 10-bit ADC will be exactly mapping to RB PAGE1 and R7 PAGE1 bit 4 ~5.

*For program compatible concern : if ADC is used, "please set this bit to 1" because 8-bit ADC resolution mode will not support in the mask version EM78569.*

**Bit 3 : Resolution selection for DAC**

0 → DAC is 8-bit resolution

When 8-bit resolution is selected, the most significant(MSB) 8-bit data output of the internal 10-bit DAC will be mapping to RA PAGE1 so R5 PAGE1 bit 6 ~7 will be of no use.

1 → DAC is 10-bit resolution

When 10-bit resolution is selected, 10-bit data output of the internal 10-bit DAC will be exactly mapping to RA PAGE1 and R5 PAGE1 bit 6 ~7.

\* This specification is subject to be changed without notice.

Bit 4 ~ Bit 5(AD8 ~ AD9) : The most significant 2 bit of 10-bit ADC conversion output data  
Combine there two bits and RB PAGE1 as complete 10-bit ADC conversion output data.

Bit6 ~Bit7 : (undefined) not allowed to use

PAGE2 : (undefined) not allowed to use

PAGE3 (DT1H: the Most Significant Byte ( Bit 1 ~ Bit 0 ) of Duty Cycle of PWM1)

|   |   |   |   |   |   |         |         |

| R/W-0 | R/W-0 | R/W-0 | R/W-1 | R/W-1 |   |   | R/W-0 |

Bit 0(WDTEN) : Watch dog control bit

0/1 → disable/enable

User can use WDTC instruction to clear watch dog counter. The counter 's clock source is 32768/2 Hz. If the prescaler assigns to TCC. Watch dog will time out by  $(1/32768) * 2 * 256 = 15.616\text{mS}$ . If the prescaler assigns to WDT, the time of time out will be more times depending on the ratio of prescaler.

Bit 1 ~ Bit 2 : (undefined) not allowed to use

Bit 3 ~ Bit 5 (CLK0 ~ CLK2) : MAIN clock selection bits

User can choose different frequency of main clock by CLK1 and CLK2. All the clock selection is list below.

| PLEN | CLK2       | CLK1       | CLK0       | Sub clock | MAIN clock | CPU clock                |
|------|------------|------------|------------|-----------|------------|--------------------------|
| 1    | 0          | 0          | 0          | 32.768kHz | 447.829kHz | 447.829kHz (Normal mode) |
| 1    | 0          | 0          | 1          | 32.768kHz | 895.658kHz | 895.658kHz (Normal mode) |
| 1    | 0          | 1          | 0          | 32.768kHz | 1.791MHz   | 1.791MHz (Normal mode)   |
| 1    | 0          | 1          | 1          | 32.768kHz | 3.582MHz   | 3.582MHz (Normal mode)   |
| 1    | 1          | 0          | 0          | 32.768kHz | 7.165MHz   | 7.165MHz (Normal mode)   |
| 1    | 1          | 0          | 1          | 32.768kHz | 10.747MHz  | 10.747MHz (Normal mode)  |
| 1    | 1          | 1          | 0          | 32.768kHz | 14.331MHz  | 14.331MHz (Normal mode)  |
| 1    | 1          | 1          | 1          | 32.768kHz | 17.91MHz   | 17.91MHz (Normal mode)   |
| 0    | don't care | don't care | don't care | 32.768kHz | don't care | 32.768kHz (Green mode)   |

Bit 6(PLEN) : PLL's power control bit which is CPU mode control register

0/1 → disable PLL/enable PLL

If enable PLL, CPU will operate at normal mode (high frequency). Otherwise, it will run at green mode (low frequency, 32768 Hz).

Fig.7 The relation between 32.768kHz and PLL

**Bit 7: Unused register. Always keep this bit to 0 or some un-expect error will happen!**

The status after wake-up and the wake-up sources list as the table below.

| Wakeup signal  | SLEEP mode                     |
|--|--------------------------------|
|  | RA(7,6)=(0,0)<br>+ SLEP        |
| TCC time out<br>IOCF bit0=1                                | No function                    |
| COUNTER1 time out<br>IOCF bit1=1                           | No function                    |
| COUNTER2 time out<br>IOCF bit2=2                           | No function                    |
| WDT time out   | Reset and jump to<br>address 0 |
| PORT8(0~3)<br>RE PAGE0 bit3 or<br>bit4 or bit5 or bit6 = 1 | Reset and Jump to<br>address 0 |
| PORT7(0~3)<br>IOCF bit3 or bit4 or<br>bit5 or bit7=1       | Reset and Jump to<br>address 0 |

<Note> PORT70 's wakeup function is controlled by IOCF bit 3. It's falling edge or rising edge trigger (controlled by CONT register bit7).

PORT7(1~3) 's wakeup functions are controlled by IOCF bit (4,5,7). They are falling edge trigger.

PORT80~PORT83' s wakeup function are controlled by RE PAGE0 bit 0 ~ bit 3. They are falling edge trigger.

**PAGE1 (DAC output data register)**

| 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |

| 0 1 0 0 ~ 0 1 1 1 | unused  | -  |

Bit 4 (PLUS) : Base on "VERSEL", this bit's defined is different. If VERSEL = 0, data RAM and multiplicand Y's address buffer is independent. When VERSEL = 1, both data RAM and multiplicand Y's address are point to RB page2.

| VERSEL | PLUS | Data RAM address buffer | Multiplicand Y's address buffer | Effect   |
|--------|------|-------------------------|---------------------------------|--|
| 0      | 0    | R8 page1                | RB page2                        | Data RAM's address will not auto-increase after access, Y's address will not auto-increase after run instruction "INT A" |
| 0      | 1    | R8 page1                | RB page2                        | Data RAM's address will not auto-increase after access, Y's address will auto-increase after run instruction "INT A"     |
| 1      | 0    | RB page2                | RB page2                        | Data RAM's address will auto-increase after access, Y's address will not auto-increase after run instruction "INT A"     |
| 1      | 1    | RB page2                | RB page2                        | Data RAM's address will auto-increase after access, Y's address will auto-increase after run instruction "INT A"         |

Bit 5 (INDR) : Indirect address pointer enable control

0/1 → disable/enable

When (INDR,PLUS) = (1,1), the address pointer and address auto-increment functions are enabled. Under the functions are enabled, RB PAGE1 acts as address pointer and it will automatically increase one after "INT A" instruction execution. That is to say, RB PAGE2 = RB PAGE2 + 1. The multiplicand Y data is stored in R9 PAGE1 data RAM buffer.

| Bit 5 (INDR) | Bit 4 (PLUS) | Function  |
|--------------|--------------|---|
| 1            | 0            | Enable indirect address pointer<br>RB PAGE2 acts as Multiplicand Y data address pointer for multiplier<br>Multiplicand Y data is stored in R9 PAGE1 for multiplier<br>Disable Multiplicand Y data address auto-increment for multiplier |

Bit 0 ~ Bit 7 (AD0 ~ AD7) : These 8 bit is full ADC data buffer when 8-bit resolution is selected(R7 page1 bit 2 ADREF = 0), or the least significant 8-bit data when 10 bit resolution(ADREF = 1) selected..

**PAGE2(Multiplicand Y Data buffer and Data RAM's data buffer)**

Base on "VERSEL", this page's defined is different.

**For VERSEL = 0 :**

|       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| MULY7 | MULY6 | MULY5 | MULY4 | MULY3 | MULY2 | MULY1 | MULY0 |
| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

Bit 0 ~ Bit 7 (MULY0 ~ MULY7) : Multiplicand Y data buffer of multiplier

The multiplier can make a multiplication with X\*Y. The multiplier data buffer X is ACC and the multiplicand data buffer Y is RB PAGE2. The maximum 24 bit multiplication result MR will be stored in RC PAGE2 ~ RE PAGE2. That is to say, MR = X\*Y.

**For VERSEL = 1 :**

At this status, RB page2 defined to multiplicand Y data buffer and Data RAM address buffer.

Example 1 : Read continue data from continuous data RAM address:

```

MOV  A , @0b00111111
AND  0x03 , A
BS   0x03 , 7 ; Set R register to page 2
CLR  0x0B ; Set RAM address = 0
BS   0x0A , 4 ; Enable address auto-increase function
BC   0x03 , 7
BS   0x03 , 6 ; Set R register to page 1
MOV  A , @0b11111100
AND  0x07 , A ; Set RAM bank 0
MOV  A , 0x09 ; read Data RAM address 0x00's data
MOV  A , 0x09 ; read Data RAM address 0x01's data
MOV  A , 0x09 ; read Data RAM address 0x02's data
:
:

```

Example 2 : Continuous multiplication and addition operation.

```

MOV  A , @0b00111111
AND  0x03 , A
BS   0x03 , 7 ; Set R register to page 2
CLR  0x0C
CLR  0x0D
CLR  0x0E ; Clear MR = 0
BS   0x0A , 5 ; enable multiplier's indirect address mode
BS   0x0A , 4 ; Enable address auto-increase function
CLR  0x0B ; Set address = 0
MOV  A , @0x55
INT  A ; multiplication instruction, operate MR ← 0x55(A) x (address 0' data)
INT  A ; MR ← 0x55(A) x (address 1' data) + MR
INT  A ; MR ← 0x55(A) x (address 2' data) + MR
:
:

```

**PAGE3 (PRD2: Period of PWM2)**

|         |         |         |         |         |         |         |         |
|---------|---------|---------|---------|---------|---------|---------|---------|
| 7       | 6       | 5       | 4       | 3       | 2       | 1       | 0       |

| MR7 | MR6 | MR5 | MR4 | MR3 | MR2 | MR1 | MR0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Bit 0 ~ Bit 7 (MR0 ~ MR7) : Multiplication result data

The multiplier can make a multiplication with X\*Y. The multiplier data buffer X is ACC(accumulator) and the multiplicand data buffer Y is RB PAGE2. The LSB 8-bit of maximum 24 bit multiplication result MR will be stored in RC PAGE2.

RC PAGE2 = MR(0~7) = LSB 8-bit (X\*Y)

**PAGE3** : (undefined) not allowed to use

**RD (LCD control, Counter2 data, PWM1,2 duty latch)**

**PAGE0 (LCD driver control bits)**

|   |               |              |       |   |        |        |       |
|---|---------------|--------------|-------|---|--------|--------|-------|
| 7 | 6             | 5            | 4     | 3 | 2      | 1      | 0     |
| - | <b>VERSEL</b> | <b>PHO</b>   | 1     | - | LCD_C1 | LCD_C0 | LCD_M |
|   | <b>R/W-0</b>  | <b>R/W-0</b> | R/W-0 |   | R/W-0  | R/W-0  | R/W-0 |

Bit 0 (LCD\_M) : LCD operation method including duty and frame frequency

Bit 1 ~ Bit 2 (LCD\_C0 ~ LCD\_C1) : LCD display control

| LCD_C1 | LCD_C0 | LCD_M | LCD Display Control   | Duty | Bias |
|--------|--------|-------|-----------------------|------|------|
| 0      | 0      | 0     | change duty           | 1/4  | 1/3  |
|        |        | 1     | Disable(turn off LCD) | 1/2  | 1/3  |
| 0      | 1      | :     | Blanking              | :    | :    |
| 1      | 1      | :     | LCD display enable    | :    | :    |

Ps. To change the display duty must set the "LCD\_C1 ,LCD\_C0" to "00".

The controller can drive LCD directly. The LCD block is made up of common driver, segment driver, display LCD RAM, common output pins, segment output pins and LCD operating power supply. The basic structure contains a timing control. This timing control uses the basic frequency 32.768KHz to generate the proper timing for different duty and display access.

RD PAGE0 Bit 0 ~ Bit 2 are LCD control bits for LCD driver. These LCD control bits determine the duty, the number of common and the frame frequency. The LCD display (disable, enable, blanking) is controlled by Bit 1 and Bit 2. The driving duty is decided by Bit 0. The display data is stored in LCD RAM which address and data access controlled by registers R5 PAGE1 and R6 PAGE1.

User can regulate the contrast of LCD display by IOC5 PAGE0 Bit 0 ~ Bit 3 (BIAS0 ~ BIAS3). Up to 16 levels contrast is convenient for better display.

Bit 3, Bit 7 : (undefined) not allowed to use

**Bit5 and Bit6 are only exist in EM78569's developing tool(ICE569). In OTP and mask chip, these two bits will mapping to code option. Please set these two bits to fixed value at initial and do not change these two bit among your program design. Besides, please set bit4 to 1 or AD function will difference between ICE 569 and EM78P569**

Bit 4: Always set this bit to 1.

Bit 5(PHO) : PC0 status select.

0 → PC0 defined to normal IO.

1 → PC0 defined to phase1 output.(VERSEL must = 1)

Bit 6(VERSEL) : Version select.

|                                   | VERSEL = 0  | VERSEL = 1                                  |

| R/W-0 |   | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

"1" means interrupt request, "0" means non-interrupt

Bit 0(TCIF) : TCC timer overflow interrupt flag

Set when TCC timer overflows.

Bit 1(CNT1) : counter1 timer overflow interrupt flag

Set when counter1 timer overflows.

Bit 2(CNT2) : counter2 timer overflow interrupt flag

Set when counter2 timer overflows.

Bit 3(INT0) : external INT0 pin interrupt flag

If PORT70 has a falling edge/rising edge (controlled by CONT register) trigger signal, CPU will set this bit.

Bit 4(INT1) : external INT1 pin interrupt flag

If PORT71 has a falling edge trigger signal, CPU will set this bit.

Bit 5(INT2) : external INT2 pin interrupt flag

If PORT72 has a falling edge trigger signal, CPU will set this bit.

Bit 6 : (undefined) not allowed to use

Bit 7(INT3) : external INT3 pin interrupt flag

If PORT73 has a falling edge trigger signal, CPU will set this bit.

<Note> IOCF is the interrupt mask register. User can read and clear.

Trigger edge as the table

| Signal   | Trigger                                 |
|----------|---|
| TCC      | Time out                                |
| COUNTER1 | Time out                                |

| DETO     | Falling edge<br>Falling and rising edge |

### R10~R3F (General Purpose Register)

R10~R3F (Banks 0 ~ 3) : all are general purpose registers.

## VII.3 Special Purpose Registers

### A (Accumulator)

Internal data transfer, or instruction operand holding

It's not an addressable register.

### CONT (Control Register)

| 7     | 6   | 5  | 4     | 3   | 2    | 1    | 0    |
|-------|-----|----|-------|-----|------|------|------|
| P70EG | INT | TS | RETBK | PAB | PSR2 | PSR1 | PSR0 |

Bit 0 ~ Bit 2 (PSR0 ~ PSR2) : TCC/WDT prescaler bits

| PSR2 | PSR1 | PSR0 | TCC rate | WDT rate |
|------|------|------|----------|----------|
| 0    | 0    | 0    | 1:2      | 1:1      |
| 0    | 0    | 1    | 1:4      | 1:2      |
| 0    | 1    | 0    | 1:8      | 1:4      |
| 0    | 1    | 1    | 1:16     | 1:8      |
| 1    | 0    | 0    | 1:32     | 1:16     |
| 1    | 0    | 1    | 1:64     | 1:32     |
| 1    | 1    | 0    | 1:128    | 1:64     |
| 1    | 1    | 1    | 1:256    | 1:128    |

Bit 3(PAB) : Prescaler assignment bit

0/1 → TCC/WDT

Bit 4(RETBK) : Return value backup control for interrupt routine

0 → disable/enable

When this bit is set to 1, the CPU will store ACC,R3 status and R5 PAGE automatically after an interrupt is triggered. And it will be restored after instruction RETI. When this bit is set to 0, the user need to store ACC, R3 and R5 PAGE in user program.

Bit 5(TS) : TCC signal source

0 → internal instruction cycle clock

1 → 16.384kHz

Bit 6 (INT) : INT enable flag

0 → interrupt masked by DISI or hardware interrupt

1 → interrupt enabled by ENI/RETI instructions  
 Bit 7(P70EG) : interrupt edge type of P70  
 0 → P70 's interruption source is a rising edge signal.  
 1 → P70 's interruption source is a falling edge signal.  
 CONTR register is readable (CONTR) and writable (CONTW).  
 TCC and WDT :

There is an 8-bit counter available as prescaler for the TCC or WDT. The prescaler is available for the TCC only or WDT only at the same time.

An 8 bit counter is available for TCC or WDT determined by the status of the bit 3 (PAB) of the CONT register.

See the prescaler ratio in CONT register.

Fig.9 depicts the circuit diagram of TCC/WDT.

Both TCC and prescaler will be cleared by instructions which write to TCC each time.

The prescaler will be cleared by the WDTC and SLEP instructions, when assigned to WDT mode.

The prescaler will not be cleared by SLEP instructions, when assigned to TCC mode.

Fig.9 Block diagram of TCC WDT

| IOC67 | IOC66 | IOC65 | IOC64 | IOC63 | IOC62 | IOC61 | IOC60 |
| R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 |

Bit 0 ~ Bit 7 (IOC60 ~ IOC67) : PORT6(0~7) I/O direction control register

0 → put the relative I/O pin as output

1 → put the relative I/O pin into high impedance

#### PAGE1 (P6\* pins switch control register)

|   |       |       |       |       |       |       |       |
|---|-------|-------|-------|-------|-------|-------|-------|
| 7 | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| - | P66S  | P65S  | P64S  | P63S  | P62S  | P61S  | P60S  |
|   | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

“Before using bit 1 ~ Bit 6, please set IOCE PAGE1 bit0(MS) = 1 to enable these port switches function”

Bit 0(P60S) : Select normal I/O PORT60 pin or channel 1 input AD1 pin of ADC

0 → P60 (I/O PORT60) pin is selected

1 → AD1 (Channel 1 input of ADC) pin is selected

Bit 1(P61S) : Select normal I/O PORT61 pin or channel 2 input AD2 pin of ADC

0 → P61 (I/O PORT61) pin is selected

1 → AD2 (Channel 2 input of ADC) pin is selected

Bit 2(P62S) : Select normal I/O PORT62 pin or channel 3 input AD3 pin of ADC

- 0 → P62 (I/O PORT62) pin is selected
- 1 → AD3 (Channel 3 input of ADC) pin is selected

Bit 3(P63S) : Select normal I/O PORT63 pin or channel 4 input AD4 pin of ADC

- 0 → P63 (I/O PORT63) pin is selected
- 1 → AD4 (Channel 4 input of ADC) pin is selected

Bit 4(P64S) : Select normal I/O PORT64 pin or channel 5 input AD5 pin of ADC

- 0 → P64 (I/O PORT64) pin is selected
- 1 → AD5 (Channel 5 input of ADC) pin is selected

Bit 4(P65S) : Select normal I/O PORT65 pin or channel 6 input AD6 pin of ADC

- 0 → P65 (I/O PORT65) pin is selected
- 1 → AD6 (Channel 6 input of ADC) pin is selected

Bit 6(P66S) : Select normal I/O PORT66 pin or external reference voltage input of ADC

- 0 → P66 (I/O PORT66) pin is selected and ADC reference voltage come from internal VDD
- 1 → VREF (External reference voltage input of ADC) pin is selected

This bit can switch AD converter reference voltage coming from internal or external voltage.

If this bit set to internal, then the reference voltage will be VDD and PORT66 is a normal I/O PORT. If it set to external reference voltage, then the voltage will connected to VREF pin.

Bit 7 : (undefined) not allowed to use

#### IOC7 (PORT7 I/O control, PORT7 pull high control)

PAGE0 (PORT7 I/O control register)

| - | R/W-0 | - | - | R/W-0    | - | - | - |

Bit 0 ~ Bit 2 : Unused. These 3 bits are not allowed to use.

Bit 3(DAST/P67) : DAC enable control or P67 switch

0 → switch DAO/P67 pin as normal I/O P67

1 → enable DAC, enable DAC output buffer B1 and DAC output to DAO/P67 pin

When this bit is set by software, the DA converter will start converting and output to DAO/P67 pin. If user clean this bit, DA converter will stop and DAO/P67 pin will be become normal I/O P67.

Bit 4 ~ Bit 5 : Unused. These two bits are not allowed to use.

Bit 6(VREF) : Reference voltage selection bit for DA converter circuit

DAC reference setting is shown as following. Also see Fig.12 in the next page.

| VREF | DAST/P67 | Function   |
|------|----------|--|
| x    | 0        | disable 2.5V, disable DAC  |
| 1    | 1        | select 2.5V ref, enable 2.5V ref, enable DAC, enable output to DAO/P67 pin |
| 0    | 1        | select VDD, disable 2.5V, enable DAC, enable output to DAO/P67 pin         |

| 1      | 1      | 4.7K          | >=2.5V            |

This is a CMOS multi-channel 10-bit successive approximation A/D converter.

Features

74.6kHz maximum conversion speed at 5V.

Adjusted full scale input

External reference voltage input or internal(VDD) reference voltage

6 analog inputs multiplexed into one A/D converter

Power down mode for power saving

A/D conversion complete interrupt

Interrupt register, A/D control and status register, and A/D data register

### IOCE (Interrupt mask)

#### PAGE0 (Interrupt mask)

| 7     | 6     | 5     | 4     | 3      | 2      | 1      | 0      |
|-------|-------|-------|-------|--------|--------|--------|--------|
| PWM2  | RBF   | ADI   | PWM1  | /WUP83 | /WUP82 | /WUP81 | /WUP80 |
| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0  | R/W-0  | R/W-0  | R/W-0  |

Bit 0 (/WUP80) : PORT80 wake-up control, 0/1 → disable/enable P80 pin wake-up function

Bit 1 (/WUP81) : PORT81 wake-up control, 0/1 → disable/enable P81 pin wake-up function

Bit 2 (/WUP82) : PORT82 wake-up control, 0/1 → disable/enable P82 pin wake-up function

Bit 3 (/WUP83) : PORT83 wake-up control, 0/1 → disable/enable P83 pin wake-up function

Bit 4 (PWM1) : PWM1 interrupt enable bit

0/1 → disable/enable interrupt

Bit 5 (ADI) : ADC conversion complete interrupt mask

0/1 → disable/enable interrupt

There are four registers for A/D converter. Use one bit of interrupt control register (IOCE PAGE0 Bit5) for A/D conversion complete interrupt. The status and control register of A/D (IOCB PAGE1 and RE PAGE0 Bit5) responses the A/D conversion status or takes control on A/D. The A/D data register (RB PAGE1) stores A/D conversion result.

ADI bit in IOCE PAGE0 register is end of A/D conversion complete interrupt enable/disable. It enables/disables ADI flag in RE register when A/D conversion is complete. ADI flag indicates the end of an A/D conversion. The A/D converter sets the interrupt flag, ADI in RE PAGE0 register when a conversion is complete. The interrupt can be disabled by setting ADI bit in IOCE PAGE0 Bit5 to '0'.

The A/D converter has six analog input channels AD1~AD6 multiplexed into one sample and hold to A/D module. Reference voltage can be driven from VREF pin or internal power. The A/D converter itself is of an 10-bit successive approximation type and produces an 10-bit result in the RB PAGE1 and R7 PAGE1 data register. A conversion is initiated by setting a control bit ADST in IOCB PAGE1 Bit0. Prior to conversion, the appropriate channel must be selected by setting IN0~IN1 bits in RE register and allowed for enough time to sample data. Every conversion data of A/D need 12-clock cycle time. The minimum conversion time required is 13 us (74K sample rate). ADST Bit in IOCB PAGE1 Bit0 must be set to begin a conversion.

It will be automatically reset in hardware when conversion is complete. At the end of conversion, the START bit is cleared and the A/D interrupt is activated if ADI in IOCE PAGE0 Bit5 = 1. ADI will be set when conversion is complete. It can be reset in software.

\* This specification is subject to be changed without notice.

If ADI = 0 in IOCE PAGE0 Bit5, when A/D start conversion by setting ADST(IOCB PAGE1 Bit0) = 1 then A/D will continue conversion without stop and hardware won't reset ADST bit. In this condition, ADI is deactivated. After ADI in IOCE PAGE0 bit5 is set, ADI in RE PAGE0 bit5 will activate again.

To minimum operating current, all biasing circuits in the A/D module that consume DC current are power down when ADPWR bit in IOCB PAGE1 Bit2 register is a '0'. When ADPWR bit is a '1', A/D converter module is operating.

User has to set PORT60~ PORT65 as AD converter input pin or bi-direction IO PORT.

Fig.15 A/D converter timing

Bit 6 (RBF) : SPI's RBF interrupt mask

0/1 → disable/enable interrupt

Bit 7 (PWM2) : PWM2 interrupt enable bit

0/1 → disable/enable interrupt

### IOCF (Interrupt mask)

(Interrupt mask register)

| Bit7  | Bit6  | Bit5  | Bit4  | Bit3  | Bit2  | Bit1  | Bit0  |
|-------|-------|-------|-------|-------|-------|-------|-------|
| INT3  | 0     | INT2  | INT1  | INT0  | CNT2  | CNT1  | TCIF  |
| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

Bit 0 ~ 5,7 : interrupt enable bit

0 → disable interrupt

1 → enable interrupt

Bit 6 : (remain these values to "0" otherwise it will generate unpredicted interrupts)

The status after interrupt and the interrupt sources list as the table below.

| Interrupt signal                         | GREEN mode                                   | NORMAL mode                                  |

| ADI<br>IOCE bit5 = 1<br>And "ENI"                                 | No function                                       | Interrupt<br>(jump to address 8 at<br>page0) |
| PWM1<br>IOCE bit4 = 1<br>And "ENI"                                | Interrupt <ps><br>(jump to address 8 at<br>page0) | Interrupt<br>(jump to address 8 at<br>page0) |
| PWM2<br>IOCE bit7 = 1<br>And "ENI"                                | Interrupt <ps><br>(jump to address 8 at<br>page0) | Interrupt<br>(jump to address 8 at<br>page0) |

<Note> PORT70 's interrupt function is controlled by IOCF bit 3. It's falling edge or rising edge trigger (controlled by CONT register bit7).

PORT7(1~3) 's wakeup functions are controlled by IOCF bit (4,5,7). They are falling edge trigger.

ADI interrupt source function is controlled by RE PAGE0 bit 5. It is rising edge trigger after ADC sample complete.

<ps> It only happens when master and 16.386kHz mode is selected.

### VII.4 I/O Port

The I/O registers are bi-directional tri-state I/O ports. The I/O ports can be defined as "input" or "output" pins by the I/O control registers under program control. The I/O data registers and I/O control registers are both readable and writable. The I/O interface circuit is shown in Fig.16.

Fig.16\_1 The circuit of I/O port and I/O control register

Fig.16\_2 The input/output circuit of EM78P569 input/output ports

## VII.5 RESET

The RESET can be caused by

- (1) Power on reset
- (2) WDT timeout. (if enabled and in GREEN or NORMAL mode)
- (3) /RESET pin pull low

Once the RESET occurs, the following functions are performed.

- The oscillator is running, or will be started.
- The Program Counter (R2) is set to all "0".
- When power on, the upper 3 bits of R3 and the upper 2 bits of R4 are cleared.
- The Watchdog timer and pre-scaler counter are cleared.
- The Watchdog timer is disabled.
- The CONT register is set to all "1"
- The other register (bit 7 ~ bit 0) default values are as follows.

Operation registers :

| Address | R register<br>PAGE0 | R register<br>PAGE1 | R register<br>PAGE2 | R register<br>PAGE3 | IOC register<br>PAGE0 | IOC register<br>PAGE1 |

| 0xE     | 00000000            |                     | xxxxxxxx            |                     | 0000xxxx              | xxxxxxxx              |
| 0xF     | 00000000            |                     |                     |                     | 00000000              |                       |

## VII.6 Wake-up

The controller provided sleep mode for power saving :

- (1) SLEEP mode, RA(7) = 0 + "SLEP" instruction

The controller will turn off all the CPU and crystal. Other circuit with power control like key tone control or PLL control (which has enable register), user has to turn it off by software.

Wake-up from SLEEP mode

- (1) WDT time out
- (2) External interrupt
- (3) /RESET pull low

All these cases will reset controller , and run the program at address zero. The status just like the power on reset.

## VII.7 Interrupt

RF is the interrupt status register which records the interrupt request in flag bit. IOCF is the interrupt mask register. Global interrupt is enabled by ENI instruction and is disabled by DISI instruction. When one of the interrupts (when enabled) generated, will cause the next instruction to be fetched from address 008H. Once in the interrupt service routine, the source of the interrupt can be determined by polling the flag bits in the RF register.

The interrupt flag bit must be cleared in software before leaving the interrupt service routine and enabling interrupts to avoid recursive interrupts.

## VII.8 Instruction Set

Instruction set has the following features:

- (1) Every bit of any register can be set, cleared, or tested directly.
- (2) The I/O register can be regarded as general register. That is, the same instruction can operate on I/O register.

The symbol "R" represents a register designator which specifies which one of the 64 registers (including operational registers and general purpose registers) is to be utilized by the instruction. Bits 6 and 7 in R4 determine the selected register bank. "b" represents a bit field designator which selects the number of the bit, located in the register "R", affected by the operation. "k" represents an 8 or 10-bit constant or literal value.

| INSTRUCTION BINARY      | HEX         | MNEMONIC     | OPERATION                               | STATUS AFFECTED | Instruction Cycle** |

## VII.9 Code Option

### CODE Option Register

|    |    |     |        |   |   |   |   |   |   |     |   |   |       |
|----|----|-----|--------|---|---|---|---|---|---|-----|---|---|-------|
| 13 | 12 | 11  | 10     | 9 | 8 | 7 | 6 | 5 | 4 | 3   | 2 | 1 | 0     |
|    |    | PHO | VERSEL | 1 |   |   |   |   |   | MER |   |   | /POT0 |

Bit 0 (/POT0): program ROM protect option.

If set 1 to the bit, program memory can be access; else if clear this bit , program memory can not be access.

Bit 3(MER) : Memory error recover function

0 → disable memory error recover function

1 → enable memory error recovery function

If user enable memory error recovery function, MCU will improve effect from environment noise.

Bit 9: This bit must set to 1.

Bit 10(VERSEL) : Version select.

|                                   | VERSEL = 0  | VERSEL = 1                  |
|-----------------------------------|-------------|-----------------------------|
| Data RAM address                  | R8 page1    | RB page2                    |
| Data ram address auto-increase    | Not support | Enable                      |
| “ADD” & “SUB” include “carry“ bit | Not support | Determined by RA page2 bit7 |

Bit 11(PHO) : PORTCO status select.

0 → PORTCO defined to normal IO.

1 → PORTCO defined to phase1 output, next figure show the relative of main CLK and Phase1 CLK.

The relative between main CLK and PH1 output

## VII.10 Dual sets of PWM (Pulse Width Modulation)

### (1) Overview

In PWM mode, both PWM1 and PWM2 pins produce up to a 10-bit resolution PWM output (see. Fig.17 for the functional block diagram). A PWM output has a period and a duty cycle, and it keeps the output in high. The baud rate of the PWM is the inverse of the period. Fig.18 depicts the relationships between a period and a duty cycle.

Fig.17 The Functional Block Diagram of the Dual PWMs

Fig.18 The Output Timing of the PWM

### (2) Increment Timer Counter ( TMRX: TMR1H/TWR1L or TMR2H/TWR2L )

TMRX are ten-bit clock counters with programmable prescalers. They are designed for the PWM module as baud rate clock generators. TMRX can be read, written, and cleared at any reset conditions. If employed, they can be turned down for power saving by setting T1EN bit [PWMCON<4>] or T2EN bit [PWMCON<5>] to 0.

(3) PWM Period ( PRDX : PRD1 or PRD2 )

The PWM period is defined by writing to the PRDX register. When TMRX is equal to PRDX, the following events occur on the next increment cycle:

- TMRX is cleared.
  - The PWMX pin is set to 1.
  - The PWM duty cycle is latched from DT1/DT2 to DTL1/DTL2.
- < Note > The PWM output will not be set, if the duty cycle is 0;
- The PWMXIF pin is set to 1.

The following formula describes how to calculate the PWM period:

$$\text{PERIOD} = (\text{PRDX} + 1) * 4 * (1/\text{Fosc}) * (\text{TMRX prescale value})$$

Where Fosc is system clock

(4) PWM Duty Cycle ( DTX: DT1H/ DT1L and DT2H/ DT2L; DTL: DL1H/DL1L and DL2H/DL2L )

The PWM duty cycle is defined by writing to the DTX register, and is latched from DTX to DLX while TMRX is cleared. When DLX is equal to TMRX, the PWMX pin is cleared. DTX can be loaded at any time. However, it cannot be latched into DTL until the current value of DLX is equal to TMRX.

The following formula describes how to calculate the PWM duty cycle:

$$\text{Duty Cycle} = (\text{DTX}) * (1/\text{Fosc}) * (\text{TMRX prescale value})$$

(5) Comparator X

To change the output status while the match occurs, the TMRXIF flag will be set at the same time.

(6) PWM Programming Procedures/Steps

Load PRDX with the PWM period.

(1) Load DTX with the PWM Duty Cycle.

(2) Enable interrupt function by writing IOCF PAFE0, if required.

(3) Set PWMX pin to be output by writing a desired value to IOCC PAGE0.

(4) Load a desired value to R5 PAGE3 with TMRX prescaler value and enable both PWMX and TMRX.

(7) Timer

Timer1 (TMR1) and Timer2 (TMR2) (TMRX) are 10-bit clock counters with programmable prescalers, respectively. They are designed for the PWM module as baud rate clock generators. TMRX can be read, written, and cleared at any reset conditions.

The figure in the next page shows TMRX block diagram. Each signal and block are described as follows:

Fig.19 TMRX Block Diagram

- Fosc: Input clock.
- Prescaler ( T1P0 and T1P1/T2P1 and T2P0 ): Options of 1:2, 1:8, 1:32, and 1:64 are defined by TMRX. It is cleared when any type of reset occurs.
- TMR1X and TMR2X (TMR1H/TWR1L and TMR2H/TMR2L ):Timer X register; TMRX is increased until it matches with PRDX, and then is reset to 0. TMRX cannot be read.
- PRDX ( PRD1 and PRD2 ): PWM period register.
- ComparatorX ( Comparator 1 and Comparator 2 ): To reset TMRX while a match occurs and the TMRXIF flag is set at the same time.

When defining TMRX, refer to the related registers of its operation as shown in prescale register. It must be noted that the PWMX bits must be disabled if their related TMRXs are employed. That is, bit 7 and bit 6 of the PWMCON register must be set to '0'.

Related Control Registers(R5 PAGE3) of TMR1 and TMR2

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------|-------|-------|-------|-------|-------|-------|-------|
| PWM2E | PWM1E | T2EN  | T1EN  | T2P1  | T2P0  | T1P1  | T1P0  |

Timer programming procedures/steps

- (1) Load PRDX with the TIMER period.
- (2) Enable interrupt function by writing IOCF PAGE0, if required
- (3) Load a desired value to PWMCON with the TMRX prescaler value and enable both TMRX and disable PWMX.

### VIII. Absolute Operation Maximum Ratings

| RATING                      | SYMBOL          | VALUE            | UNIT |
|-----------------------------|-----------------|------------------|------|
| DC SUPPLY VOLTAGE           | VDD             | -0.3 To 6        | V    |
| INPUT VOLTAGE               | V <sub>in</sub> | -0.5 to VDD +0.5 | V    |
| OPERATING TEMPERATURE RANGE | T <sub>a</sub>  | 0 to 70          |      |

### IX. DC Electrical Characteristic

(T<sub>a</sub> = 25°C, AVDD=VDD=5V±5%, VSS=0V)

| Parameter                                     | Symbol | Condition   | Min | Typ   | Max | Unit |

## XI. AC Electrical Characteristic

CPU instruction timing (Ta = 25°C, AVDD=VDD=5V, VSS=0V)

| Parameter              | Symbol | Condition | Min         | Typ | Max | Unit |
|------------------------|--------|-----------|-------------|-----|-----|------|
| Input CLK duty cycle   | Dclk   |           | 45          | 50  | 55  | %    |
| Instruction cycle time | Tins   | 32.768kHz |             | 60  |     | us   |
|                        |        | 3.582MHz  |             | 550 |     | ns   |
| Device delay hold time | Tdrh   |           |             | 16  |     | ms   |
| TCC input period       | Ttcc   | Note 1    | (Tins+20)/N |     |     | ns   |
| Watchdog timer period  | Twdt   | Ta = 25°C |             | 16  |     | ms   |
| DAC output delay       | Tda    |           |             | 50  |     | uS   |

Note 1: N= selected prescaler ratio.

ADC characteristic (VDD = 5V, Ta = +25°C, for internal reference voltage)

| Parameter                  | Symbol | Condition | Min | Typ | Max  | Unit |
|----------------------------|--------|-----------|-----|-----|------|------|
| Upper bound offset voltage | Vofh   |           |     | 44  | 52.8 | mV   |
| Lower bound offset voltage | Vofl   |           |     | 32  | 38.4 | mV   |

\*These parameters are characterized but not tested.

\* About ADC characteristic, please refer to next page.

Timing characteristic (AVDD=VDD=5V, Ta=+25°C)

| Description  | Symbol       | Min   | Typ | Max  | Unit |
|--|--------------|-------|-----|------|------|
| <b>Oscillator timing characteristic</b>                                    |              |       |     |      |      |
| OSC start up   | 32.768kHz    | Toscs | 400 | 1500 | ms   |
|  | 3.579MHz PLL |       | 5   | 10   | us   |
| <b>SPI timing characteristic (CPU clock 3.58MHz and Fsc0 = 3.58Mhz /2)</b> |              |       |     |      |      |
| /SS set-up time  | Tcss         | 560   |     |      | ns   |
| /SS hold time  | Tcsh         | 250   |     |      |      |
| SCLK high time   | Thi          | 250   |     |      | ns   |
| SCLK low time  | Tlo          | 250   |     |      | ns   |
| SCLK rising time   | Tr           |       | 15  | 30   | ns   |
| SCLK falling time  | Tf           |       | 15  | 30   | ns   |
| SDI set-up time to the reading edge of SCLK                                | Tisu         | 25    |     |      | ns   |
| SDI hold time to the reading edge of SCLK                                  | Tihd         | 25    |     |      | ns   |
| SDO disable time   | Tdis         |       |     | 560  | ns   |
| <b>Timing characteristic of reset</b>                                      |              |       |     |      |      |
| The minimum width of reset low pulse                                       | Trst         | 3     |     |      | uS   |
| The delay between reset and program start                                  | Tdrs         |       | 18  |      | mS   |

Embedded LCD driver

| Symbol | Parameter                | Condition           | Min | Typ | Max | Unit |
|--------|--------------------------|---------------------|-----|-----|-----|------|
| Ron    | LCD driver ON resistance | LCD function enable |     | 2   | 4   | kΩ   |
| Frame  | LCD frame frequency      | 1/2 , 1/4 duty      |     | 64  |     | Hz   |

EM78P569 operation voltage(X axis  $\rightarrow$  min VDD ; Y axis  $\rightarrow$  main CLK):

\* This specification is subject to be changed without notice.

### EM78569 10 bit ADC characteristic

EM78569 build in 10 bit resolution, multi channel ADC function. In ideal, if ADC's reference voltage is 5V, the ADC's LSB will be 5V/1024. But in practical, for some physics or circuit's character, some un-ideal will effect the converter result. As the next figure, offset voltage will reduce AD's converter range. If AD's input voltage less than VOFL, ADC will output 0; in opposition, if input voltage is larger than (VDD-VOFH), ADC will output 1023. That is to say the physics AD converter range will replace by (VDD-VOFH+LSB-VOFL+LSB). If we defined that VRB = VOFL - LSB and VRT = VDD-VOFH+LSB, the physics LSB is:

$$\begin{aligned} \text{LSB} &= (\text{VRT} - \text{VRB}) / 1024 \\ &= (\text{VDD} - (\text{VOFH} + \text{VOFL})) / 1022 \end{aligned}$$

For real operating, please think about the effect of AD's offset voltage. If converter the range of (VRT - VRB), the AD converter's opposite result will be précised.

Fig.20 The relative between ADC and offset voltage

## XII. Timing Diagrams

### AC Test Input/Output Waveform

**AC Testing:** Input are driven at 2.4V for logic "1", and 0.45V for logic "0". Timing measurements are made at 2.0V for logic "1", and 0.8V for logic "0".

### XIII. Appendix

#### Function control list:

##### ● ADC

- ADRES → R7 page1 bit2
- AD8~AD9 → R7 page1 bit4~bit5
- AD0~AD7 → RB page1
- AD/IO pin select → IOC6 page1 bit0~bit6
- AD power control → IOCB page1

##### ● DAC

- DA8~DA9 → R5 page1 bit6~bit7
- DARES → R7 page1 bit3
- DA0~DA7 → RA page1 bit0~bit7
- DAST → IOCA page1 bit3
- DAREF → IOCA page1 bit6

##### ● SPI

- SPI control → R5 page2
- SPI data → R6 page2

##### ● LCD driver

- LCD address → R5 page1 bit0~3
- LCD data → R6 page1
- LCD mode select → RD page0 bit0~bit2
- LCD bias → IOC5 page0 bit0~bit3
- LCD io/seg pin select → IOC9 page1, IOCC page1

##### ● PWM

- PWM control → R5 page3
- PWM1 duty control bit0~bit7 → R6 page3
- PWM1 duty control bit8~bit9 → R7 page3 bit0~bit1
- PWM1 period control → R8 page3
- PWM2 duty control bit0~bit7 → R9 page3
- PWM2 duty control bit8~bit9 → RA page3 bit0~bit1
- PWM1 period control → RB page3

##### ● Data RAM access

###### **VERSEL = 0:**

- RAM bank → R7 page1 bit0~bit1
- RAM address → R8 page1
- RAM data → R9 page1

###### **VERSEL = 1:**

- RAM bank → R7 page1 bit0~bit1
- RAM address → RB page2
- RAM data → R9 page1

- Multiplier

- Multiplier control → RA page2

- Multiplication X → ACC

- Multiplication Y → RB page2

- Multiplication Result 0~7 → RC page2

- Multiplication Result 8~15 → RD page2

- Multiplication Result 16~23 → RE page2

**\*\*Multiplier instruction is “INT A”**
