

**SONY****CXA1884N****Low-voltage FM IF Amplifier****Description**

The CXA1884N is designed for FM communication devices. They incorporate a paging system, mixer, IF limiter, FM detector, operational amplifier, comparator, and others.

**Features**

- Low operating voltage 1.0 to 4.0V
- Low power consumption 2mA at 1.5V
- Built-in power source voltage monitor

**Applications**

IF Amplifier for Paging System Receiver

**Structure**

Bipolar silicon monolithic IC

20 pin SSOP (Plastic)

**Absolute Maximum Ratings** (Ta = 25°C)

- Supply voltage Vcc 7 V
- Operating temperature Topr -20 to +75 °C
- Storage temperature Tstg -65 to +150 °C

**Recommended Operating Conditions**

- Supply voltage Vcc 1.0 to 4.0 V

**Block Diagram and Pin Configuration**

**Note)** DET.: DETECTOR  
 LIM.: LIMITER  
 REG.: REGULATOR  
 ERR.: ERROR CORRECTION

## Pin Description

Pin No.	Symbol	Equivalent circuit	Description
1	OSC1		Those pins are connected to the external parts of an oscillating circuit. The oscillator is an internally-biased Colpitts type with the collector, base, and emitter connections at Vcc, pins 1 and 2 respectively.
2	OSC2		
3	MIX OUT		Mixer output pin. Connect a 455kHz ceramic filter between this pin and the IF IN pin.
4	Vcc		Vcc pin.
5	IF IN		Input pin for the IF limiter amplifier.
6	IF P1		Connection pin of the bypass capacitor for the IF limiter amplifier. Connect a capacitor of about 0.047μF between this pin and ground (or Vcc).
7	IF P2		Connection pin of the bypass capacitor for the IF limiter amplifier. Connect a capacitor of about 0.047μF between this pin and ground (or Vcc).
8	QD		Connected to a quadrature detector phase shifter.

Pin No.	Symbol	Equivalent circuit	Description
9	DET OUT		Recovered signal output.
10	A1 IN		Input pin of inverting OP amplifier A1.
11	A1 OUT		Output pin of OP amplifier A1.
12	A2 IN		Input pin of OP amplifier A2.
13	COMP IN		Input pin of the comparator. This pin is internally connected to the output of OP amplifier A2.

Pin No.	Symbol	Equivalent circuit	Description
14	NRZ		NRZ (Non Return Zero) output pin.
15	SENSE		Voltage control pin for external bias supply.
16	VB OUT		Supplies bias voltage to external circuit transistors and others.
17	$\overline{\text{BSV}}$		Reduces IC power consumption. Lowering pin voltage below 0.35V stops IC operation.
18	LVA		Output pin for Low Voltage Alarm (LVA). The pin turns to high impedance when power voltage drops below 1.05V.
19	GND		Ground pin.
20	RF IN		Mixer input pin.

\* NRZ: Non Return Zero

The diagram shows a 20-pin connector with pins numbered 1 through 20. Pins 1-10 are on the left, and pins 11-20 are on the right. A curved line at the top connects pin 1 to pin 20. Pin 4 is connected to a 1.5V source labeled  $V_{cc}$ . Pin 8 is connected to a 0.95V source labeled  $V_I$ . Pins 17 and 19 are connected to ground symbols.

The diagram shows a 40-pin DIP package with the following connections:

- Pin 1:** Connected to a 22pF capacitor.
- Pin 2:** Connected to a 15pF capacitor.
- Pin 3:** Connected to a 455k resistor (CF1).
- Pin 4:** Connected to a 0.047μF capacitor (CP1).
- Pin 5:** Connected to a 0.047μF capacitor (CP2).
- Pin 6:** Connected to a 4.7k resistor.
- Pin 7:** Connected to a 1.5V DC source (Vcc).
- Pin 8:** Connected to a 4.7k resistor.
- Pin 9:** Connected to a 1.5V DC source (Vcc).
- Pin 10:** Output signal (Vo).
- Pin 11:** Ground.
- Pin 12:** Ground.
- Pin 13:** Ground.
- Pin 14:** Ground.
- Pin 15:** Ground.
- Pin 16:** Connected to a 0.95V source (VI).
- Pin 17:** Ground.
- Pin 18:** Ground.
- Pin 19:** Ground.
- Pin 20:** Connected to a 100pF capacitor (C IN 1).
- Pin 21:** Connected to a 50Ω load resistor (RL).
- Pin 22:** Ground.
- Pin 23:** Ground.
- Pin 24:** Ground.
- Pin 25:** Ground.
- Pin 26:** Ground.
- Pin 27:** Ground.
- Pin 28:** Ground.
- Pin 29:** Ground.
- Pin 30:** Ground.
- Pin 31:** Ground.
- Pin 32:** Ground.
- Pin 33:** Ground.
- Pin 34:** Ground.
- Pin 35:** Ground.
- Pin 36:** Ground.
- Pin 37:** Ground.
- Pin 38:** Ground.
- Pin 39:** Ground.
- Pin 40:** Ground.

The diagram shows a 20-pin U-shaped component with pins numbered 1 to 20. The connections are as follows:

- Pin 1:** Connected to Pin 20 via a top arc.
- Pin 2:** Connected to Pin 19.
- Pin 3:** Connected to Pin 18.
- Pin 4:** Connected to Pin 17.
- Pin 5:** Connected to Pin 16.
- Pin 6:** Connected to Pin 15.
- Pin 7:** Connected to Pin 14.
- Pin 8:** Connected to Pin 13.
- Pin 9:** Connected to Pin 12.
- Pin 10:** Connected to Pin 11.
- Pin 11:** Connected to Pin 10.
- Pin 12:** Connected to Pin 9.
- Pin 13:** Connected to Pin 8.
- Pin 14:** Connected to Pin 7.
- Pin 15:** Connected to Pin 6.
- Pin 16:** Connected to Pin 5.
- Pin 17:** Connected to Pin 4.
- Pin 18:** Connected to Pin 3.
- Pin 19:** Connected to Pin 2.
- Pin 20:** Connected to Pin 1.

External components and connections:

- Pin 1:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 2:** Connected to a 10μF capacitor (C IN 2) which is connected to Pin 10.
- Pin 3:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 4:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 5:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 6:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 7:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 8:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 9:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 10:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 11:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 12:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 13:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 14:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 15:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 16:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 17:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 18:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 19:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.
- Pin 20:** Connected to a 10k resistor (RNF2) which is connected to Pin 10.

Power and signal sources:

- V<sub>CC</sub> 1.5V:** Connected to Pin 10.
- V<sub>I</sub> 0.95V:** Connected to Pin 10.
- V IN 1 0.1Vp-p:** Connected to Pin 10.
- V IN 2 0.1Vp-p:** Connected to Pin 10.

Test circuit 7

Test circuit 8

Test circuit 9

Test circuit 10

## Test Method

### Input for –3dB Limiting $V_{IN}$ (LIM)

Use test circuit 3. Apply a signal with the following characteristics to SIG IN.

Signal frequency:  $f_s = 21.7\text{MHz}$       Modulation frequency:  $f_{MOD} = 256\text{Hz}$

Frequency deviation:  $f_{DIV} = 2.3\text{kHz}$       Signal level:  $V_L = 40\text{dB}\mu$

Here, the value of  $V_{AC}$  is specified as  $V_{AC1}$ . Next, the signal level  $V_L$  is changed to  $19\text{dB}\mu$  and  $V_{AC}$  value is hence specified as  $V_{AC2}$ .

$$20 \log \frac{V_{AC1}}{V_{AC2}} < 3\text{dB}$$

### AM rejection ratio (AMRR)

Use test circuit 3. Apply a signal with the following characteristics to SIG IN.

Signal frequency:  $f_s = 21.7\text{MHz}$       Modulation frequency:  $f_{MOD} = 256\text{Hz}$

Frequency deviation:  $f_{DIV} = 2.3\text{kHz}$       Signal level:  $V_L = 40\text{dB}\mu$

Here, the value of  $V_{AC}$  is specified as  $V_{AC1}$ . Next, AM is modified to:

Modulation ratio:  $AM_{MOD} = 30\%$       Modulation frequency:  $f_{MOD} = 256\text{Hz}$

and the  $V_{AC}$  value is hence specified as  $V_{AC2}$ .

$$AMRR = 20 \log \frac{V_{AC1}}{V_{AC2}} > 25\text{dB}$$

### Recovered signal voltage $V_{DET}$

Use test circuit 3. Apply a signal with the following characteristics to SIG IN.

Signal frequency:  $f_s = 21.7\text{MHz}$       Modulation frequency:  $f_{MOD} = 256\text{Hz}$

Frequency deviation:  $f_{DIV} = 2.3\text{kHz}$       Signal level:  $V_L = 50\text{dB}\mu$

Here, the value of the Pin 9 output voltage is expressed as  $V_{DET}$ .

### OP amplifier output voltage amplitude $V_o$

Use test circuit 5. If output voltage  $V$  is expressed as  $V_1$  when  $V_{IN}$  is  $0.1\text{V}$ , and as  $V_2$  when  $V_{IN}$  is  $0.3\text{V}$ , it follows that:

$$V_o = V_1 - V_2$$

### Comparator hysteresis width $V_{TW}$

Use test circuit 6. Vary  $V_{IN}$  between  $0.1$  to  $0.3\text{V}$ .

Specify  $V_{IN}$  voltage, as  $V_1$  when (C) voltage changes from low to high.

Similarly, specify  $V_{IN}$  voltage as  $V_2$ , when (C) voltage changes from high to low.

$$\text{Therefore: } V_{HY} \quad V_{TW} = V_1 - V_2$$

### LVA threshold voltage $V_{PML}$ and recovery voltage $V_{PMH}$

Use test circuit 10. Vary power voltage  $V_{CC}$  from  $1.3$  to  $0.95\text{V}$ .

Specify  $V_{CC}$  as  $V_{PML}$ , when (C) voltage changes from low to high.

Similarly, specify  $V_{CC}$  as  $V_{PMH}$ , when (C) voltage changes from high to low.

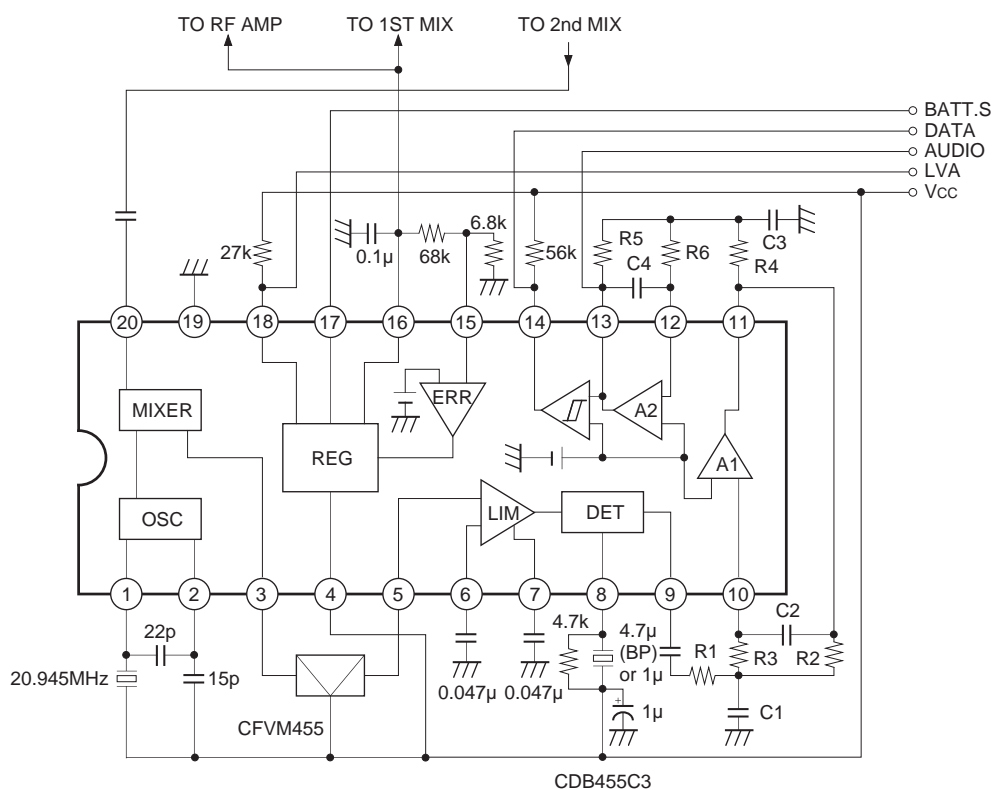

## Design Reference Values

## Application Circuit

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

### 1) Supply

This IC incorporates a regulation and is designed to operate steadily on a wide range of supply voltage from 1.0 to 4.0V.

Decoupling on the wiring to the supply pin (Pin 4) should be done as close to the pin as possible.

### 2) Oscillation input

Oscillation input method

- (a) Using Pins 1 and 2, input self-excited oscillation signals through the composition of a Colpitts type crystal oscillating circuit.
- (b) Input local oscillation signals to Pin 1 directly.

Fig. 1

### 3) Mixer

This IC's mixer is of the double balance type. Pin 24 is the input pin. Input through a suitable alignment circuit. Input impedance is at 1.6k $\Omega$ . The mixer output features a built-in 1.6k $\Omega$  load resistance at Pin 3.

### 4) IF filter

The filter to be connected between this IC's mixer and the IF limiter should have the following specifications.

I/O impedance: 1.6k $\Omega$   $\pm$  10%

Band width: Use according to application

## 5) IF limiter

The IF limiter of this IC features a gain of about 100dB. To this effect, the following points should be considered for the wiring connecting IF limiter input pin (Pin 5) and decoupling capacitor pins (Pins 6 and 7).

- Wiring to mixer output (Pin 3) and IF limiter input (Pin 5) should be as short and as far apart as possible to avoid neutral interference.
- Connect a decoupling capacitor to IF limiter IF P1 (Pin 6) and IF P2 (Pin 7).  
Here the decoupling capacitor should be positioned as close as possible to each pin and the wiring be as short as can be.
- As IF limiter output shows at QD (Pin 8), keep the wiring connected to QD pin R, L, C and the ceramic discriminator as short as possible. Interference to the mixer output, IF limiter input and others must be kept to a minimum.

Fig. 2

## 6) Detector

The detector is of the quadrature type. To phase shift, either R, L, C resonance circuit or the ceramic discriminator is connected to Pin 8.

The phase capacitor of the quadrature detector is built-in. FM (FSK) signals demodulated by this detector have their high frequency components dropped by the LPF formed inside from CRs, to be output at DET OUT (Pin 9). DET OUT output impedance is about 3k $\Omega$ .

For the CXA1884N ceramic discriminator, CDB 455 C3 (Murata Production) is recommended.

Fig. 3

## 7) OP AMP, NRZ OUT

This IC has 2 built-in operation amplifiers.

One of these operation amplifiers is connected inside the IC to NRZ comparator.

Fig. 4

Making use of these operation amplifiers an LPF or the sort is made up to eliminate noise during signal demodulation and input to the following NRZ comparator.

NRZ comparator molds the waveform of input signals to output them as square waves. NRZ comparator output is an open collector.

Accordingly as CPU is a CMOS, in case the supply voltage differs, by following the method indicated in Fig. 5 direct interfacing becomes possible.

Fig. 5

## 8) VB SENSE, VB OUT

This controls the base bias of the external transistor. Pin 16 VB OUT can be used as the previous amplifier 1st mixer bias.

## 9) LVA OUT

When supply voltage turns low this pin turns to High (Open). Output is an open collector, and similarly as NRX OUT, can directly drive CMOS.

This LVA setting voltage is at  $1.05V \pm 50mV$  with hysteresis versus supply voltage.

Hysteresis width is at  $50mV \pm 10mV$ .

**10)  $\overline{\text{BSV}}$** 

By turning this pin to low, this IC's operation can be stopped.

This pin can also be directly connected to CMOS.

Consumption current with  $\overline{\text{BSV}}$  is 20 $\mu\text{A}$  (at 1.5V) and below.

**Fig. 6**

**4th LP Butterworth cascade MFB constant using OP1 and OP2 inside CXA1884N**

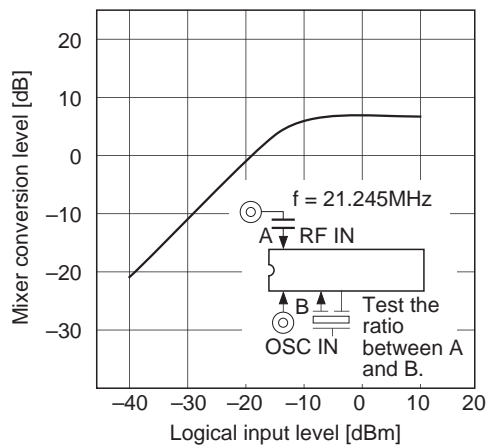

fMOD	256Hz
