2 Mbit / 4 Mbit / 8 Mbit (x16) Multi-Purpose Flash SST39LF200A / SST39LF400A / SST39LF800A SST39VF200A / SST39VF400A / SST39VF800A

FEATURES:

- Organized as 128K x16 / 256K x16 / 512K x16
- Single Voltage Read and Write Operations
 - 3.0-3.6V for SST39LF200A/400A/800A
 - 2.7-3.6V for SST39VF200A/400A/800A
- Superior Reliability
 - Endurance: 100,000 Cycles (typical)
 - Greater than 100 years Data Retention
- Low Power Consumption
 - Active Current: 20 mA (typical)
 - Standby Current: 3 µA (typical)
- Sector-Erase Capability
 - Uniform 2 KWord sectors
- Block-Erase Capability
 - Uniform 32 KWord blocks
- Fast Read Access Time
 - 45 and 55 ns for SST39LF200A/400A
 - 55 ns for SST39LF800A
 - 70 and 90 ns for SST39VF200A/400A/800A
- Latched Address and Data

PRODUCT DESCRIPTION

The SST39LF200A/400A/800A and SST39VF200A/400A/ 800A devices are 128K x16 / 256K x16 / 512K x16 CMOS Multi-Purpose Flash (MPF) manufactured with SST's proprietary, high performance CMOS SuperFlash technology. The split-gate cell design and thick oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The SST39LF200A/400A/800A write (Program or Erase) with a 3.0-3.6V power supply. The SST39VF200A/400A/800A write (Program or Erase) with a 2.7-3.6V power supply. These devices conform to JEDEC standard pinouts for x16 memories.

Featuring hiah performance Word-Program, the SST39LF200A/400A/800A and SST39VF200A/400A/ 800A devices provide a typical Word-Program time of 14 µsec. The devices use Toggle Bit or Data# Polling to detect the completion of the Program or Erase operation. To protect against inadvertent write, they have on-chip hardware and software data protection schemes. Designed, manufactured, and tested for a wide spectrum of applications, these devices are offered with a guaranteed endurance of 10,000 cycles. Data retention is rated at greater than 100 years.

The SST39LF200A/400A/800A and SST39VF200A/400A/ 800A devices are suited for applications that require convenient and economical updating of program, configuration, or data memory. For all system applications, they signifidf.dzsc.com

Fast Erase and Word-Program

- Sector-Erase Time: 18 ms (typical)
- Block-Erase Time: 18 ms (typical)
- Chip-Erase Time: 70 ms (typical)
- Word-Program Time: 14 µs (typical)
- Chip Rewrite Time: 2 seconds (typical) for SST39LF/VF200A 4 seconds (typical) for SST39LF/VF400A 8 seconds (typical) for SST39LF/VF800A
- Automatic Write Timing
 - Internal V_{PP} Generation
- End-of-Write Detection
- Toggle Bit
- Data# Polling
- CMOS I/O Compatibility
- JEDEC Standard
- Flash EEPROM Pinouts and command sets
- Packages Available
 - 48-lead TSOP (12mm x 20mm)
 - 48-ball TFBGA (6mm x 8mm)

cantly improve performance and reliability, while lowering power consumption. They inherently use less energy during Erase and Program than alternative flash technologies. When programming a flash device, the total energy consumed is a function of the applied voltage, current, and time of application. Since for any given voltage range, the SuperFlash technology uses less current to program and has a shorter erase time, the total energy consumed during any Erase or Program operation is less than alternative flash technologies. These devices also improve flexibility while lowering the cost for program, data, and configuration storage applications.

The SuperFlash technology provides fixed Erase and Program times, independent of the number of Erase/Program cycles that have occurred. Therefore the system software or hardware does not have to be modified or de-rated as is necessary with alternative flash technologies, whose Erase and Program times increase with accumulated Erase/Program cycles.

To meet surface mount requirements, the SST39LF200A/ 400A/800A and SST39VF200A/400A/800A are offered in both 48-lead TSOP packages and 48-ball TFBGA packages. See Figures 1 and 2 for pinouts.

Device Operation

Commands are used to initiate the memory operation functions of the device. Commands are written to the device using standard microprocessor write sequences. A command is written by asserting WE# low while keeping CE# low. The address bus is latched on the falling edge of WE# or CE#, whichever occurs last. The data bus is latched on the rising edge of WE# or CE#, whichever occurs first.

Read

The Read operation of the SST39LF200A/400A/800A and SST39VF200A/400A/800A is controlled by CE# and OE#, both have to be low for the system to obtain data from the outputs. CE# is used for device selection. When CE# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in high impedance state when either CE# or OE# is high. Refer to the Read cycle timing diagram for further details (Figure 3).

Word-Program Operation

The SST39LF200A/400A/800A and SST39VF200A/400A/ 800A are programmed on a word-by-word basis. Before programming, one must ensure that the sector, in which the word which is being programmed exists, is fully erased. The Program operation consists of three steps. The first step is the three-byte load sequence for Software Data Protection. The second step is to load word address and word data. During the Word-Program operation, the addresses are latched on the falling edge of either CE# or WE#, whichever occurs last. The data is latched on the rising edge of either CE# or WE#, whichever occurs first. The third step is the internal Program operation which is initiated after the rising edge of the fourth WE# or CE#, whichever occurs first. The Program operation, once initiated, will be completed within 20 µs. See Figures 4 and 5 for WE# and CE# controlled Program operation timing diagrams and Figure 16 for flowcharts. During the Program operation, the only valid reads are Data# Polling and Toggle Bit. During the internal Program operation, the host is free to perform additional tasks. Any commands issued during the internal Program operation are ignored.

Sector/Block-Erase Operation

The Sector- (or Block-) Erase operation allows the system to erase the device on a sector-by-sector (or block-byblock) basis. The SST39LF200A/400A/800A and SST39VF200A/400A/800A offers both Sector-Erase and Block-Erase mode. The sector architecture is based on uniform sector size of 2 KWord. The Block-Erase mode is based on uniform block size of 32 KWord. The Sector-

Data Sheet

Erase operation is initiated by executing a six-byte command sequence with Sector-Erase command (30H) and sector address (SA) in the last bus cycle. The Block-Erase operation is initiated by executing a six-byte command sequence with Block-Erase command (50H) and block address (BA) in the last bus cycle. The sector or block address is latched on the falling edge of the sixth WE# pulse, while the command (30H or 50H) is latched on the rising edge of the sixth WE# pulse. The internal Erase operation begins after the sixth WE# pulse. The End-of-Erase operation can be determined using either Data# Polling or Toggle Bit methods. See Figures 9 and 10 for timing waveforms. Any commands issued during the Sectoror Block-Erase operation are ignored.

Chip-Erase Operation

The SST39LF200A/400A/800A and SST39VF200A/400A/ 800A provide a Chip-Erase operation, which allows the user to erase the entire memory array to the "1" state. This is useful when the entire device must be quickly erased.

The Chip-Erase operation is initiated by executing a sixbyte command sequence with Chip-Erase command (10H) at address 5555H in the last byte sequence. The Erase operation begins with the rising edge of the sixth WE# or CE#, whichever occurs first. During the Erase operation, the only valid read is Toggle Bit or Data# Polling. See Table 4 for the command sequence, Figure 8 for timing diagram, and Figure 19 for the flowchart. Any commands issued during the Chip-Erase operation are ignored.

Write Operation Status Detection

The SST39LF200A/400A/800A and SST39VF200A/400A/ 800A provide two software means to detect the completion of a write (Program or Erase) cycle, in order to optimize the system write cycle time. The software detection includes two status bits: Data# Polling (DQ₇) and Toggle Bit (DQ₆). The End-of-Write detection mode is enabled after the rising edge of WE#, which initiates the internal Program or Erase operation.

The actual completion of the nonvolatile write is asynchronous with the system; therefore, either a Data# Polling or Toggle Bit read may be simultaneous with the completion of the write cycle. If this occurs, the system may possibly get an erroneous result, i.e., valid data may appear to conflict with either DQ₇ or DQ₆. In order to prevent spurious rejection, if an erroneous result occurs, the software routine should include a loop to read the accessed location an additional two (2) times. If both reads are valid, then the device has completed the write cycle, otherwise the rejection is valid.

Data Sheet

Data# Polling (DQ7)

When the SST39LF200A/400A/800A and SST39VF200A/ 400A/800A are in the internal Program operation, any attempt to read DQ_7 will produce the complement of the true data. Once the Program operation is completed, DQ_7 will produce true data. The device is then ready for the next operation. During internal Erase operation, any attempt to read DQ_7 will produce a '0'. Once the internal Erase operation is completed, DQ_7 will produce a '1'. The Data# Polling is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector-, Block- or Chip-Erase, the Data# Polling is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 6 for Data# Polling timing diagram and Figure 17 for a flowchart.

Toggle Bit (DQ₆)

During the internal Program or Erase operation, any consecutive attempts to read DQ_6 will produce alternating 1s and 0s, i.e., toggling between 1 and 0. When the internal Program or Erase operation is completed, the DQ_6 bit will stop toggling. The device is then ready for the next operation. The Toggle Bit is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector-, Block- or Chip-Erase, the Toggle Bit is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 7 for Toggle Bit timing diagram and Figure 17 for a flowchart.

Data Protection

The SST39LF200A/400A/800A and SST39VF200A/400A/ 800A provide both hardware and software features to protect nonvolatile data from inadvertent writes.

Hardware Data Protection

<u>Noise/Glitch Protection</u>: A WE# or CE# pulse of less than 5 ns will not initiate a write cycle.

 V_{DD} Power Up/Down Detection: The Write operation is inhibited when V_{DD} is less than 1.5V.

<u>Write Inhibit Mode</u>: Forcing OE# low, CE# high, or WE# high will inhibit the Write operation. This prevents inadvertent writes during power-up or power-down.

Software Data Protection (SDP)

The SST39LF200A/400A/800A and SST39VF200A/400A/ 800A provide the JEDEC approved Software Data Protection scheme for all data alteration operations, i.e., Program and Erase. Any Program operation requires the inclusion of the three-byte sequence. The three-byte load sequence is used to initiate the Program operation, providing optimal protection from inadvertent Write operations, e.g., during the system power-up or power-down. Any Erase operation requires the inclusion of six-byte sequence. This group of devices are shipped with the Software Data Protection permanently enabled. See Table 4 for the specific software command codes. During SDP command sequence, invalid commands will abort the device to Read mode within TRC. The contents of DQ_{15} - DQ_8 can be V_{IL} or V_{IH} , but no other value, during any SDP command sequence.

Common Flash Memory Interface (CFI)

The SST39LF200A/400A/800A and SST39VF200A/400A/ 800A also contain the CFI information to describe the characteristics of the device. In order to enter the CFI Query mode, the system must write three-byte sequence, same as Software ID Entry command with 98H (CFI Query command) to address 5555H in the last byte sequence. Once the device enters the CFI Query mode, the system can read CFI data at the addresses given in Tables 5 through 9. The system must write the CFI Exit command to return to Read mode from the CFI Query mode.

Data Sheet

Product Identification

The Product Identification mode identifies the devices as the SST39LF/VF200A, SST39LF/VF400A and SST39LF/ VF800A and manufacturer as SST. This mode may be accessed by software operations. Users may use the Software Product Identification operation to identify the part (i.e., using the device ID) when using multiple manufacturers in the same socket. For details, see Table 4 for software operation, Figure 11 for the Software ID Entry and Read timing diagram, and Figure 18 for the Software ID Entry command sequence flowchart.

 TABLE

T1.3 360

Product Identification Mode Exit/ CFI Mode Exit

In order to return to the standard Read mode, the Software Product Identification mode must be exited. Exit is accomplished by issuing the Software ID Exit command sequence, which returns the device to the Read mode. This command may also be used to reset the device to the Read mode after any inadvertent transient condition that apparently causes the device to behave abnormally, e.g., not read correctly. Please note that the Software ID Exit/ CFI Exit command is ignored during an internal Program or Erase operation. See Table 4 for software command codes, Figure 13 for timing waveform and Figure 18 for a flowchart.

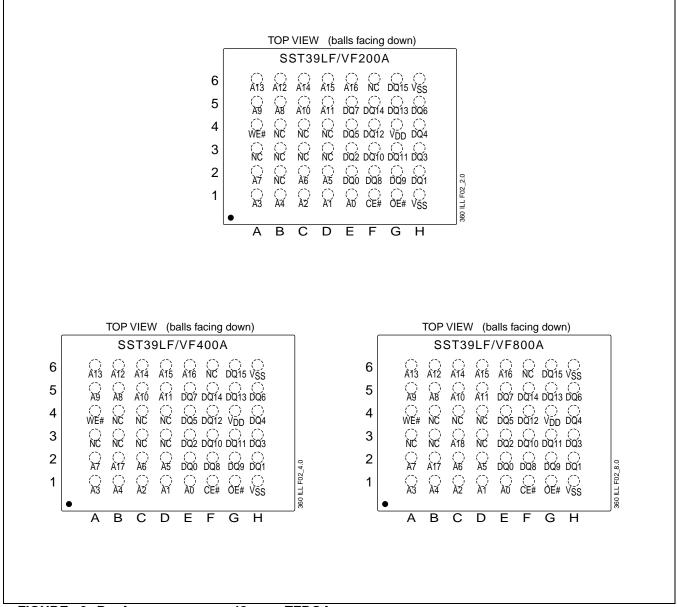

FIGURE 2: PIN ASSIGNMENTS FOR 48-BALL TFBGA

Data Sheet

TABLE 2: PIN DESCRIPTION

| Symbol | Pin Name | Functions | | | | |
|--|-------------------|--|---|--|--|--|
| A _{MS} ¹ -A ₀ | Address Inputs | To provide memory addresses. During Sector-Erase A _{MS} -A ₁₁ address lines will select the sector. During Block-Erase A _{MS} -A ₁₅ address lines will select the block. | | | | |
| DQ ₁₅ -DQ ₀ | Data Input/output | To output data during Read cycles and receive input data during Write cycles. Data is internally latched during a Write cycle. The outputs are in tri-state when OE# or CE# is high. | | | | |
| CE# | Chip Enable | To activate the device when CE# is low. | To activate the device when CE# is low. | | | |
| OE# | Output Enable | To gate the data output buffers. | | | | |
| WE# | Write Enable | To control the Write operations. | | | | |
| V_{DD} | Power Supply | To provide power supply voltage: 3.0-3.6V for SST39LF200A/400A/800A 2.7-3.6V for SST39VF200A/400A/800A | | | | |
| V _{SS} | Ground | | | | | |

Data Sheet

Absolute Maximum Stress Ratings (Applied conditions greater than those listed under "Absolute Maximum Stress Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions or conditions greater than those defined in the operational sections of this data sheet is not implied. Exposure to absolute maximum stress rating conditions may affect device reliability.)

| Temperature Under Bias | |
|--|--------------------------------|
| Storage Temperature | |
| D. C. Voltage on Any Pin to Ground Potential | 0.5V to V _{DD} + 0.5V |
| Transient Voltage (<20 ns) on Any Pin to Ground Potential | 1.0V to V _{DD} + 1.0V |
| Voltage on A_9 Pin to Ground Potential | |
| Package Power Dissipation Capability (Ta = 25°C) | 1.0W |
| Surface Mount Lead Soldering Temperature (3 Seconds) | 240°C |
| Output Short Circuit Current ¹ | 50 mA |
| 1. Outputs shorted for no more than one second. No more than one output shorted at a time. | |

OPERATING RANGE: SST39LF200A/400A/800A

| Range | Ambient Temp | V _{DD} |
|------------|--------------|-----------------|
| Commercial | 0°C to +70°C | 3.0-3.6V |

OPERATING RANGE: SST39VF200A/400A/800A

| Range | Ambient Temp | V _{DD} |
|------------|----------------|-----------------|
| Commercial | 0°C to +70°C | 2.7-3.6V |
| Extended | -20°C to +85°C | 2.7-3.6V |
| Industrial | -40°C to +85°C | 2.7-3.6V |

AC CONDITIONS OF TEST

| Input Rise/Fall Time 5 ns |
