

M27C320

32 Mbit (4Mb x8 or 2Mb x16) OTP EPROM

PRELIMINARY DATA

- 5V \pm 10% SUPPLY VOLTAGE in READ OPERATION
- FAST ACCESS TIME: 80ns
- BYTE-WIDE or WORD-WIDE CONFIGURABLE
- 32 Mbit MASK ROM REPLACEMENT
- LOW POWER CONSUMPTION
 - Active Current 70mA at 8MHz
 - Stand-by Current 100mA
- PROGRAMMING VOLTAGE: 12V \pm 0.25V
- PROGRAMMING TIME: 100 μ s/byte (typical)(PRESTO III Algorithm)
- ELECTRONIC SIGNATURE:
 - Manufacturer Code 0020h
 - Device Code: 0032h

DESCRIPTION

The M27C320 is a 32 Mbit EPROM offered in the OTP range (one time programmable). It is ideally suited for microprocessor systems requiring large data or program storage. It is organised as either 4 MWords of 8 bit or 2 MWords of 16 bit. The pin-out is compatible with the 32 Mbit Mask ROM.

The M27C320 is offered in TSOP48 (12 x 20mm) and SO44 packages.

Table 1. Signal Names

A0-A20	Address Inputs
Q0-Q7	Data Outputs
Q8-Q14	Data Outputs
Q15A-1	Data Output / Address Input
\bar{E}	Chip Enable
$\bar{G}V_{PP}$	Output Enable / Program Supply
BYTE	Byte-Wide Select
V _{CC}	Supply Voltage
V _{SS}	Ground

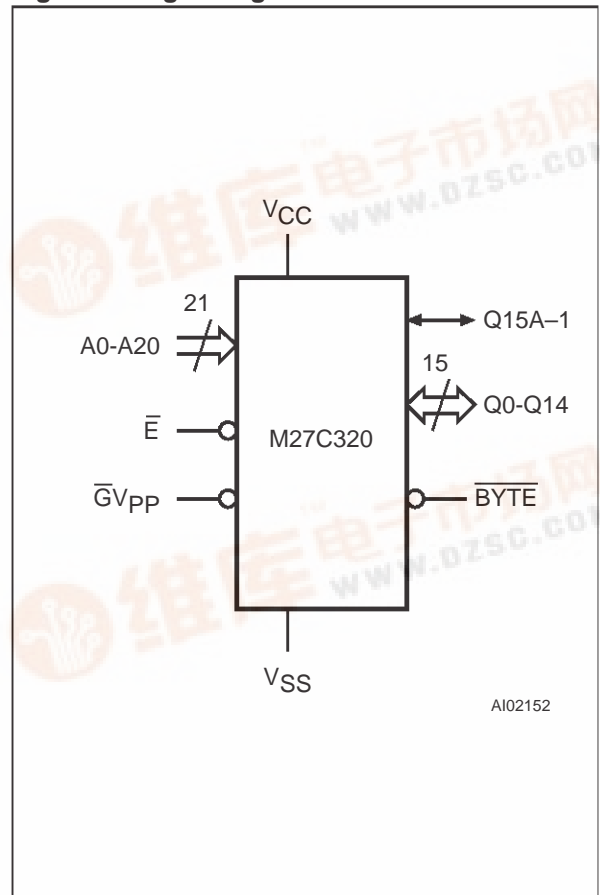

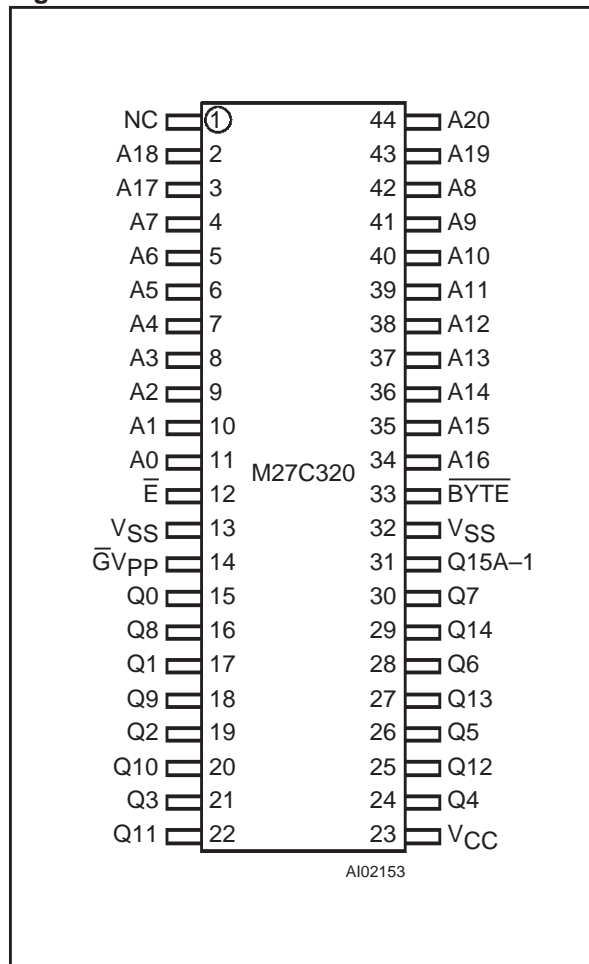

Figure 1. Logic Diagram

M27C320

Warning: NC = Not Connected.

Figure 2B. TSOP Pin Connections

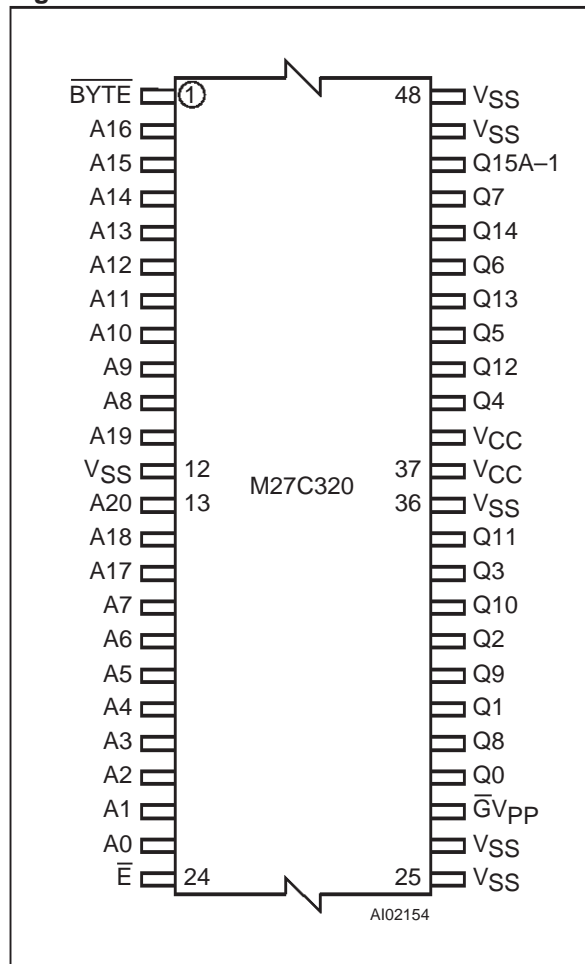

Table 2. Absolute Maximum Ratings ⁽¹⁾

Symbol	Parameter	Value	Unit
T _A	Ambient Operating Temperature ⁽³⁾	−40 to 125	°C
T _{BIAS}	Temperature Under Bias	−50 to 125	°C
T _{STG}	Storage Temperature	−65 to 150	°C
V _{IO} ⁽²⁾	Input or Output Voltage (except A9)	−2 to 7	V
V _{CC}	Supply Voltage	−2 to 7	V
V _{A9} ⁽²⁾	A9 Voltage	−2 to 13.5	V
V _{PP}	Program Supply Voltage	−2 to 14	V

Note: 1. Except for the rating "Operating Temperature Range", stresses above those listed in the Table "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

2. Minimum DC voltage on Input or Output is $-0.5V$ with possible undershoot to $-2.0V$ for a period less than 20ns. Maximum DC voltage on Output is $V_{CC} + 0.5V$ with possible overshoot to $V_{CC} + 2V$ for a period less than 20ns.

3. Depends on range.

Table 3. Operating Modes

Mode	\overline{E}	$\overline{GV_{PP}}$	\overline{BYTE}	A9	Q0-Q7	Q8-Q14	Q15A-1
Read Word-wide	V_{IL}	V_{IL}	V_{IH}	X	Data Out	Data Out	Data Out
Read Byte-wide Upper	V_{IL}	V_{IL}	V_{IL}	X	Data Out	Hi-Z	V_{IH}
Read Byte-wide Lower	V_{IL}	V_{IL}	V_{IL}	X	Data Out	Hi-Z	V_{IL}
Output Disable	V_{IL}	V_{IH}	X	X	Hi-Z	Hi-Z	Hi-Z
Program	V_{IL} Pulse	V_{PP}	V_{IH}	X	Data In	Data In	Data In
Program Inhibit	V_{IH}	V_{PP}	V_{IH}	X	Hi-Z	Hi-Z	Hi-Z
Standby	V_{IH}	X	X	X	Hi-Z	Hi-Z	Hi-Z
Electronic Signature	V_{IL}	V_{IL}	V_{IH}	V_{ID}	Codes	Codes	Code

Note: X = V_{IH} or V_{IL} , $V_{ID} = 12V \pm 0.5V$.

Table 4. Electronic Signature

Identifier	A0	Q7	Q6	Q5	Q4	Q3	Q2	Q1	Q0	Hex Data
Manufacturer's Code	V_{IL}	0	0	1	0	0	0	0	0	20h
Device Code	V_{IH}	0	0	1	1	0	0	1	0	32h

Note: Outputs Q8-Q15 are set to '0'.

DEVICE OPERATION

The operating modes of the M27C320 are listed in the Operating Modes Table. A single power supply is required in the read mode. All inputs are TTL compatible except for V_{PP} and 12V on A9 for the Electronic Signature.

Read Mode

The M27C320 has two organisations, Word-wide and Byte-wide. The organisation is selected by the signal level on the \overline{BYTE} pin. When \overline{BYTE} is at V_{IH} the Word-wide organisation is selected and the Q15A-1 pin is used for Q15 Data Output. When the \overline{BYTE} pin is at V_{IL} the Byte-wide organisation is selected and the Q15A-1 pin is used for the Address Input A-1. When the memory is logically regarded as 16 bit wide, but read in the Byte-wide organisation, then with A-1 at V_{IL} the lower 8 bits of the 16 bit data are selected and with A-1 at V_{IH} the upper 8 bits of the 16 bit data are selected.

The M27C320 has two control functions, both of which must be logically active in order to obtain data at the outputs. In addition the Word-wide or Byte-wide organisation must be selected.

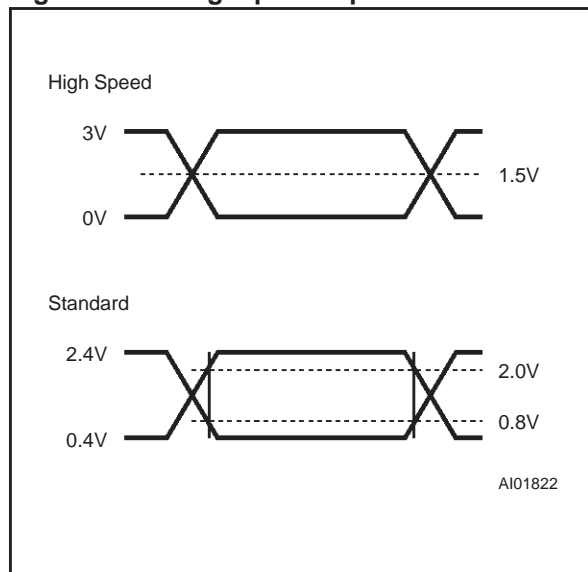

Chip Enable (\overline{E}) is the power control and should be used for device selection. Output Enable (\overline{G}) is the output control and should be used to gate data to the output pins independent of device selection. Assuming that the addresses are stable, the address access time (t_{AVQV}) is equal to the delay from \overline{E} to output (t_{ELQV}). Data is available at the output after a delay of t_{GLQV} from the falling edge of \overline{G} , assuming that \overline{E} has been low and the addresses have been stable for at least $t_{AVQV} - t_{GLQV}$.

Standby Mode

The M27C320 has standby mode which reduces the supply current from 50mA to 100 μ A. The M27C320 is placed in the standby mode by applying a CMOS high signal to the \overline{E} input. When in the standby mode, the outputs are in a high impedance state, independent of the \overline{G} input.

Table 5. AC Measurement Conditions

	High Speed	Standard
Input Rise and Fall Times	$\leq 10\text{ns}$	$\leq 20\text{ns}$
Input Pulse Voltages	0 to 3V	0.4V to 2.4V
Input and Output Timing Ref. Voltages	1.5V	0.8V and 2V

Figure 3. Testing Input Output Waveform**Figure 4. AC Testing Load Circuit****Table 6. Capacitance ⁽¹⁾** ($T_A = 25\text{ }^\circ\text{C}$, $f = 1\text{ MHz}$)

Symbol	Parameter	Test Condition	Min	Max	Unit
C_{IN}	Input Capacitance	$V_{IN} = 0\text{V}$		10	pF
C_{OUT}	Output Capacitance	$V_{OUT} = 0\text{V}$		12	pF

Note: 1. Sampled only, not 100% tested.

Two Line Output Control

Because EPROMs are usually used in larger memory arrays, this product features a 2 line control function which accommodates the use of multiple memory connection. The two line control function allows:

- the lowest possible memory power dissipation,
- complete assurance that output bus contention will not occur.

For the most efficient use of these two control lines, \overline{E} should be decoded and used as the primary device selecting function, while \overline{G} should be made a common connection to all devices in the array and connected to the $\overline{\text{READ}}$ line from the system control bus. This ensures that all deselected memory devices are in their low power standby mode and that the output pins are only active when data is required from a particular memory device.

Table 7. Read Mode DC Characteristics ⁽¹⁾
 $(T_A = 0 \text{ to } 70^\circ\text{C}; V_{CC} = 5V \pm 10\%)$

Symbol	Parameter	Test Condition	Min	Max	Unit
I_{LI}	Input Leakage Current	$0V \leq V_{IN} \leq V_{CC}$		± 1	μA
I_{LO}	Output Leakage Current	$0V \leq V_{OUT} \leq V_{CC}$		± 10	μA
I_{CC}	Supply Current	$\bar{E} = V_{IL}, \bar{G} = V_{IL}, I_{OUT} = 0mA, f = 8MHz$		70	mA
		$\bar{E} = V_{IL}, \bar{G} = V_{IL}, I_{OUT} = 0mA, f = 5MHz$		50	mA
I_{CC1}	Supply Current (Standby) TTL	$\bar{E} = V_{IH}$		1	mA
I_{CC2}	Supply Current (Standby) CMOS	$\bar{E} > V_{CC} - 0.2V$		100	μA
I_{PP}	Program Current	$V_{PP} = V_{CC}$		10	μA
V_{IL}	Input Low Voltage		-0.3	0.8	V
$V_{IH}^{(2)}$	Input High Voltage		2	$V_{CC} + 1$	V
V_{OL}	Output Low Voltage	$I_{OL} = 2.1mA$		0.4	V
V_{OH}	Output High Voltage TTL	$I_{OH} = -400\mu A$	2.4		V

Note: 1. V_{CC} must be applied simultaneously with or before V_{PP} and removed simultaneously or after V_{PP} .

2. Maximum DC voltage on Output is $V_{CC} + 0.5V$.

System Considerations

The power switching characteristics of Advanced CMOS EPROMs require careful decoupling of the supplies to the devices. The supply current I_{CC} has three segments of importance to the system designer: the standby current, the active current and the transient peaks that are produced by the falling and rising edges of \bar{E} .

The magnitude of the transient current peaks is dependant on the capacititive and inductive loading of the device outputs. The associated transient voltage peaks can be suppressed by complying with the two line output control and by properly selected decoupling capacitors. It is recommended that a $0.1\mu F$ ceramic capacitor is used on every device between V_{CC} and V_{SS} . This should be a high frequency type of low inherent inductance and should be placed as close as possible to the device. In addition, a $4.7\mu F$ electrolytic capacitor

should be used between V_{CC} and V_{SS} for every eight devices. This capacitor should be mounted near the power supply connection point. The purpose of this capacitor is to overcome the voltage drop caused by the inductive effects of PCB traces.

Programming

When delivered, all bits of the M27C320 are in the '1' state. Data is introduced by selectively programming '0's into the desired bit locations. Although only '0's will be programmed, both '1's and '0's can be present in the data word. The M27C320 is in the programming mode when V_{PP} input is at 12.5V, \bar{G} is at V_{IH} and \bar{E} is pulsed to V_{IL} . The data to be programmed is applied to 16 bits in parallel to the data output pins. The levels required for the address and data inputs are TTL. V_{CC} is specified to be $6.25V \pm 0.25V$.

Figure 10. Programming Flowchart

PRESTO III Programming Algorithm

The PRESTO III Programming Algorithm allows the whole array to be programmed with a guaranteed margin in a typical time of 100 seconds. Programming with PRESTO III consists of applying a sequence of 50µs program pulses to each word until a correct verify occurs (see Figure 10). During programming and verify operation a MARGIN MODE circuit is automatically activated to guarantee that each cell is programmed with enough margin. No overprogram pulse is applied since the verify in MARGIN MODE provides the necessary margin to each programmed cell.

Program Inhibit

Programming of multiple M27C320s in parallel with different data is also easily accomplished. Except for \bar{E} , all like inputs including \bar{G} of the parallel M27C320 may be common. A TTL low level pulse applied to a M27C320's \bar{E} input and V_{PP} at 12V, will program that M27C320. A high level \bar{E} input inhibits the other M27C320s from being programmed.

Program Verify

A verify (read) should be performed on the programmed bits to determine that they were correctly programmed. The verify is accomplished with \bar{G} at V_{IL}. Data should be verified with t_{ELQV} after the falling edge of \bar{E} .

On-Board Programming

The M27C320 can be directly programmed in the application circuit. See the relevant Application Note AN620.

Electronic Signature

The Electronic Signature (ES) mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and type. This mode is intended for use by programming equipment to automatically match the device to be programmed with its corresponding programming algorithm. The ES mode is functional in the $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ ambient temperature range that is required when pro-

gramming the M27C320. To activate the ES mode, the programming equipment must force 11.5V to 12.5V on address line A9 of the M27C320, with $V_{PP}=V_{CC}=5\text{V}$. Two identifier bytes may then be sequenced from the device outputs by toggling address line A0 from V_{IL} to V_{IH} . All other address lines must be held at V_{IL} during Electronic Signature mode.

Byte 0 ($A0=V_{IL}$) represents the manufacturer code and byte 1 ($A0=V_{IH}$) the device identifier code. For the STMicroelectronics M27C320, these two identifier bytes are given in Table 4 and can be read-out on outputs Q0 to Q7.
