

4-Bit D Flip-Flop

The MC10E/100E131 is a quad master-slave D-type flip-flop with differential outputs. Each flip-flop may be clocked separately by holding Common Clock ($\overline{C_C}$) LOW and using the Clock Enable ($\overline{C_E}$) inputs for clocking. Common clocking is achieved by holding the $\overline{C_E}$ inputs LOW and using $\overline{C_C}$ to clock all four flip-flops. In this case, the $\overline{C_E}$ inputs perform the function of controlling the common clock, to each flip-flop.

Individual asynchronous resets are provided (R). Asynchronous set controls (S) are ganged together in pairs, with the pairing chosen to reflect physical chip symmetry.

Data enters the master when both $\overline{C_C}$ and $\overline{C_E}$ are LOW, and transfers to the slave when either $\overline{C_C}$ or $\overline{C_E}$ (or both) go HIGH.
