

### 18-pin Enhanced Flash/EEPROM 8-Bit Microcontroller

### **Devices Included in this Data Sheet:**

- PIC16F84A
- Extended voltage range device available (PIC16LF84A)

### **High Performance RISC CPU Features:**

- Only 35 single word instructions to learn
- All instructions single cycle except for program branches which are two-cycle
- · Operating speed: DC 20 MHz clock input DC - 200 ns instruction cycle
- · 1024 words of program memory
- · 68 bytes of data RAM
- · 64 bytes of data EEPROM
- 14-bit wide instruction words
- 8-bit wide data bytes
- 15 special function hardware registers
- Eight-level deep hardware stack
- Direct, indirect and relative addressing modes
- Four interrupt sources:
  - External RB0/INT pin
  - TMR0 timer overflow
  - PORTB<7:4> interrupt on change
  - Data EEPROM write complete

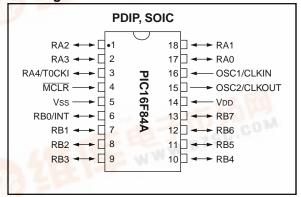

### **Peripheral Features:**

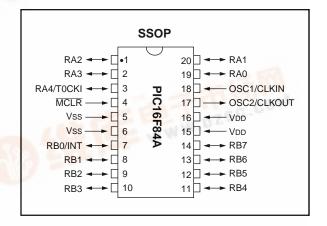

- 13 I/O pins with individual direction control
- High current sink/source for direct LED drive
  - 25 mA sink max. per pin
  - 25 mA source max. per pin
- TMR0: 8-bit timer/counter with 8-bit programmable prescaler

### Special Microcontroller Features:

- 1000 erase/write cycles Enhanced Flash program memory
- 1,000,000 typical erase/write cycles EEPROM data memory
- EEPROM Data Retention > 40 years
- In-Circuit Serial Programming (ICSP™) via two
- Power-on Reset (POR), Power-up Timer (PWRT), Oscillator Start-up Timer (OST)
- Watchdog Timer (WDT) with its own on-chip RC oscillator for reliable operation
- Code-protection
- Power saving SLEEP mode
- Selectable oscillator options

### **Pin Diagrams**

### CMOS Enhanced Flash/EERPOM Technology:

- · Low-power, high-speed technology
- Wide operating voltage range:
   Commercial: 0.000
  - Commercial: 2.0V to 5.5V
  - Industrial: 2.0V to 5.5V
- Low power consumption:
  - < 2 mA typical @ 5V, 4 MHz</li>
  - 15 μA typical @ 2V, 32 kHz
  - < 0.5 μA typical standby current @ 2V

### To Our Valued Customers

### **Most Current Data Sheet**

To obtain the most up-to-date version of this data sheet, please check our Worldwide Web site at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number. e.g., DS30000A is version A of document DS30000.

#### Errata

An errata sheet may exist for current devices, describing minor operational differences (from the data sheet) and recommended workarounds. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; http://www.microchip.com
- Your local Microchip sales office (see last page)
- The Microchip Corporate Literature Center; U.S. FAX: (602) 786-7277

When contacting a sales office or the literature center, please specify which device, revision of silicon and data sheet (include literature number) you are using.

### **Corrections to this Data Sheet**

We constantly strive to improve the quality of all our products and documentation. We have spent a great deal of time to ensure that this document is correct. However, we realize that we may have missed a few things. If you find any information that is missing or appears in error, please:

- Fill out and mail in the reader response form in the back of this data sheet.
- E-mail us at webmaster@microchip.com.

We appreciate your assistance in making this a better document.

11

### 1.0 DEVICE OVERVIEW

This document contains device-specific information for the operation of the PIC16F84A device. Additional information may be found in the PICmicro™ Mid-Range Reference Manual, (DS33023), which may be downloaded from the Microchip website. The Reference Manual should be considered a complementary document to this data sheet, and is highly recommended reading for a better understanding of the device architecture and operation of the peripheral modules.

The PIC16F84A belongs to the mid-range family of the PICmicro™ microcontroller devices. A block diagram of the device is shown in Figure 1-1.

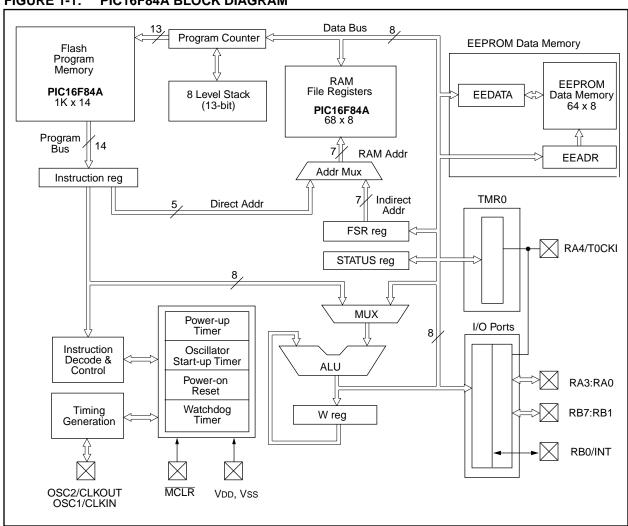

The program memory contains 1K words, which translates to 1024 instructions, since each 14-bit program memory word is the same width as each device instruction. The data memory (RAM) contains 68 bytes. Data EEPROM is 64 bytes.

There are also 13 I/O pins that are user-configured on a pin-to-pin basis. Some pins are multiplexed with other device functions. These functions include:

- · External interrupt
- Change on PORTB interrupt
- Timer0 clock input

Table 1-1 details the pinout of the device with descriptions and details for each pin.

FIGURE 1-1: PIC16F84A BLOCK DIAGRAM

Legend: I= input

O = output — = Not used I/O = Input/Output

P = power

TTL = TTL input ST = Schmitt Trigger input

Note 1: This buffer is a Schmitt Trigger input when configured as the external interrupt.

This buffer is a Schmitt Trigger input when used in serial programming mode.
 This buffer is a Schmitt Trigger input when configured in RC oscillator mode and a CMOS input otherwise.

### 2.0 MEMORY ORGANIZATION

There are two memory blocks in the PIC16F84A. These are the program memory and the data memory. Each block has its own bus, so that access to each block can occur during the same oscillator cycle.

The data memory can further be broken down into the general purpose RAM and the Special Function Registers (SFRs). The operation of the SFRs that control the "core" are described here. The SFRs used to control the peripheral modules are described in the section discussing each individual peripheral module.

The data memory area also contains the data EEPROM memory. This memory is not directly mapped into the data memory, but is indirectly mapped. That is, an indirect address pointer specifies the address of the data EEPROM memory to read/write. The 64 bytes of data EEPROM memory have the address range 0h-3Fh. More details on the EEPROM memory can be found in Section 5.0.

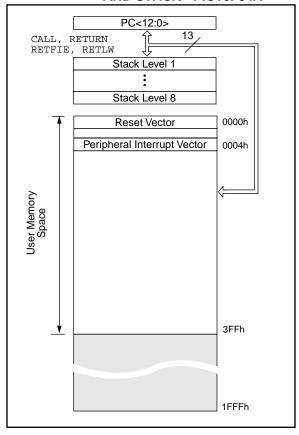

Additional information on device memory may be found in the PICmicro<sup>™</sup> Mid-Range Reference Manual, (DS33023).

### 2.1 <u>Program Memory Organization</u>

The PIC16FXX has a 13-bit program counter capable of addressing an 8K x 14 program memory space. For the PIC16F84A, the first 1K x 14 (0000h-03FFh) are physically implemented (Figure 2-1). Accessing a location above the physically implemented address will cause a wraparound. For example, for locations 20h, 420h, 820h, C20h, 1020h, 1420h, 1820h, and 1C20h will be the same instruction.

The reset vector is at 0000h and the interrupt vector is at 0004h.

FIGURE 2-1: PROGRAM MEMORY MAP AND STACK - PIC16F84A

### 2.2 <u>Data Memory Organization</u>

The data memory is partitioned into two areas. The first is the Special Function Registers (SFR) area, while the second is the General Purpose Registers (GPR) area. The SFRs control the operation of the device.

Portions of data memory are banked. This is for both the SFR area and the GPR area. The GPR area is banked to allow greater than 116 bytes of general purpose RAM. The banked areas of the SFR are for the registers that control the peripheral functions. Banking requires the use of control bits for bank selection. These control bits are located in the STATUS Register. Figure 2-1 shows the data memory map organization.

Instructions MOVWF and MOVF can move values from the W register to any location in the register file ("F"), and vice-versa.

The entire data memory can be accessed either directly using the absolute address of each register file or indirectly through the File Select Register (FSR) (Section 2.4). Indirect addressing uses the present value of the RP0 bit for access into the banked areas of data memory.

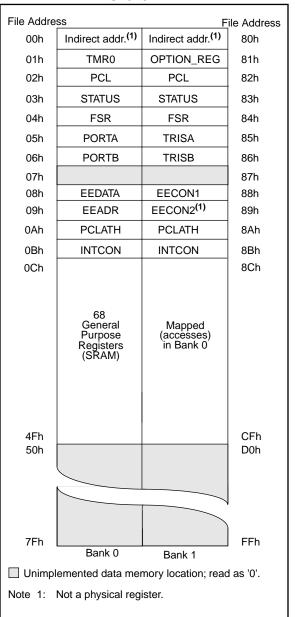

Data memory is partitioned into two banks which contain the general purpose registers and the special function registers. Bank 0 is selected by clearing the RP0 bit (STATUS<5>). Setting the RP0 bit selects Bank 1. Each Bank extends up to 7Fh (128 bytes). The first twelve locations of each Bank are reserved for the Special Function Registers. The remainder are General Purpose Registers implemented as static RAM.

#### 2.2.1 GENERAL PURPOSE REGISTER FILE

Each General Purpose Register (GPR) is 8 bits wide and is accessed either directly or indirectly through the FSR (Section 2.4).

The GPR addresses in bank 1 are mapped to addresses in bank 0. As an example, addressing location 0Ch or 8Ch will access the same GPR.

FIGURE 2-1: REGISTER FILE MAP - PIC16F84A

### 2.2.2 SPECIAL FUNCTION REGISTERS

The Special Function Registers (Figure 2-1 and Table 2-1) are used by the CPU and Peripheral functions to control the device operation. These registers are static RAM.

The special function registers can be classified into two sets, core and peripheral. Those associated with the core functions are described in this section. Those related to the operation of the peripheral features are described in the section for that specific feature.

### TABLE 2-1 REGISTER FILE SUMMARY

| Addr   | Name       | Bit 7                                               | Bit 6                                 | Bit 5       | Bit 4            | Bit 3         | Bit 2         | Bit 1 | Bit 0     | Value on<br>Power-on<br>Reset | Value on all other resets (Note3) |

 $\label{eq:local_equation} \textbf{Legend:} \quad \textbf{x} = \textbf{unknown}, \ \textbf{u} = \textbf{unchanged.} \ \textbf{-} = \textbf{unimplemented read as '0'}, \ \textbf{q} = \textbf{value depends on condition}.$ 

- Note 1: The upper byte of the program counter is not directly accessible. PCLATH is a slave register for PC<12:8>. The contents of PCLATH can be transferred to the upper byte of the program counter, but the contents of PC<12:8> is never transferred to PCLATH.
  - 2: The TO and PD status bits in the STATUS register are not affected by a MCLR reset.
  - 3: Other (non power-up) resets include: external reset through  $\overline{\text{MCLR}}$  and the Watchdog Timer Reset.
  - 4: On any device reset, these pins are configured as inputs.
  - 5: This is the value that will be in the port output latch.

#### 2.2.2.1 STATUS REGISTER

The STATUS register contains the arithmetic status of the ALU, the RESET status and the bank select bit for data memory.

As with any register, the STATUS register can be the destination for any instruction. If the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to device logic. Furthermore, the  $\overline{\text{TO}}$  and  $\overline{\text{PD}}$  bits are not writable. Therefore, the result of an instruction with the STATUS register as destination may be different than intended.

For example, CLRF STATUS will clear the upper-three bits and set the Z bit. This leaves the STATUS register as 000u uluu (where u = unchanged).

Only the BCF, BSF, SWAPF and MOVWF instructions should be used to alter the STATUS register (Table 7-2) because these instructions do not affect any status bit.

- Note 1: The IRP and RP1 bits (STATUS<7:6>) are not used by the PIC16F84A and should be programmed as cleared. Use of these bits as general purpose R/W bits is NOT recommended, since this may affect upward compatibility with future products.
- Note 2: The C and DC bits operate as a borrow and digit borrow out bit, respectively, in subtraction. See the SUBLW and SUBWF instructions for examples.
- Note 3: When the STATUS register is the destination for an instruction that affects the Z, DC or C bits, then the write to these three bits is disabled. The specified bit(s) will be updated according to device logic

D 1:

#### OPTION\_REG REGISTER 2.2.2.2

The OPTION\_REG register is a readable and writable register which contains various control bits to configure the TMR0/WDT prescaler, the external INT interrupt, TMR0, and the weak pull-ups on PORTB.

Note: When the prescaler is assigned to the WDT (PSA = '1'), TMR0 has a 1:1 prescaler assignment.

### FIGURE 2-1: OPTION\_REG REGISTER (ADDRESS 81h)

### 2.2.2.3 INTCON REGISTER

The INTCON register is a readable and writable register which contains the various enable bits for all interrupt sources.

**Note:** Interrupt flag bits get set when an interrupt condition occurs regardless of the state of its corresponding enable bit or the global enable bit, GIE (INTCON<7>).

### 2.3 PCL and PCLATH

The program counter (PC) specifies the address of the instruction to fetch for execution. The PC is 13 bits wide. The low byte is called the PCL register. This register is readable and writable. The high byte is called the PCH register. This register contains the PC<12:8> bits and is not directly readable or writable. All updates to the PCH register go through the PCLATH register.

### 2.3.1 STACK

The stack allows a combination of up to 8 program calls and interrupts to occur. The stack contains the return address from this branch in program execution.

Midrange devices have an 8 level deep x 13-bit wide hardware stack. The stack space is not part of either program or data space and the stack pointer is not readable or writable. The PC is PUSHed onto the stack when a CALL instruction is executed or an interrupt causes a branch. The stack is POPed in the event of a RETURN, RETLW or a RETFIE instruction execution. PCLATH is not modified when the stack is PUSHed or POPed.

After the stack has been PUSHed eight times, the ninth push overwrites the value that was stored from the first push. The tenth push overwrites the second push (and so on).

### 2.4 <u>Indirect Addressing; INDF and FSR</u> <u>Registers</u>

The INDF register is not a physical register. Addressing INDF actually addresses the register whose address is contained in the FSR register (FSR is a *pointer*). This is indirect addressing.

### **EXAMPLE 2-1: INDIRECT ADDRESSING**

- · Register file 05 contains the value 10h
- Register file 06 contains the value 0Ah
- · Load the value 05 into the FSR register
- A read of the INDF register will return the value of 10h
- Increment the value of the FSR register by one (FSR = 06)
- A read of the INDF register now will return the value of 0Ah.

Reading INDF itself indirectly (FSR = 0) will produce 00h. Writing to the INDF register indirectly results in a no-operation (although STATUS bits may be affected).

A simple program to clear RAM locations 20h-2Fh using indirect addressing is shown in Example 2-2.

# EXAMPLE 2-2: HOW TO CLEAR RAM USING INDIRECT ADDRESSING

```
movlw 0x20 ;initialize pointer
movwf FSR ; to RAM

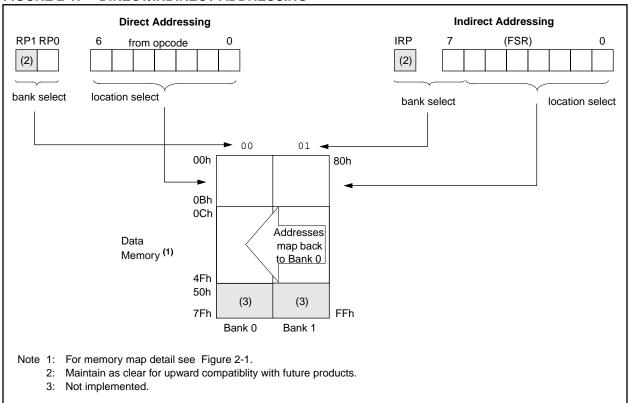

NEXT clrf INDF ;clear INDF register
incf FSR ;inc pointer
btfss FSR,4 ;all done?
goto NEXT ;NO, clear next

CONTINUE
: ;YES, continue
```

An effective 9-bit address is obtained by concatenating the 8-bit FSR register and the IRP bit (STATUS<7>), as shown in Figure 2-1. However, IRP is not used in the PIC16F84A.

. ...

FIGURE 2-1: DIRECT/INDIRECT ADDRESSING

### 3.0 **I/O PORTS**

Some pins for these I/O ports are multiplexed with an alternate function for the peripheral features on the device. In general, when a peripheral is enabled, that pin may not be used as a general purpose I/O pin.

Additional information on I/O ports may be found in the PICmicro™ Mid-Range Reference Manual, (DS33023).

### 3.1 PORTA and TRISA Registers

PORTA is a 5-bit wide bi-directional port. The corresponding data direction register is TRISA. Setting a TRISA bit (=1) will make the corresponding PORTA pin an input, i.e., put the corresponding output driver in a hi-impedance mode. Clearing a TRISA bit (=0) will make the corresponding PORTA pin an output, i.e., put the contents of the output latch on the selected pin.

**Note:** On a Power-on Reset, these pins are configured as inputs and read as '0'.

Reading the PORTA register reads the status of the pins whereas writing to it will write to the port latch. All write operations are read-modify-write operations. Therefore a write to a port implies that the port pins are read, this value is modified, and then written to the port data latch.

Pin RA4 is multiplexed with the Timer0 module clock input to become the RA4/T0CKI pin. The RA4/T0CKI pin is a Schmitt Trigger input and an open drain output. All other RA port pins have TTL input levels and full CMOS output drivers.

### **EXAMPLE 3-1: INITIALIZING PORTA**

### 3.2 PORTB and TRISB Registers

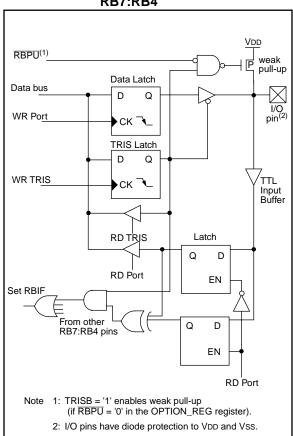

PORTB is an 8-bit wide bi-directional port. The corresponding data direction register is TRISB. Setting a TRISB bit (=1) will make the corresponding PORTB pin an input, i.e., put the corresponding output driver in a hi-impedance mode. Clearing a TRISB bit (=0) will make the corresponding PORTB pin an output, i.e., put the contents of the output latch on the selected pin.

### **EXAMPLE 3-1: INITIALIZING PORTB**

| BCF   | STATUS, | RPO ; |                       |
|-------|---------|-------|-----------------------|
| CLRF  | PORTB   | ;     | Initialize PORTB by   |
|       |         | ;     | clearing output       |
|       |         | ;     | data latches          |
| BSF   | STATUS, | RPO ; | Select Bank 1         |
| MOVLW | 0xCF    | ;     | Value used to         |
|       |         | ;     | initialize data       |
|       |         | ;     | direction             |
| MOVWF | TRISB   | ;     | Set RB<3:0> as inputs |
|       |         | ;     | RB<5:4> as outputs    |
|       |         | ;     | RB<7:6> as inputs     |

Each of the PORTB pins has a weak internal pull-up. A single control bit can turn on all the pull-ups. This is performed by clearing bit  $\overline{\text{RBPU}}$  (OPTION<7>). The weak pull-up is automatically turned off when the port pin is configured as an output. The pull-ups are disabled on a Power-on Reset.

FIGURE 3-3: BLOCK DIAGRAM OF PINS RB7:RB4

Four of PORTB's pins, RB7:RB4, have an interrupt on change feature. Only pins configured as inputs can cause this interrupt to occur (i.e. any RB7:RB4 pin configured as an output is excluded from the interrupt on change comparison). The input pins (of RB7:RB4) are compared with the old value latched on the last read of PORTB. The "mismatch" outputs of RB7:RB4 are OR'ed together to generate the RB Port Change Interrupt with flag bit RBIF (INTCON<0>).

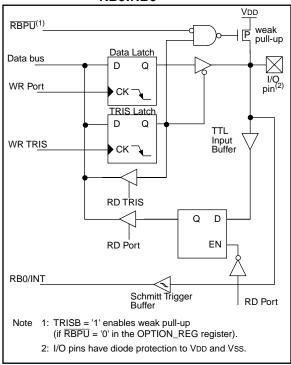

This interrupt can wake the device from SLEEP. The user, in the interrupt service routine, can clear the interrupt in the following manner:

- a) Any read or write of PORTB. This will end the mismatch condition.
- b) Clear flag bit RBIF.

A mismatch condition will continue to set flag bit RBIF. Reading PORTB will end the mismatch condition, and allow flag bit RBIF to be cleared.

The interrupt on change feature is recommended for wake-up on key depression operation and operations where PORTB is only used for the interrupt on change feature. Polling of PORTB is not recommended while using the interrupt on change feature.

#### **TIMERO MODULE** 4.0

The Timer0 module timer/counter has the following fea-

- 8-bit timer/counter
- · Readable and writable
- · Internal or external clock select
- Edge select for external clock
- · 8-bit software programmable prescaler
- · Interrupt on overflow from FFh to 00h

Figure 4-1 is a simplified block diagram of the Timer0 module.

Additional information on timer modules is available in the PICmicro™ Mid-Range Reference Manual. (DS33023).

#### 4.1 **Timer0 Operation**

Timer0 can operate as a timer or as a counter.

Timer mode is selected by clearing bit T0CS (OPTION REG<5>). In timer mode, the Timer0 module will increment every instruction cycle (without prescaler). If the TMR0 register is written, the increment is inhibited for the following two instruction cycles. The user can work around this by writing an adjusted value to the TMR0 register.

Counter mode is selected by setting bit T0CS (OPTION\_REG<5>). In counter mode, Timer0 will increment either on every rising or falling edge of pin RA4/T0CKI. The incrementing edge is determined by the Timer0 Source Edge Select bit T0SE (OPTION\_REG<4>). Clearing bit T0SE selects the rising edge. Restrictions on the external clock input are discussed below.

When an external clock input is used for Timer0, it must meet certain requirements. The requirements ensure the external clock can be synchronized with the internal phase clock (Tosc). Also, there is a delay in the actual incrementing of Timer0 after synchronization.

Additional information on external clock requirements is available in the PICmicro™ Mid-Range Reference Manual, (DS33023).

#### 4.2 **Prescaler**

An 8-bit counter is available as a prescaler for the Timer0 module, or as a postscaler for the Watchdog Timer, respectively (Figure 4-2). For simplicity, this counter is being referred to as "prescaler" throughout this data sheet. Note that there is only one prescaler available which is mutually exclusively shared between the Timer0 module and the Watchdog Timer. Thus, a prescaler assignment for the Timer0 module means that there is no prescaler for the Watchdog Timer, and vice-versa.

The prescaler is not readable or writable.

The PSA and PS2:PS0 bits (OPTION\_REG<3:0>) determine the prescaler assignment and prescale ratio.

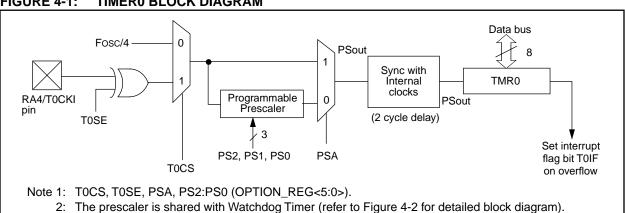

Clearing bit PSA will assign the prescaler to the Timer0 module. When the prescaler is assigned to the Timer0 module, prescale values of 1:2, 1:4, ..., 1:256 are selectable.

Setting bit PSA will assign the prescaler to the Watchdog Timer (WDT). When the prescaler is assigned to the WDT, prescale values of 1:1, 1:2, ..., 1:128 are selectable.

When assigned to the Timer0 module, all instructions writing to the TMR0 register (e.g. CLRF 1, MOVWF 1, 1,x....etc.) will clear the prescaler. When assigned to WDT, a CLRWDT instruction will clear the prescaler along with the WDT.

Writing to TMR0 when the prescaler is Note: assigned to Timer0 will clear the prescaler count, but will not change the prescaler assignment.

FIGURE 4-1: **TIMERO BLOCK DIAGRAM** 

### 4.2.1 SWITCHING PRESCALER ASSIGNMENT

The prescaler assignment is fully under software control, i.e., it can be changed "on the fly" during program execution.

Note:

To avoid an unintended device RESET, a specific instruction sequence (shown in the PICmicro™ Mid-Range Reference Manual, DS3023) must be executed when changing the prescaler assignment from Timer0 to the WDT. This sequence must be followed even if the WDT is disabled.

### 4.3 <u>Timer0 Interrupt</u>

The TMR0 interrupt is generated when the TMR0 register overflows from FFh to 00h. This overflow sets bit T0IF (INTCON<2>). The interrupt can be masked by clearing bit T0IE (INTCON<5>). Bit T0IF must be cleared in software by the Timer0 module interrupt service routine before re-enabling this interrupt. The TMR0 interrupt cannot awaken the processor from SLEEP since the timer is shut off during SLEEP.

FIGURE 4-2: BLOCK DIAGRAM OF THE TIMERO/WDT PRESCALER

### 5.0 DATA EEPROM MEMORY

The EEPROM data memory is readable and writable during normal operation (full VDD range). This memory is not directly mapped in the register file space. Instead it is indirectly addressed through the Special Function Registers. There are four SFRs used to read and write this memory. These registers are:

- EECON1
- EECON2 (Not a physically implemented register)
- EEDATA
- EEADR

EEDATA holds the 8-bit data for read/write, and EEADR holds the address of the EEPROM location being accessed. PIC16F84A devices have 64 bytes of data EEPROM with an address range from 0h to 3Fh.

The EEPROM data memory allows byte read and write. A byte write automatically erases the location and writes the new data (erase before write). The EEPROM data memory is rated for high erase/write cycles. The write time is controlled by an on-chip timer. The write-time will vary with voltage and temperature as well as from chip to chip. Please refer to AC specifications for exact limits.

When the device is code protected, the CPU may continue to read and write the data EEPROM memory. The device programmer can no longer access this memory.

Additional information on the Data EEPROM is available in the PICmicro™ Mid-Range Reference Manual, (DS33023).

. ..

### 5.1 Reading the EEPROM Data Memory

To read a data memory location, the user must write the address to the EEADR register and then set control bit RD (EECON1<0>). The data is available, in the very next cycle, in the EEDATA register; therefore it can be read in the next instruction. EEDATA will hold this value until another read or until it is written to by the user (during a write operation).

### **EXAMPLE 5-1: DATA EEPROM READ**

```
STATUS, RPO ; Bank 0
BCF
MOVLW
        CONFIG_ADDR ;
MOVWF
        EEADR
                    ; Address to read
        STATUS, RPO ; Bank 1
BSF
BSF
        EECON1, RD
                    ; EE Read
BCF
        STATUS, RPO ; Bank 0
MOVF
        EEDATA, W
                     ; W = EEDATA
```

### 5.2 Writing to the EEPROM Data Memory

To write an EEPROM data location, the user must first write the address to the EEADR register and the data to the EEDATA register. Then the user must follow a specific sequence to initiate the write for each byte.

### **EXAMPLE 5-1: DATA EEPROM WRITE**

```
STATUS, RPO ; Bank 1
   BSF
           INTCON, GIE ; Disable INTs.
  BCF
           EECON1, WREN ; Enable Write
  BSF
   MOVLW
                        ;
                        ; Write 55h
  MOVWF
           EECON2
MOVLW
MOVWF
BSF
           AAh
           EECON2
                        ; Write AAh
           EECON1,WR
                        ; Set WR bit
                            begin write
   BSF
           INTCON, GIE ; Enable INTs.
```

The write will not initiate if the above sequence is not exactly followed (write 55h to EECON2, write AAh to EECON2, then set WR bit) for each byte. We strongly recommend that interrupts be disabled during this code segment.

Additionally, the WREN bit in EECON1 must be set to enable write. This mechanism prevents accidental writes to data EEPROM due to errant (unexpected)

code execution (i.e., lost programs). The user should keep the WREN bit clear at all times, except when updating EEPROM. The WREN bit is not cleared by hardware

After a write sequence has been initiated, clearing the WREN bit will not affect this write cycle. The WR bit will be inhibited from being set unless the WREN bit is set.

At the completion of the write cycle, the WR bit is cleared in hardware and the EE Write Complete Interrupt Flag bit (EEIF) is set. The user can either enable this interrupt or poll this bit. EEIF must be cleared by software.

### 5.3 Write Verify

Depending on the application, good programming practice may dictate that the value written to the Data EEPROM should be verified (Example 5-1) to the desired value to be written. This should be used in applications where an EEPROM bit will be stressed near the specification limit. The Total Endurance disk will help determine your comfort level.

Generally the EEPROM write failure will be a bit which was written as a '0', but reads back as a '1' (due to leakage off the bit).

### **EXAMPLE 5-1: WRITE VERIFY**

```
BCF
          STATUS, RPO; Bank 0
    :
                      ; Any code can go here
    :
   MOVF
          EEDATA, W
                     ; Must be in Bank 0
          STATUS, RP0 ; Bank 1
   BSF
READ
   BSF
          EECON1, RD ; YES, Read the
                     ; value written
   BCF
          STATUS, RP0 ; Bank 0
; Is the value written (in W reg) and
   read (in EEDATA) the same?
;
    SUBWF EEDATA, W
   BTFSS STATUS, Z
                     ; Is difference 0?
   GOTO WRITE ERR
                     ; NO, Write error
                      ; YES, Good write
                      ; Continue program
```

## 6.0 SPECIAL FEATURES OF THE CPU

What sets a microcontroller apart from other processors are special circuits to deal with the needs of real time applications. The PIC16F84A has a host of such features intended to maximize system reliability, minimize cost through elimination of external components, provide power saving operating modes and offer code protection. These features are:

- OSC Selection
- Reset
  - Power-on Reset (POR)
  - Power-up Timer (PWRT)
  - Oscillator Start-up Timer (OST)
- Interrupts
- Watchdog Timer (WDT)
- SLEEP
- · Code protection
- · ID locations
- · In-circuit serial programming

The PIC16F84A has a Watchdog Timer which can be shut off only through configuration bits. It runs off its own RC oscillator for added reliability. There are two timers that offer necessary delays on power-up. One is the Oscillator Start-up Timer (OST), intended to keep

the chip in reset until the crystal oscillator is stable. The other is the Power-up Timer (PWRT), which provides a fixed delay of 72 ms (nominal) on power-up only. This design keeps the device in reset while the power supply stabilizes. With these two timers on-chip, most applications need no external reset circuitry.

SLEEP mode offers a very low current power-down mode. The user can wake-up from SLEEP through external reset, Watchdog Timer time-out or through an interrupt. Several oscillator options are provided to allow the part to fit the application. The RC oscillator option saves system cost while the LP crystal option saves power. A set of configuration bits are used to select the various options.

Additional information on special features is available in the PICmicro™ Mid-Range Reference Manual, (DS33023).

### 6.1 Configuration Bits

The configuration bits can be programmed (read as '0') or left unprogrammed (read as '1') to select various device configurations. These bits are mapped in program memory location 2007h.

Address 2007h is beyond the user program memory space and it belongs to the special test/configuration memory space (2000h - 3FFFh). This space can only be accessed during programming.

### 6.2 <u>Oscillator Configurations</u>

### 6.2.1 OSCILLATOR TYPES

The PIC16F84A can be operated in four different oscillator modes. The user can program two configuration bits (FOSC1 and FOSC0) to select one of these four modes:

LP Low Power CrystalXT Crystal/Resonator

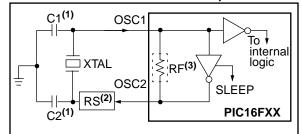

• HS High Speed Crystal/Resonator

RC Resistor/Capacitor

### 6.2.2 CRYSTAL OSCILLATOR / CERAMIC RESONATORS

In XT, LP or HS modes a crystal or ceramic resonator is connected to the OSC1/CLKIN and OSC2/CLKOUT pins to establish oscillation (Figure 6-2).

FIGURE 6-2: CRYSTAL/CERAMIC
RESONATOR OPERATION
(HS, XT OR LP OSC
CONFIGURATION)

Note1: See Table 6-1 for recommended values of C1 and C2.

- 2: A series resistor (RS) may be required for AT strip cut crystals.
- 3: RF varies with the crystal chosen.

The PIC16F84A oscillator design requires the use of a parallel cut crystal. Use of a series cut crystal may give a frequency out of the crystal manufacturers specifications. When in XT, LP or HS modes, the device can have an external clock source to drive the OSC1/CLKIN pin (Figure 6-3).

FIGURE 6-3: EXTERNAL CLOCK INPUT OPERATION (HS, XT OR LP OSC CONFIGURATION)

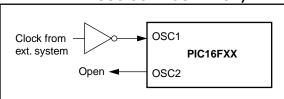

TABLE 6-1 CAPACITOR SELECTION FOR CERAMIC RESONATORS

| Ranges Tested:           |       |               |                |                 |  |  |  |
|--------------------------|-------|---------------|----------------|-----------------|--|--|--|
| Mode                     |       | Freq          | OSC1/C1        | OSC2/C2         |  |  |  |
| XT                       |       | 455 kHz       | 47 - 100 pF    | 47 - 100 pF     |  |  |  |
|                          |       | 2.0 MHz       | 15 - 33 pF     | 15 - 33 pF      |  |  |  |
|                          |       | 4.0 MHz       | 15 - 33 pF     | 15 33 pF        |  |  |  |
| HS                       |       | 8.0 MHz       | 15 - 33 pF     | 15 < 33 pF      |  |  |  |
|                          |       | 10.0 MHz      | 15 - 33 pF     | 15 33 pF        |  |  |  |
| Note: F                  | Recon | nmended value | s of C1 and C2 | re identical to |  |  |  |
| the ranges tested table. |       |               |                |                 |  |  |  |

Higher capacitance increases the stability of the oscillator but also increases the start-up time. These values are for design guidance only. Since each resonator has its own characteristics, the user should consult the resonator manufacturer for the appropriate values of external components.

| None of the resonators had built-in capacitors. |                         |        |  |  |  |  |  |  |

TABLE 6-2 CAPACITOR SELECTION FOR CRYSTAL OSCILLATOR

| Mode | Freq           | OSC1/C1      | OSC2/C2      |
|------|----------------|--------------|--------------|
| LP   | 32 kHz         | 68 - 100 pF  | 68 - 100 pF  |
|      | 200 kHz        | 15 - 33 pF   | 15 - 33 pF   |
| XT   | 100 kHz        | 100 - 150 pF | 100 - 150 pF |
|      | 2 MHz          | 15 - 33 pF   | 15 - 33 pF   |
|      | 4 MHz          | 15 - 33 pF   | 15 - 33 pE   |
| HS   | 4 MHz          | 15 - 33 pF   | 15-33 pF     |
|      | 10 MHz         | 15 - 33 pF   | 15 €33 pF    |
| HS   | 4 MHz<br>4 MHz | 15 - 33 pF   |              |

Note: Higher capacitance increases the stability of oscillator but also increases the start up time. These values are for design guidance only. Rs may be required in HS mode as well as XT mode to avoid overdriving crystals with low drive level specification. Since each crystal has its own characteristics, the user should consult the crystal manufacturer for appropriate values of external comportents.

For  $\sqrt{00}$  > 4.5  $\sqrt{1}$ , C1 = C2  $\approx 30$  pF is recommended.

### 6.2.3 RC OSCILLATOR

For timing insensitive applications the RC device option offers additional cost savings. The RC oscillator frequency is a function of the supply voltage, the resistor (Rext) values, capacitor (Cext) values, and the operating temperature. In addition to this, the oscillator frequency will vary from unit to unit due to normal process parameter variation. Furthermore, the difference in lead frame capacitance between package types also affects the oscillation frequency, especially for low Cext values. The user needs to take into account variation due to tolerance of the external R and C components. Figure 6-4 shows how an R/C combination is connected to the PIC16F84A.

FIGURE 6-4: RC OSCILLATOR MODE

### 6.3 Reset

The PIC16F84A differentiates between various kinds of reset:

- Power-on Reset (POR)
- MCLR reset during normal operation
- MCLR reset during SLEEP
- WDT Reset (during normal operation)
- WDT Wake-up (during SLEEP)

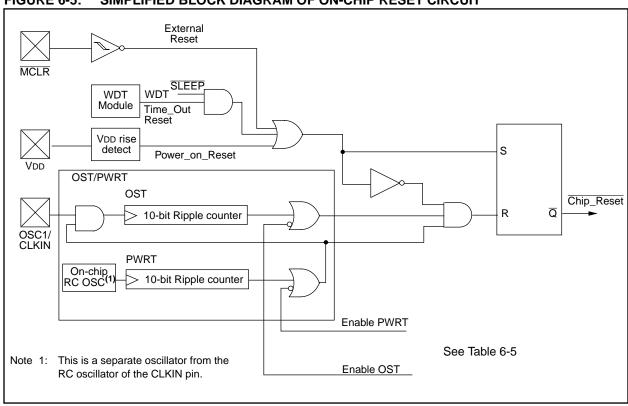

Figure 6-5 shows a simplified block diagram of the on-chip reset circuit. The  $\overline{MCLR}$  reset path has a noise filter to ignore small pulses. The electrical specifications state the pulse width requirements for the  $\overline{MCLR}$  pin.

Some registers are not affected in any reset condition; their status is unknown on a POR reset and unchanged in any other reset. Most other registers are reset to a "reset state" on POR,  $\overline{\text{MCLR}}$  or WDT reset during normal operation and on  $\overline{\text{MCLR}}$  reset during SLEEP. They are not affected by a WDT reset during SLEEP, since this reset is viewed as the resumption of normal operation.

Table 6-3 gives a description of reset conditions for the program counter (PC) and the STATUS register. Table 6-4 gives a full description of reset states for all registers.

The  $\overline{\text{TO}}$  and  $\overline{\text{PD}}$  bits are set or cleared differently in different reset situations (Section 6.7). These bits are used in software to determine the nature of the reset.

FIGURE 6-5: SIMPLIFIED BLOCK DIAGRAM OF ON-CHIP RESET CIRCUIT

. ..

TABLE 6-3 RESET CONDITION FOR PROGRAM COUNTER AND THE STATUS REGISTER

| Condition                           | Program Counter       | STATUS Register |
|-------------------------------------|-----------------------|-----------------|
| Power-on Reset                      | 000h                  | 0001 1xxx       |
| MCLR Reset during normal operation  | 000h                  | 000u uuuu       |
| MCLR Reset during SLEEP             | 000h                  | 0001 0uuu       |
| WDT Reset (during normal operation) | 000h                  | 0000 1uuu       |
| WDT Wake-up                         | PC + 1                | uuu0 0uuu       |
| Interrupt wake-up from SLEEP        | PC + 1 <sup>(1)</sup> | uuu1 0uuu       |

Legend: u = unchanged, x = unknown.

Note 1: When the wake-up is due to an interrupt and the GIE bit is set, the PC is loaded with the interrupt vector (0004h).

Legend: u = unchanged, x = unknown, -= unimplemented bit read as '0', <math>q = value depends on condition.

- Note 1: One or more bits in INTCON will be affected (to cause wake-up).
  - 2: When the wake-up is due to an interrupt and the GIE bit is set, the PC is loaded with the interrupt vector (0004h).
  - 3: Table 6-3 lists the reset value for each specific condition.
  - 4: On any device reset, these pins are configured as inputs.
  - 5: This is the value that will be in the port output latch.

. ..

### 6.4 Power-on Reset (POR)

A Power-on Reset pulse is generated on-chip when VDD rise is detected (in the range of 1.2V - 1.7V). To take advantage of the POR, just tie the  $\overline{\text{MCLR}}$  pin directly (or through a resistor) to VDD. This will eliminate external RC components usually needed to create Power-on Reset. A minimum rise time for VDD must be met for this to operate properly. See Electrical Specifications for details.

When the device starts normal operation (exits the reset condition), device operating parameters (voltage, frequency, temperature, ...) must be meet to ensure operation. If these conditions are not met, the device must be held in reset until the operating conditions are met.

For additional information, refer to Application Note AN607, "Power-up Trouble Shooting."

The POR circuit does not produce an internal reset when VDD declines.

### 6.5 Power-up Timer (PWRT)

The Power-up Timer (PWRT) provides a fixed 72 ms nominal time-out (TPWRT) from POR (Figure 6-7, Figure 6-8, Figure 6-9 and Figure 6-10). The Power-up Timer operates on an internal RC oscillator. The chip is kept in reset as long as the PWRT is active. The PWRT delay allows the VDD to rise to an acceptable level (Possible exception shown in Figure 6-10).

A configuration bit,  $\overline{PWRTE}$ , can enable/disable the PWRT. See Figure 6-1 for the operation of the  $\overline{PWRTE}$  bit for a particular device.

The power-up time delay TPWRT will vary from chip to chip due to VDD, temperature, and process variation. See DC parameters for details.

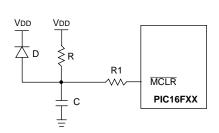

### 6.6 Oscillator Start-up Timer (OST)

The Oscillator Start-up Timer (OST) provides a 1024 oscillator cycle delay (from OSC1 input) after the PWRT delay ends (Figure 6-7, Figure 6-8, Figure 6-9 and Figure 6-10). This ensures the crystal oscillator or resonator has started and stabilized.

The OST time-out (Tost) is invoked only for XT, LP and HS modes and only on Power-on Reset or wake-up from SLEEP.

When VDD rises very slowly, it is possible that the TPWRT time-out and TOST time-out will expire before VDD has reached its final value. In this case (Figure 6-10), an external power-on reset circuit may be necessary (Figure 6-6).

FIGURE 6-6: EXTERNAL POWER-ON
RESET CIRCUIT (FOR SLOW
VDD POWER-UP)

- Note 1: External Power-on Reset circuit is required only if VDD power-up rate is too slow. The diode D helps discharge the capacitor quickly when VDD powers down.
  - 2:  $R < 40 \text{ k}\Omega$  is recommended to make sure that voltage drop across R does not exceed 0.2V (max leakage current spec on  $\overline{MCLR}$  pin is 5  $\mu$ A). A larger voltage drop will degrade VIH level on the  $\overline{MCLR}$  pin.
  - 3: R1 =  $100\Omega$  to 1 k $\Omega$  will limit any current flowing into  $\overline{MCLR}$  from external capacitor C in the event of an  $\overline{MCLR}$  pin breakdown due to ESD or EOS.

FIGURE 6-7: TIME-OUT SEQUENCE ON POWER-UP (MCLR NOT TIED TO VDD): CASE 1

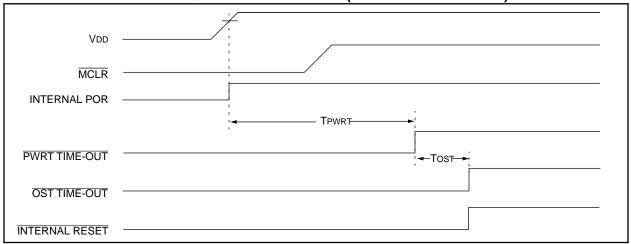

FIGURE 6-8: TIME-OUT SEQUENCE ON POWER-UP (MCLR NOT TIED TO VDD): CASE 2

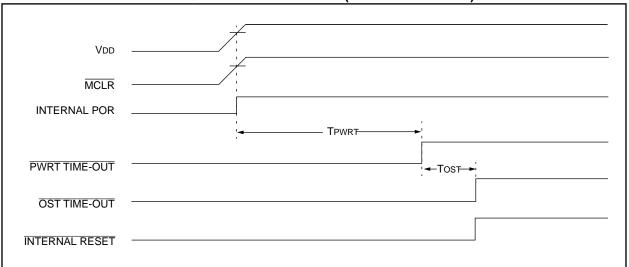

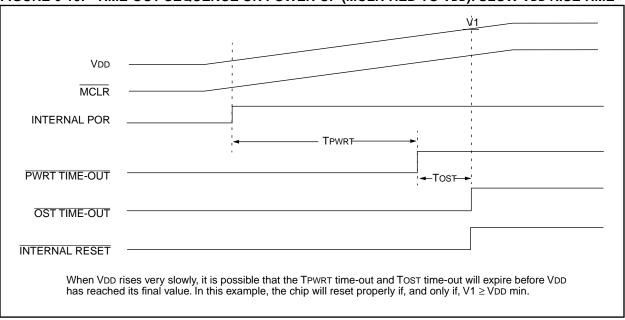

FIGURE 6-10: TIME-OUT SEQUENCE ON POWER-UP (MCLR TIED TO VDD): SLOW VDD RISETIME

. ...

### 6.7 <u>Time-out Sequence and Power-down</u> Status Bits (TO/PD)

On power-up (Figure 6-7, Figure 6-8, Figure 6-9 and Figure 6-10) the time-out sequence is as follows: First PWRT time-out is invoked after a POR has expired. Then the OST is activated. The total time-out will vary based on oscillator configuration and PWRTE configuration bit status. For example, in RC mode with the PWRT disabled, there will be no time-out at all.

TABLE 6-5 TIME-OUT IN VARIOUS SITUATIONS

| Oscillator    | Powe                | Wake-up          |               |
|---------------|---------------------|------------------|---------------|
| Configuration | PWRT<br>Enabled     | PWRT<br>Disabled | from<br>SLEEP |
| XT, HS, LP    | 72 ms +<br>1024Tosc | 1024Tosc         | 1024Tosc      |
| RC            | 72 ms               | _                | _             |

Since the time-outs occur from the POR reset pulse, if  $\overline{\text{MCLR}}$  is kept low long enough, the time-outs will expire. Then bringing  $\overline{\text{MCLR}}$  high, execution will begin immediately (Figure 6-7). This is useful for testing purposes or to synchronize more than one PIC16F84A device when operating in parallel.

Table 6-6 shows the significance of the  $\overline{\text{TO}}$  and  $\overline{\text{PD}}$  bits. Table 6-3 lists the reset conditions for some special registers, while Table 6-4 lists the reset conditions for all the registers.

TABLE 6-6 STATUS BITS AND THEIR SIGNIFICANCE

| TO | PD | Condition                            |
|----|----|--------------------------------------|
| 1  | 1  | Power-on Reset                       |
| 0  | х  | Illegal, TO is set on POR            |
| х  | 0  | Illegal, PD is set on POR            |
| 0  | 1  | WDT Reset (during normal operation)  |
| 0  | 0  | WDT Wake-up                          |
| 1  | 1  | MCLR Reset during normal operation   |
| 1  | 0  | MCLR Reset during SLEEP or interrupt |
|    |    | wake-up from SLEEP                   |

### 6.8 <u>Interrupts</u>

The PIC16F84A has 4 sources of interrupt:

- · External interrupt RB0/INT pin
- · TMR0 overflow interrupt
- PORTB change interrupts (pins RB7:RB4)
- · Data EEPROM write complete interrupt

The interrupt control register (INTCON) records individual interrupt requests in flag bits. It also contains the individual and global interrupt enable bits.

The global interrupt enable bit, GIE (INTCON<7>) enables (if set) all un-masked interrupts or disables (if cleared) all interrupts. Individual interrupts can be disabled through their corresponding enable bits in INTCON register. Bit GIE is cleared on reset.

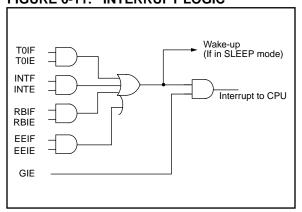

The "return from interrupt" instruction, RETFIE, exits interrupt routine as well as sets the GIE bit, which re-enable interrupts.

The RB0/INT pin interrupt, the RB port change interrupt and the TMR0 overflow interrupt flags are contained in the INTCON register.

When an interrupt is responded to; the GIE bit is cleared to disable any further interrupt, the return address is pushed onto the stack and the PC is loaded with 0004h. For external interrupt events, such as the RB0/INT pin or PORTB change interrupt, the interrupt latency will be three to four instruction cycles. The exact latency depends when the interrupt event occurs. The latency is the same for both one and two cycle instructions. Once in the interrupt service routine the source(s) of the interrupt can be determined by polling the interrupt flag bits. The interrupt flag bit(s) must be cleared in software before re-enabling interrupts to avoid infinite interrupt requests.

Note 1: Individual interrupt flag bits are set regardless of the status of their corresponding mask bit or the GIE bit.

FIGURE 6-11: INTERRUPT LOGIC

11

#### 6.8.1 INT INTERRUPT

External interrupt on RB0/INT pin is edge triggered: either rising if INTEDG bit (OPTION\_REG<6>) is set, or falling, if INTEDG bit is clear. When a valid edge appears on the RB0/INT pin, the INTF bit (INTCON<1>) is set. This interrupt can be disabled by clearing control bit INTE (INTCON<4>). Flag bit INTF must be cleared in software via the interrupt service routine before re-enabling this interrupt. The INT interrupt can wake the processor from SLEEP (Section 6.11) only if the INTE bit was set prior to going into SLEEP. The status of the GIE bit decides whether the processor branches to the interrupt vector following wake-up.

### 6.8.2 TMR0 INTERRUPT

An overflow (FFh  $\rightarrow$  00h) in TMR0 will set flag bit T0IF (INTCON<2>). The interrupt can be enabled/disabled by setting/clearing enable bit T0IE (INTCON<5>) (Section 4.0).

### 6.8.3 PORB INTERRUPT

An input change on PORTB<7:4> sets flag bit RBIF (INTCON<0>). The interrupt can be enabled/disabled by setting/clearing enable bit RBIE (INTCON<3>) (Section 3.2).

**Note 1:** For a change on the I/O pin to be recognized, the pulse width must be at least Tcy wide.

### 6.8.4 DATA EEPROM INTERRUPT

At the completion of a data EEPROM write cycle, flag bit EEIF (EECON1<4>) will be set. The interrupt can be enabled/disabled by setting/clearing enable bit EEIE (INTCON<6>) (Section 5.0).

### 6.9 Context Saving During Interrupts

During an interrupt, only the return PC value is saved on the stack. Typically, users wish to save key register values during an interrupt (e.g., W register and STATUS register). This is implemented in software.

Example 6-1 stores and restores the STATUS and W register's values. The User defined registers, W\_TEMP and STATUS\_TEMP are the temporary storage locations for the W and STATUS registers values.

Example 6-1 does the following:

- a) Stores the W register.
- b) Stores the STATUS register in STATUS\_TEMP.
- c) Executes the Interrupt Service Routine code.
- d) Restores the STATUS (and bank select bit) register.
- e) Restores the W register.

### **EXAMPLE 6-1: SAVING STATUS AND W REGISTERS IN RAM**

```
PUSH
       MOVWF
               W_TEMP
                                ; Copy W to TEMP register,
       SWAPF
               STATUS, W
                                ; Swap status to be saved into W
       MOVWF
               STATUS_TEMP
                                ; Save status to STATUS_TEMP register
ISR
       :
       :
                                ; Interrupt Service Routine
       .
                                   should configure Bank as required
POP
       SWAPF
               STATUS_TEMP, W ; Swap nibbles in STATUS_TEMP register
                                ; and place result into W
                                ; Move W into STATUS register
       MOVWF
               STATUS
                                    (sets bank to original state)
       SWAPF
               W_TEMP, F
                                ; Swap nibbles in W_TEMP and place result in W_TEMP
       SWAPF
               W_TEMP, W
                                ; Swap nibbles in W_TEMP and place result into W
```

. ..

### 6.10 Watchdog Timer (WDT)

The Watchdog Timer is a free running on-chip RC oscillator which does not require any external components. This RC oscillator is separate from the RC oscillator of the OSC1/CLKIN pin. That means that the WDT will run even if the clock on the OSC1/CLKIN and OSC2/CLKOUT pins of the device has been stopped, for example, by execution of a SLEEP instruction. During normal operation a WDT time-out generates a device RESET. If the device is in SLEEP mode, a WDT Wake-up causes the device to wake-up and continue with normal operation. The WDT can be permanently disabled by programming configuration bit WDTE as a '0' (Section 6.1).

### 6.10.1 WDT PERIOD

The WDT has a nominal time-out period of 18 ms, (with no prescaler). The time-out periods vary with temperature, VDD and process variations from part to

part (see DC specs). If longer time-out periods are desired, a prescaler with a division ratio of up to 1:128 can be assigned to the WDT under software control by writing to the OPTION\_REG register. Thus, time-out periods up to 2.3 seconds can be realized.

The CLRWDT and SLEEP instructions clear the WDT and the postscaler (if assigned to the WDT) and prevent it from timing out and generating a device RESET condition.

The TO bit in the STATUS register will be cleared upon a WDT time-out.

### 6.10.2 WDT PROGRAMMING CONSIDERATIONS

It should also be taken into account that under worst case conditions (VDD = Min., Temperature = Max., max. WDT prescaler) it may take several seconds before a WDT time-out occurs.

### FIGURE 6-12: WATCHDOG TIMER BLOCK DIAGRAM

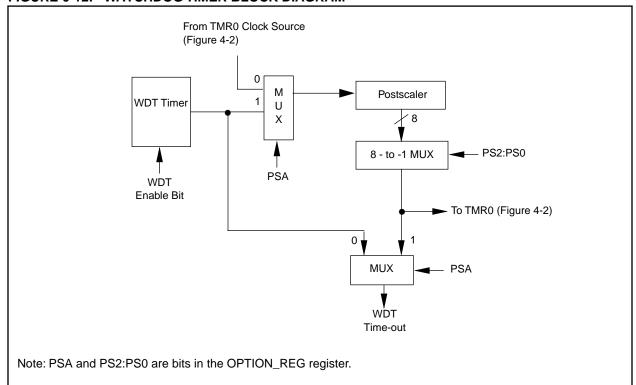

TABLE 6-7 SUMMARY OF REGISTERS ASSOCIATED WITH THE WATCHDOG TIMER

| Addr  | Name         | Bit 7 | Bit 6  | Bit 5 | Bit 4 | Bit 3                | Bit 2 | Bit 1 | Bit 0 | Value on<br>Power-on<br>Reset | Value on all other resets |
|-------|--------------|-------|--------|-------|-------|----------------------|-------|-------|-------|-------------------------------|---------------------------|
| 2007h | Config. bits | (2)   | (2)    | (2)   | (2)   | PWRTE <sup>(1)</sup> | WDTE  | FOSC1 | FOSC0 | (2)                           |                           |
| 81h   | OPTION_REG   | RBPU  | INTEDG | T0CS  | T0SE  | PSA                  | PS2   | PS1   | PS0   | 1111 1111                     | 1111 1111                 |

Legend: x = unknown. Shaded cells are not used by the WDT.

Note 1: See Figure 6-1 for operation of the PWRTE bit.

2: See Figure 6-1 and Section 6.12 for operation of the Code and Data protection bits.

. . .

### 6.11 Power-down Mode (SLEEP)

A device may be powered down (SLEEP) and later powered up (Wake-up from SLEEP).

#### 6.11.1 SLEEP

The Power-down mode is entered by executing the SLEEP instruction.

If enabled, the Watchdog Timer is cleared (but keeps running), the  $\overline{PD}$  bit (STATUS<3>) is cleared, the  $\overline{TO}$  bit (STATUS<4>) is set, and the oscillator driver is turned off. The I/O ports maintain the status they had before the SLEEP instruction was executed (driving high, low, or hi-impedance).

For the lowest current consumption in SLEEP mode, place all I/O pins at either at VDD or Vss, with no external circuitry drawing current from the I/O pins, and disable external clocks. I/O pins that are hi-impedance inputs should be pulled high or low externally to avoid switching currents caused by floating inputs. The TOCKI input should also be at VDD or Vss. The contribution from on-chip pull-ups on PORTB should be considered.

The MCLR pin must be at a logic high level (VIHMC).

It should be noted that a RESET generated by a WDT time-out does not drive the MCLR pin low.

#### 6.11.2 WAKE-UP FROM SLEEP

The device can wake-up from SLEEP through one of the following events:

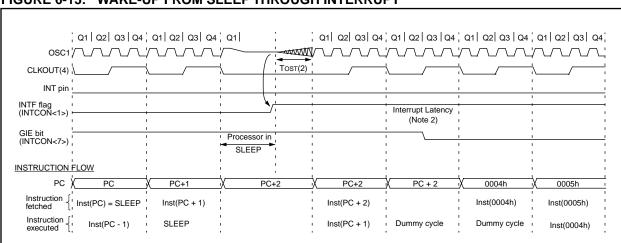

- 1. External reset input on MCLR pin.
- 2. WDT Wake-up (if WDT was enabled).
- Interrupt from RB0/INT pin, RB port change, or data EEPROM write complete.

Peripherals cannot generate interrupts during SLEEP, since no on-chip Q clocks are present.

The first event ( $\overline{MCLR}$  reset) will cause a device reset. The two latter events are considered a continuation of program execution. The  $\overline{TO}$  and  $\overline{PD}$  bits can be used to determine the cause of a device reset. The  $\overline{PD}$  bit, which is set on power-up, is cleared when SLEEP is invoked. The  $\overline{TO}$  bit is cleared if a WDT time-out occurred (and caused wake-up).

While the SLEEP instruction is being executed, the next instruction (PC + 1) is pre-fetched. For the device to wake-up through an interrupt event, the corresponding interrupt enable bit must be set (enabled). Wake-up occurs regardless of the state of the GIE bit. If the GIE bit is clear (disabled), the device continues execution at the instruction after the SLEEP instruction. If the GIE bit is set (enabled), the device executes the instruction after the SLEEP instruction and then branches to the interrupt address (0004h). In cases where the execution of the instruction following SLEEP is not desirable, the user should have a NOP after the SLEEP instruction.

Note 1: XT, HS or LP oscillator mode assumed.

- 2: Tost = 1024Tosc (drawing not to scale) This delay will not be there for RC osc mode.
- 3: GIE = '1' assumed. In this case after wake- up, the processor jumps to the interrupt routine. If GIE = '0', execution will continue in-line.
- 4: CLKOUT is not available in these osc modes, but shown here for timing reference.

#### 6.11.3 WAKE-UP USING INTERRUPTS

When global interrupts are disabled (GIE cleared) and any interrupt source has both its interrupt enable bit and interrupt flag bit set, one of the following will occur:

- If the interrupt occurs before the execution of a SLEEP instruction, the SLEEP instruction will complete as a NOP. Therefore, the WDT and WDT postscaler will not be cleared, the TO bit will not be set and PD bits will not be cleared.
- If the interrupt occurs during or after the execution of a SLEEP instruction, the device will immediately wake up from sleep. The SLEEP instruction will be completely executed before the wake-up. Therefore, the WDT and WDT postscaler will be cleared, the TO bit will be set and the PD bit will be cleared.

Even if the flag bits were checked before executing a SLEEP instruction, it may be possible for flag bits to become set before the SLEEP instruction completes. To determine whether a SLEEP instruction executed, test the  $\overline{PD}$  bit. If the  $\overline{PD}$  bit is set, the SLEEP instruction was executed as a NOP.

To ensure that the WDT is cleared, a CLRWDT instruction should be executed before a SLEEP instruction.

### 6.12 <u>Program Verification/Code Protection</u>

If the code protection bit(s) have not been programmed, the on-chip program memory can be read out for verification purposes.

**Note:** Microchip does not recommend code protecting windowed devices.

### 6.13 ID Locations

Four memory locations (2000h - 2004h) are designated as ID locations to store checksum or other code identification numbers. These locations are not accessible during normal execution but are readable and writable only during program/verify. Only the four least significant bits of ID location are usable.

### 6.14 <u>In-Circuit Serial Programming</u>

PIC16F84A microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock and data, and three other lines for power, ground, and the programming voltage. Customers can manufacture boards with unprogrammed devices, and then program the microcontroller just before shipping the product, allowing the most recent firmware or custom firmware to be programmed.

For complete details of serial programming, please refer to the In-Circuit Serial Programming (ICSP™) Guide, (DS30277).

### 7.0 INSTRUCTION SET SUMMARY

Each PIC16CXXX instruction is a 14-bit word divided into an OPCODE which specifies the instruction type and one or more operands which further specify the operation of the instruction. The PIC16CXX instruction set summary in Table 7-2 lists **byte-oriented**, **bit-oriented**, and **literal and control** operations. Table 7-1 shows the opcode field descriptions.

For **byte-oriented** instructions, 'f' represents a file register designator and 'd' represents a destination designator. The file register designator specifies which file register is to be used by the instruction.

The destination designator specifies where the result of the operation is to be placed. If 'd' is zero, the result is placed in the W register. If 'd' is one, the result is placed in the file register specified in the instruction.

For **bit-oriented** instructions, 'b' represents a bit field designator which selects the number of the bit affected by the operation, while 'f' represents the number of the file in which the bit is located.

For **literal and control** operations, 'k' represents an eight or eleven bit constant or literal value.

TABLE 7-1 OPCODE FIELD DESCRIPTIONS

| Field | Description                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| f     | Register file address (0x00 to 0x7F)                                                                                                                               |
| W     | Working register (accumulator)                                                                                                                                     |
| b     | Bit address within an 8-bit file register                                                                                                                          |
| k     | Literal field, constant data or label                                                                                                                              |
| x     | Don't care location (= 0 or 1) The assembler will generate code with x = 0. It is the recommended form of use for compatibility with all Microchip software tools. |
| d     | Destination select; d = 0: store result in W,<br>d = 1: store result in file register f.<br>Default is d = 1                                                       |
| PC    | Program Counter                                                                                                                                                    |
| TO    | Time-out bit                                                                                                                                                       |
| PD    | Power-down bit                                                                                                                                                     |

The instruction set is highly orthogonal and is grouped into three basic categories:

- Byte-oriented operations
- · Bit-oriented operations
- · Literal and control operations

All instructions are executed within one single instruction cycle, unless a conditional test is true or the program counter is changed as a result of an instruction. In this case, the execution takes two instruction cycles with the second cycle executed as a NOP. One instruction cycle consists of four oscillator periods. Thus, for an oscillator frequency of 4 MHz, the normal instruction execution time is 1  $\mu s$ . If a conditional test is true or the program counter is changed as a result of an instruction, the instruction execution time is 2  $\mu s$ .

Table 7-2 lists the instructions recognized by the MPASM assembler.

Figure 7-1 shows the general formats that the instructions can have.

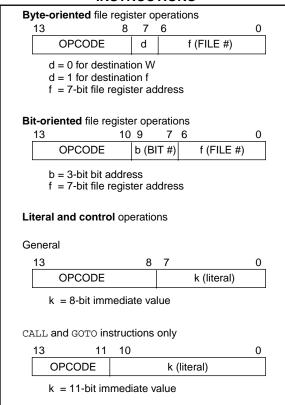

**Note:** To maintain upward compatibility with future PIC16CXXX products, <u>do not use</u> the OPTION and TRIS instructions.

All examples use the following format to represent a hexadecimal number:

0xhł

where h signifies a hexadecimal digit.

## FIGURE 7-1: GENERAL FORMAT FOR INSTRUCTIONS

A description of each instruction is available in the  $PICmicro^{TM}$  Mid-Range Reference Manual, (DS33023).

. .. .

| IORLW                                  | k    | Inclusive OR literal with W                               | 1      | 11              | 1000 | kkkk | kkkk   | Z        |       |
| MOVLW                                  | k    | Move literal to W                                         | 1      | 11              | 00xx | kkkk | kkkk   |          |       |
| RETFIE                                 | -    | Return from interrupt                                     | 2      | 0.0             | 0000 | 0000 | 1001   |          |       |
| RETLW                                  | k    | Return with literal in W                                  | 2      | 11              | 01xx | kkkk | kkkk   |          |       |
| RETURN                                 | -    | Return from Subroutine                                    | 2      | 0.0             | 0000 | 0000 | 1000   |          |       |
| SLEEP                                  | -    | Go into standby mode                                      | 1      | 00              | 0000 | 0110 | 0011   | TO,PD    |       |
| SUBLW                                  | k    | Subtract W from literal                                   | 1      | 11              | 110x | kkkk | kkkk   | C,DC,Z   |       |
| XORLW                                  | k    | Exclusive OR literal with W                               | 1      | 11              | 1010 | kkkk | kkkk   | Z        |       |
|                                        |      | //O register is modified as a function of itself ( a.g. ) | L      |                 |      |      |        |          |       |

Note 1: When an I/O register is modified as a function of itself (e.g., MOVF PORTB, 1), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.

. ...

<sup>2:</sup> If this instruction is executed on the TMR0 register (and, where applicable, d = 1), the prescaler will be cleared if assigned to the Timer0 Module.

<sup>3:</sup> If Program Counter (PC) is modified or a conditional test is true, the instruction requires two cycles. The second cycle is executed as a NOP.

### 8.0 DEVELOPMENT SUPPORT

### 8.1 Development Tools

The PICmicro<sup>™</sup> microcontrollers are supported with a full range of hardware and software development tools:

- MPLAB™-ICE Real-Time In-Circuit Emulator
- ICEPIC™ Low-Cost PIC16C5X and PIC16CXXX In-Circuit Emulator
- PRO MATE® II Universal Programmer
- PICSTART<sup>®</sup> Plus Entry-Level Prototype Programmer
- SIMICE
- PICDEM-1 Low-Cost Demonstration Board
- PICDEM-2 Low-Cost Demonstration Board
- PICDEM-3 Low-Cost Demonstration Board
- MPASM Assembler
- MPLAB™ SIM Software Simulator
- MPLAB-C17 (C Compiler)
- Fuzzy Logic Development System (fuzzyTECH<sup>®</sup>-MP)
- KEELOQ<sup>®</sup> Evaluation Kits and Programmer

# 8.2 MPLAB-ICE: High Performance Universal In-Circuit Emulator with MPLAB IDE

The MPLAB-ICE Universal In-Circuit Emulator is intended to provide the product development engineer with a complete microcontroller design tool set for PICmicro microcontrollers (MCUs). MPLAB-ICE is supplied with the MPLAB Integrated Development Environment (IDE), which allows editing, "make" and download, and source debugging from a single environment.

Interchangeable processor modules allow the system to be easily reconfigured for emulation of different processors. The universal architecture of the MPLAB-ICE allows expansion to support all new Microchip microcontrollers.

The MPLAB-ICE Emulator System has been designed as a real-time emulation system with advanced features that are generally found on more expensive development tools. The PC compatible 386 (and higher) machine platform and Microsoft Windows<sup>®</sup> 3.x or Windows 95 environment were chosen to best make these features available to you, the end user.

MPLAB-ICE is available in two versions. MPLAB-ICE 1000 is a basic, low-cost emulator system with simple trace capabilities. It shares processor modules with the MPLAB-ICE 2000. This is a full-featured emulator system with enhanced trace, trigger, and data monitoring features. Both systems will operate across the entire operating speed reange of the PICmicro MCU.

### 8.3 <u>ICEPIC: Low-Cost PICmicro™</u> In-Circuit Emulator

ICEPIC is a low-cost in-circuit emulator solution for the Microchip PIC12CXXX, PIC16C5X and PIC16CXXX families of 8-bit OTP microcontrollers.

ICEPIC is designed to operate on PC-compatible machines ranging from 386 through Pentium™ based machines under Windows 3.x, Windows 95, or Windows NT environment. ICEPIC features real time, non-intrusive emulation.

### 8.4 PRO MATE II: Universal Programmer

The PRO MATE II Universal Programmer is a full-featured programmer capable of operating in stand-alone mode as well as PC-hosted mode. PRO MATE II is CE compliant.

The PRO MATE II has programmable VDD and VPP supplies which allows it to verify programmed memory at VDD min and VDD max for maximum reliability. It has an LCD display for displaying error messages, keys to enter commands and a modular detachable socket assembly to support various package types. In standalone mode the PRO MATE II can read, verify or program PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices. It can also set configuration and code-protect bits in this mode.

### 8.5 <u>PICSTART Plus Entry Level</u> <u>Development System</u>

The PICSTART programmer is an easy-to-use, low-cost prototype programmer. It connects to the PC via one of the COM (RS-232) ports. MPLAB Integrated Development Environment software makes using the programmer simple and efficient. PICSTART Plus is not recommended for production programming.

PICSTART Plus supports all PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices with up to 40 pins. Larger pin count devices such as the PIC16C923, PIC16C924 and PIC17C756 may be supported with an adapter socket. PICSTART Plus is CE compliant.

### 8.6 <u>SIMICE Entry-Level Hardware</u> Simulator

SIMICE is an entry-level hardware development system designed to operate in a PC-based environment with Microchip's simulator MPLAB™-SIM. Both SIM-ICE and MPLAB-SIM run under Microchip Technology's MPLAB Integrated Development Environment (IDE) software. Specifically, SIMICE provides hardware simulation for Microchip's PIC12C5XX, PIC12CE5XX, and PIC16C5X families of PICmicro™ 8-bit microcontrollers. SIMICE works in conjunction with MPLAB-SIM to provide non-real-time I/O port emulation. SIMICE enables a developer to run simulator code for driving the target system. In addition, the target system can provide input to the simulator code. This capability allows for simple and interactive debugging without having to manually generate MPLAB-SIM stimulus files. SIMICE is a valuable debugging tool for entrylevel system development.

### 8.7 <u>PICDEM-1 Low-Cost PICmicro</u> Demonstration Board

The PICDEM-1 is a simple board which demonstrates the capabilities of several of Microchip's microcontrollers. The microcontrollers supported are: PIC16C5X (PIC16C54 to PIC16C58A), PIC16C61, PIC16C62X, PIC16C71, PIC16C8X, PIC17C42, PIC17C43 and PIC17C44. All necessary hardware and software is included to run basic demo programs. The users can program the sample microcontrollers provided with the PICDEM-1 board, on a PRO MATE II or PICSTART-Plus programmer, and easily test firmware. The user can also connect the PICDEM-1 board to the MPLAB-ICE emulator and download the firmware to the emulator for testing. Additional prototype area is available for the user to build some additional hardware and connect it to the microcontroller socket(s). Some of the features include an RS-232 interface, a potentiometer for simulated analog input, push-button switches and eight LEDs connected to PORTB.

## 8.8 PICDEM-2 Low-Cost PIC16CXX Demonstration Board

The PICDEM-2 is a simple demonstration board that supports the PIC16C62, PIC16C64, PIC16C65, PIC16C73 and PIC16C74 microcontrollers. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-2 board, on a PRO MATE II programmer or PICSTART-Plus, and easily test firmware. The MPLAB-ICE emulator may also be used with the PICDEM-2 board to test firmware. Additional prototype area has been provided to the user for adding additional hardware and connecting it to the microcontroller socket(s). Some of the features include a RS-232 interface, push-button switches, a potentiometer for simulated analog input, a Serial EEPROM to demonstrate usage of the I<sup>2</sup>C bus and separate headers for connection to an LCD module and a keypad.

## 8.9 PICDEM-3 Low-Cost PIC16CXXX Demonstration Board

The PICDEM-3 is a simple demonstration board that supports the PIC16C923 and PIC16C924 in the PLCC package. It will also support future 44-pin PLCC microcontrollers with a LCD Module. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-3 board, on a PRO MATE II programmer or PICSTART Plus with an adapter socket, and easily test firmware. The MPLAB-ICE emulator may also be used with the PICDEM-3 board to test firmware. Additional prototype area has been provided to the user for adding hardware and connecting it to the microcontroller socket(s). Some of the features include an RS-232 interface, push-button switches, a potentiometer for simulated analog input, a thermistor and separate headers for connection to an external LCD module and a keypad. Also provided on the PICDEM-3 board is an LCD panel, with 4 commons and 12 segments, that is capable of displaying time, temperature and day of the week. The PICDEM-3 provides an additional RS-232 interface and Windows 3.1 software for showing the demultiplexed LCD signals on a PC. A simple serial interface allows the user to construct a hardware demultiplexer for the LCD signals.

## 8.10 MPLAB Integrated Development Environment Software

The MPLAB IDE Software brings an ease of software development previously unseen in the 8-bit microcontroller market. MPLAB is a windows based application which contains:

- · A full featured editor
- · Three operating modes
  - editor
  - emulator
  - simulator
- · A project manager
- · Customizable tool bar and key mapping
- A status bar with project information
- · Extensive on-line help

### MPLAB allows you to:

- Edit your source files (either assembly or 'C')
- One touch assemble (or compile) and download to PICmicro tools (automatically updates all project information)
- · Debug using:
  - source files
  - absolute listing file

The ability to use MPLAB with Microchip's simulator allows a consistent platform and the ability to easily switch from the low cost simulator to the full featured emulator with minimal retraining due to development tools.

## 8.11 <u>Assembler (MPASM)</u>

The MPASM Universal Macro Assembler is a PC-hosted symbolic assembler. It supports all microcontroller series including the PIC12C5XX, PIC14000, PIC16C5X, PIC16CXXX, and PIC17CXX families.

MPASM offers full featured Macro capabilities, conditional assembly, and several source and listing formats. It generates various object code formats to support Microchip's development tools as well as third party programmers.

MPASM allows full symbolic debugging from MPLAB-ICE, Microchip's Universal Emulator System.

MPASM has the following features to assist in developing software for specific use applications.

- Provides translation of Assembler source code to object code for all Microchip microcontrollers.
- · Macro assembly capability.
- Produces all the files (Object, Listing, Symbol, and special) required for symbolic debug with Microchip's emulator systems.
- Supports Hex (default), Decimal and Octal source and listing formats.

MPASM provides a rich directive language to support programming of the PICmicro. Directives are helpful in making the development of your assemble source code shorter and more maintainable.

## 8.12 <u>Software Simulator (MPLAB-SIM)</u>

The MPLAB-SIM Software Simulator allows code development in a PC host environment. It allows the user to simulate the PICmicro series microcontrollers on an instruction level. On any given instruction, the user may examine or modify any of the data areas or provide external stimulus to any of the pins. The input/output radix can be set by the user and the execution can be performed in; single step, execute until break, or in a trace mode.

MPLAB-SIM fully supports symbolic debugging using MPLAB-C17 and MPASM. The Software Simulator offers the low cost flexibility to develop and debug code outside of the laboratory environment making it an excellent multi-project software development tool.

## 8.13 MPLAB-C17 Compiler

The MPLAB-C17 Code Development System is a complete ANSI 'C' compiler and integrated development environment for Microchip's PIC17CXXX family of microcontrollers. The compiler provides powerful integration capabilities and ease of use not found with other compilers.

For easier source level debugging, the compiler provides symbol information that is compatible with the MPLAB IDE memory display.

## 8.14 <u>Fuzzy Logic Development System</u> (fuzzyTECH-MP)

fuzzyTECH-MP fuzzy logic development tool is available in two versions - a low cost introductory version, MP Explorer, for designers to gain a comprehensive working knowledge of fuzzy logic system design; and a full-featured version, fuzzyTECH-MP, Edition for implementing more complex systems.

Both versions include Microchip's *fuzzy*LAB™ demonstration board for hands-on experience with fuzzy logic systems implementation.

## 8.15 <u>SEEVAL® Evaluation and Programming System</u>

The SEEVAL SEEPROM Designer's Kit supports all Microchip 2-wire and 3-wire Serial EEPROMs. The kit includes everything necessary to read, write, erase or program special features of any Microchip SEEPROM product including Smart Serials™ and secure serials. The Total Endurance™ Disk is included to aid in trade-off analysis and reliability calculations. The total kit can significantly reduce time-to-market and result in an optimized system.

## 8.16 <u>KeeLoq® Evaluation and</u> <u>Programming Tools</u>

KEELOQ evaluation and programming tools support Microchips HCS Secure Data Products. The HCS evaluation kit includes an LCD display to show changing codes, a decoder to decode transmissions, and a programming interface to program test transmitters.

**NOTES:** 

## 9.0 ELECTRICAL CHARACTERISTICS FOR PIC16F84A

## **Absolute Maximum Ratings †**

| <u> </u>                                                                     |                      |
|------------------------------------------------------------------------------|----------------------|
| Ambient temperature under bias                                               |                      |
| Storage temperature                                                          | 65°C to +150°C       |
| Voltage on any pin with respect to Vss (except VDD, MCLR, and RA4)           | 0.3V to (VDD + 0.3V) |
| Voltage on VDD with respect to Vss                                           | 0.3 to +7.5V         |
| Voltage on MCLR with respect to Vss <sup>(1)</sup>                           | 0.3 to +14V          |
| Voltage on RA4 with respect to Vss                                           | 0.3 to +8.5V         |
| Total power dissipation <sup>(2)</sup>                                       | 800 mW               |
| Maximum current out of Vss pin                                               |                      |
| Maximum current into VDD pin                                                 |                      |
| Input clamp current, IiK (VI < 0 or VI > VDD)                                | ±20 mA               |
|                                                                              |                      |
| Output clamp current, lok (Vo < 0 or Vo > VDD)                               | 25 mA                |
| Maximum output current sourced by any I/O pin                                | 20 mA                |
| Maximum output current sourced by any I/O pin  Maximum current sunk by PORTA | Am 08                |
| Maximum current sourced by PORTA                                             |                      |
| Maximum current sunk by PORTB                                                | 150 mA               |
| Maximum current sourced by PORTB                                             | \ \ \                |

Note 1: Voltage spikes below Vss at the  $\overline{MCLR}$  pin, inducing currents greater than 80 mA, may cause latch-up. Thus, a series resistor of 50-100 $\Omega$  should be used when applying a "low" level to the  $\overline{MCLR}$  pin rather than pulling this pin directly to Vss.

**Note 2:** Power dissipation is calculated as follows: Pdis  $\sqrt[4]{VDQ} \times \sqrt[4]{RD} \times \sqrt[4]{DD} \times \sqrt[4]$ 

† NOTICE: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

|                        |               |                                                                  |          | 1    | 25*  | þΑ    | WDTE bit set, VDD = 4.0V, extended                                                                                            |

- \* These parameters are characterized but not tested.
- † Data in "Typ" column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.
- Note 1: This is the limit to which Von can be lowered without losing RAM data.
  - 2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern, and temperature also have an impact on the current consumption.
    - The test conditions for all Jod measurements in active operation mode are:
    - OSC1=external square wave, from rail to rail; all I/O pins tristated, pulled to VDD, TOCKI = VDD, MCLR = VDD; WDT enabled/disabled as specified.
  - 3: The power down current in SLEEP mode does not depend on the oscillator type. Power-down current is measured with the part in SLEEP mode, with all I/O pins in hi-impedance state and tied to VDD and Vss.
  - 4: For RC osc configuration, current through Rext is not included. The current through the resistor can be estimated by the formula IR = VDD/2Rext (mA) with Rext in kOhm.
  - 5: The \( \Delta\) current is the additional current consumed when this peripheral is enabled. This current should be added to the base IDD measurement.

### 9.5.2 TIMING CONDITIONS

The temperature and voltages specified in Table 9-2 apply to all timing specifications unless otherwise noted. All timings are measure between high and low measurement points as indicated in Figure 9-1. Figure 9-2 specifies the load conditions for the timing specifications.

These parameters are characterized but no tested.

<sup>†</sup> Data in "Typ" column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: Instruction cycle period (TCY) equals four times the input oscillator time-base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min." values with an external clock applied to the OSC1 pin. When an external clock input is used, the "Max." cycle time limit is "DC" (no clock) for all devices.

## 11.0 PACKAGING INFORMATION

#### 11.1 **Package Marking Information**

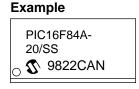

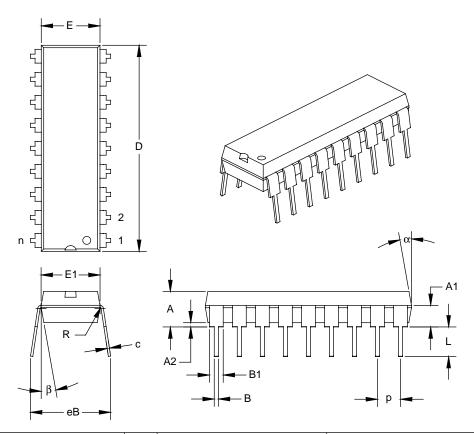

| Legend | MMM :b     | Microchip part number information                                        |
|--------|------------|--------------------------------------------------------------------------|
|        | XXX        | Customer specific information*                                           |
|        | AA         | Year code (last 2 digits of calendar year)                               |
|        | BB         | Week code (week of January 1 is week '01')                               |
|        | С          | Facility code of the plant at which wafer is manufactured                |
|        |            | O = Outside Vendor                                                       |
|        |            | C = 5" Line                                                              |
|        |            | S = 6" Line                                                              |
|        |            | H = 8" Line                                                              |
|        | D          | Mask revision number                                                     |
|        | E          | Assembly code of the plant or country of origin in which                 |
|        |            | part was assembled                                                       |
| Note:  | In the eve | nt the full Microchip part number cannot be marked on one line, it will  |
|        | be carried | d over to the next line thus limiting the number of available characters |

for customer specific information.

Standard OTP marking consists of Microchip part number, year code, week code, facility code, mask rev#, and assembly code. For OTP marking beyond this, certain price adders apply. Please check with your Microchip Sales Office. For QTP devices, any special marking adders are included in QTP price.

<sup>\*</sup> Controlling Parameter.

. ..

<sup>&</sup>lt;sup>†</sup> Dimension "B" does not include dam-bar protrusions. Dam-bar protrusions shall not exceed 0.003" (0.076 mm) per side or 0.006" (0.152 mm) more than dimension "B."

<sup>&</sup>lt;sup>‡</sup> Dimensions "D" and "E" do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010" (0.254 mm) per side or 0.020" (0.508 mm) more than dimensions "D" or "E."

## **APPENDIX A: REVISION HISTORY**

| Version | Date    | Revision Description                                                                                                                                            |
|---------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A       | 9/14/98 | This is a new data sheet. However, the devices described in this data sheet are the upgrades to the devices found in the <i>PIC16F8X Data Sheet</i> , DS30430C. |

## **APPENDIX B: CONVERSION CONSIDERATIONS**

Considerations for converting from one PIC16X8X device to another are listed in Table B-1.

TABLE B-1: CONVERSION CONSIDERATIONS - PIC16C84, PIC16F83/F84, PIC16CR83/CR84, PIC16F84A

| Difference                                                                                                           | PIC16C84                                                                                        | PIC16F83/F84                                                                                   | PIC16CR83/<br>CR84                                                                             | PIC16F84A                                                                                      |

NOTES:

## APPENDIX C: MIGRATION FROM BASELINE TO MIDRANGE DEVICES

This section discusses how to migrate from a baseline device (i.e., PIC16C5X) to a midrange device (i.e., PIC16CXXX).

The following is the list of feature improvements over the PIC16C5X microcontroller family:

- Instruction word length is increased to 14 bits.
   This allows larger page sizes both in program memory (2K now as opposed to 512 before) and the register file (128 bytes now versus 32 bytes before).
- A PC latch register (PCLATH) is added to handle program memory paging. PA2, PA1 and PA0 bits are removed from the status register and placed in the option register.
- Data memory paging is redefined slightly. The STATUS register is modified.
- Four new instructions have been added: RETURN, RETFIE, ADDLW, and SUBLW. Two instructions, TRIS and OPTION, are being phased out although they are kept for compatibility with PIC16C5X.
- OPTION and TRIS registers are made addressable.
- 6. Interrupt capability is added. Interrupt vector is at 0004h.
- 7. Stack size is increased to 8 deep.
- 8. Reset vector is changed to 0000h.
- Reset of all registers is revisited. Five different reset (and wake-up) types are recognized. Registers are reset differently.
- Wake up from SLEEP through interrupt is added.
- 11. Two separate timers, the Oscillator Start-up Timer (OST) and Power-up Timer (PWRT), are included for more reliable power-up. These timers are invoked selectively to avoid unnecessary delays on power-up and wake-up.
- 12. PORTB has weak pull-ups and interrupt on change features.
- 13. T0CKI pin is also a port pin (RA4/T0CKI).
- 14. FSR is a full 8-bit register.
- 15. "In system programming" is made possible. The user can program PIC16CXX devices using only five pins: VDD, VSS, VPP, RB6 (clock) and RB7 (data in/out).

To convert code written for PIC16C5X to PIC16F84A, the user should take the following steps:

- Remove any program memory page select operations (PA2, PA1, PA0 bits) for CALL, GOTO.
- Revisit any computed jump operations (write to PC or add to PC, etc.) to make sure page bits are set properly under the new scheme.
- 3. Eliminate any data memory page switching. Redefine data variables for reallocation.
- Verify all writes to STATUS, OPTION, and FSR registers since these have changed.
- 5. Change reset vector to 0000h.

## **ON-LINE SUPPORT**

Microchip provides on-line support on the Microchip World Wide Web (WWW) site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape or Microsoft Explorer. Files are also available for FTP download from our FTP site.

## Connecting to the Microchip Internet Web Site

The Microchip web site is available by using your favorite Internet browser to attach to:

### www.microchip.com

The file transfer site is available by using an FTP service to connect to:

## ftp://ftp.futureone.com/pub/microchip

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- · Design Tips
- Device Errata
- · Job Postings
- · Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- · Listing of seminars and events

## Systems Information and Upgrade Hot Line

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive any currently available upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and

1-602-786-7302 for the rest of the world.

980106

**Trademarks:** The Microchip name, logo, PIC, PICSTART, PICMASTER and PRO MATE are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries. PICmicro, *Flex*ROM, MPLAB and *fuzzy*LAB are trademarks and SQTP is a service mark of Microchip in the U.S.A.

All other trademarks mentioned herein are the property of their respective companies.

## **READER RESPONSE**

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (602) 786-7578.

Please list the following information, and use this outline to provide us with your comments about this Data Sheet.

## WORLDWIDE SALES AND SERVICE

#### **AMERICAS**

### **Corporate Office**

Microchip Technology Inc. 2355 West Chandler Blvd. Chandler, AZ 85224-6199 Tel: 480-786-7200 Fax: 480-786-7277 Technical Support: 480-786-7627 Web Address: http://www.microchip.com

#### **Atlanta**

Microchip Technology Inc. 500 Sugar Mill Road, Suite 200B Atlanta, GA 30350

Tel: 770-640-0034 Fax: 770-640-0307

### **Boston**

Microchip Technology Inc. 5 Mount Royal Avenue Marlborough, MA 01752 Tel: 508-480-9990 Fax: 508-480-8575

### Chicago

Microchip Technology Inc. 333 Pierce Road, Suite 180 Itasca, IL 60143

Tel: 630-285-0071 Fax: 630-285-0075

## **Dallas**

Microchip Technology Inc. 4570 Westgrove Drive, Suite 160 Addison, TX 75248 Tel: 972-818-7423 Fax: 972-818-2924

### Dayton

Microchip Technology Inc. Two Prestige Place, Suite 150 Miamisburg, OH 45342 Tel: 937-291-1654 Fax: 937-291-9175

## Detroit

Microchip Technology Inc. Tri-Atria Office Building 32255 Northwestern Highway, Suite 190 Farmington Hills, MI 48334 Tel: 248-538-2250 Fax: 248-538-2260

### Los Angeles

Microchip Technology Inc. 18201 Von Karman, Suite 1090 Irvine, CA 92612 Tel: 949-263-1888 Fax: 949-263-1338

### **New York**

Microchip Technology Inc. 150 Motor Parkway, Suite 202 Hauppauge, NY 11788 Tel: 631-273-5305 Fax: 631-273-5335

### San Jose

Microchip Technology Inc. 2107 North First Street, Suite 590 San Jose, CA 95131 Tel: 408-436-7950 Fax: 408-436-7955

#### AMERICAS (continued)

Microchip Technology Inc. 5925 Airport Road, Suite 200 Mississauga, Ontario L4V 1W1, Canada Tel: 905-405-6279 Fax: 905-405-6253

## ASIA/PACIFIC

#### Hong Kong

Microchip Asia Pacific Unit 2101, Tower 2 Metroplaza 223 Hing Fong Road Kwai Fong, N.T., Hong Kong Tel: 852-2-401-1200 Fax: 852-2-401-3431

#### Beijing

Microchip Technology, Beijing Unit 915, 6 Chaoyangmen Bei Dajie Dong Erhuan Road, Dongcheng District New China Hong Kong Manhattan Building Beijing 100027 PRC
Tel: 86-10-85282100 Fax: 86-10-85282104

#### India

Microchip Technology Inc. India Liaison Office No. 6, Legacy, Convent Road Bangalore 560 025, India Tel: 91-80-229-0061 Fax: 91-80-229-0062

## Japan

Microchip Technology Intl. Inc. Benex S-1 6F 3-18-20, Shinyokohama Kohoku-Ku, Yokohama-shi Kanagawa 222-0033 Japan Tel: 81-45-471- 6166 Fax: 81-45-471-6122

### Korea

Microchip Technology Korea 168-1, Youngbo Bldg. 3 Floor Samsung-Dong, Kangnam-Ku Seoul, Korea Tel: 82-2-554-7200 Fax: 82-2-558-5934

### Shanghai

Microchip Technology RM 406 Shanghai Golden Bridge Bldg. 2077 Yan'an Road West, Hong Qiao District Shanghai, PRC 200335 Tel: 86-21-6275-5700 Fax: 86 21-6275-5060

## Italy

Arizona Microchip Technology SRL Centro Direzionale Colleoni Palazzo Taurus 1 V. Le Colleoni 1 20041 Agrate Brianza Milan, Italy Tel: 39-039-65791-1 Fax: 39-039-6899883

Microchip received QS-9000 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona in July 1999. The Company's quality system processes and procedures are QS-9000 compliant for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs and microperipheral products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001 certified.
