# LM340/LM78XX Series 3-Terminal Positive Regulators

### **General Description**

The LM140/LM340A/LM340/LM78XXC monolithic 3-terminal positive voltage regulators employ internal current-limiting, thermal shutdown and safe-area compensation, making them essentially indestructible. If adequate heat sinking is provided, they can deliver over 1.0A output current. They are intended as fixed voltage regulators in a wide range of applications including local (on-card) regulation for elimination of noise and distribution problems associated with single-point regulation. In addition to use as fixed voltage regulators, these devices can be used with external components to obtain adjustable output voltages and currents.

Considerable effort was expended to make the entire series of regulators easy to use and minimize the number of external components. It is not necessary to bypass the output, although this does improve transient response. Input bypassing is needed only if the regulator is located far from the filter capacitor of the power supply.

The 5V, 12V, and 15V regulator options are available in the steel TO-3 power package. The LM340A/LM340/LM78XXC series is available in the TO-220 plastic power package, and the LM340-5.0 is available in the SOT-223 package, as well as the LM340-5.0 and LM340-12 in the surface-mount TO-263 package.

#### **Features**

- Complete specifications at 1A load
- Output voltage tolerances of ±2% at T<sub>j</sub> = 25°C and ±4% over the temperature range (LM340A)
- Line regulation of 0.01% of V<sub>OUT</sub>/V of ΔV<sub>IN</sub> at 1A load (LM340A)
- Load regulation of 0.3% of V<sub>OUT</sub>/A (LM340A)
- Internal thermal overload protection
- Internal short-circuit current limit
- Output transistor safe area protection
- P<sup>+</sup> Product Enhancement tested

## **Typical Applications**

#### **Fixed Output Regulator**

00778101

#### Adjustable Output Regulator

 $V_{OUT} = 5V + (5V/R1 + I_Q) R2 5V/R1 > 3 I_Q,$ load regulation (L<sub>r</sub>)  $\approx$  [(R1 + R2)/R1] (L<sub>r</sub> of LM340-5).

#### **Current Regulator**

 $I_{OUT} = \frac{V2-3}{B1} + I_{Q}$ 

 $\Delta I_Q = 1.3 \text{ mA over line and load changes.}$ 

# Comparison between SOT-223 and D-Pak (TO-252) Packages

Scale 1:1

<sup>\*</sup>Required if the regulator is located far from the power supply filter.

<sup>\*\*</sup>Although no output capacitor is needed for stability, it does help transient response. (If needed, use 0.1 µF, ceramic disc).

**Note 1:** Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Conditions are conditions under which the device functions but the specifications might not be guaranteed. For guaranteed specifications and test conditions see the Electrical Characteristics.

Note 2: The maximum allowable power dissipation at any ambient temperature is a function of the maximum junction temperature for operation ( $T_{JMAX} = 125^{\circ}C$  or 150°C), the junction-to-ambient thermal resistance ( $\theta_{JA}$ ), and the ambient temperature ( $T_A$ ).  $P_{DMAX} = (T_{JMAX} - T_A)/\theta_{JA}$ . If this dissipation is exceeded, the die temperature will rise above  $T_{JMAX}$  and the electrical specifications do not apply. If the die temperature rises above 150°C, the device will go into thermal shutdown. For the TO-3 package (K, KC), the junction-to-ambient thermal resistance ( $\theta_{JC}$ ) of the TO-3 package and the case-to-ambient thermal resistance of the heatsink. For the TO-220 package (T),  $\theta_{JA}$  is  $54^{\circ}C/W$  and  $\theta_{JC}$  is  $4^{\circ}C/W$ . If SOT-223 is used, the junction-to-ambient thermal resistance is  $174^{\circ}C/W$  and can be reduced by a heatsink (see Applications Hints on heatsinking).

If the TO-263 package is used, the thermal resistance can be reduced by increasing the PC board copper area thermally connected to the package: Using 0.5 square inches of copper area,  $\theta_{JA}$  is 50°C/W; with 1 square inch of copper area,  $\theta_{JA}$  is 32°C/W.

Note 3: ESD rating is based on the human body model, 100 pF discharged through 1.5 k $\Omega$ .

Note 4: All characteristics are measured with a 0.22  $\mu$ F capacitor from input to ground and a 0.1  $\mu$ F capacitor from output to ground. All characteristics except noise voltage and ripple rejection ratio are measured using pulse techniques ( $t_w \le 10$  ms, duty cycle  $\le 5\%$ ). Output voltage changes due to changes in internal temperature must be taken into account separately.

**Note 5:** Military datasheets are available upon request. At the time of printing, the military datasheet specifications for the LM140K-5.0/883, LM140K-12/883, and LM140K-15/883 complied with the min and max limits for the respective versions of the LM140. The LM140H and LM140K may also be procured as JAN devices on slash sheet JM38510/107.

## **Equivalent Schematic**

#### **Application Hints**

The LM340/LM78XX series is designed with thermal protection, output short-circuit protection and output transistor safe area protection. However, as with *any* IC regulator, it becomes necessary to take precautions to assure that the regulator is not inadvertently damaged. The following describes possible misapplications and methods to prevent damage to the regulator.

#### SHORTING THE REGULATOR INPUT

When using large capacitors at the output of these regulators, a protection diode connected input to output (Figure~1) may be required if the input is shorted to ground. Without the protection diode, an input short will cause the input to rapidly approach ground potential, while the output remains near the initial  $V_{\text{OUT}}$  because of the stored charge in the large output capacitor. The capacitor will then discharge through a large internal input to output diode and parasitic transistors. If the energy released by the capacitor is large enough, this diode, low current metal and the regulator will be destroyed. The fast diode in Figure~1~ will shunt most of the capacitors discharge current around the regulator. Generally no protection diode is required for values of output capacitance  $\leq 10~$  u.E.

# RAISING THE OUTPUT VOLTAGE ABOVE THE INPUT VOLTAGE

Since the output of the device does not sink current, forcing the output high can cause damage to internal low current paths in a manner similar to that just described in the "Shorting the Regulator Input" section.

#### **REGULATOR FLOATING GROUND (Figure 2)**

When the ground pin alone becomes disconnected, the output approaches the unregulated input, causing possible damage to other circuits connected to  $V_{\rm OUT}$ . If ground is reconnected with power "ON", damage may also occur to the regulator. This fault is most likely to occur when plugging in regulators or modules with on card regulators into powered up sockets. Power should be turned off first, thermal limit ceases operating, or ground should be connected first if power must be left on.

#### TRANSIENT VOLTAGES

If transients exceed the maximum rated input voltage of the device, or reach more than 0.8V below ground and have sufficient energy, they will damage the regulator. The solution is to use a large input capacitor, a series input breakdown diode, a choke, a transient suppressor or a combination of these.

FIGURE 1. Input Short

FIGURE 2. Regulator Floating Ground

FIGURE 3. Transients

When a value for  $\theta_{(H-A)}$  is found using the equation shown, a heatsink must be selected that has a value that is less than or equal to this number.

 $\theta_{(H-A)}$  is specified numerically by the heatsink manufacturer in this catalog, or shown in a curve that plots temperature rise vs power dissipation for the heatsink.

#### Application Hints (Continued)

#### **HEATSINKING TO-263 AND SOT-223 PACKAGE PARTS**

Both the TO-263 ("S") and SOT-223 ("MP") packages use a copper plane on the PCB and the PCB itself as a heatsink. To optimize the heat sinking ability of the plane and PCB, solder the tab of the plane.

shows for the TO-263 the measured values of  $\theta_{(J-A)}$  for different copper area sizes using a typical PCB with 1 ounce copper and no solder mask over the copper area used for heatsinking.

FIGURE 4.  $\theta_{(J-A)}$  vs Copper (1 ounce) Area for the TO-263 Package

As shown in the figure, increasing the copper area beyond 1 square inch produces very little improvement. It should also be observed that the minimum value of  $\theta_{(J-A)}$  for the TO-263 package mounted to a PCB is 32°C/W.

As a design aid, *Figure 5* shows the maximum allowable power dissipation compared to ambient temperature for the TO-263 device (assuming  $\theta_{(J-A)}$  is 35°C/W and the maximum junction temperature is 125°C).

FIGURE 5. Maximum Power Dissipation vs  $\rm T_{AMB}$  for the TO-263 Package

Figures 6, 7 show the information for the SOT-223 package. Figure 6 assumes a  $\theta_{(J-A)}$  of 74°C/W for 1 ounce copper and 51°C/W for 2 ounce copper and a maximum junction temperature of 125°C.

FIGURE 6.  $\theta_{(J-A)}$  vs Copper (2 ounce) Area for the SOT-223 Package

FIGURE 7. Maximum Power Dissipation vs  $T_{\rm AMB}$  for the SOT-223 Package

Please see AN-1028 for power enhancement techniques to be used with the SOT-223 package.

# **Typical Applications**

#### **Fixed Output Regulator**

Note: Bypass capacitors are recommended for optimum stability and transient response, and should be located as close as possible to the regulator.

#### **High Input Voltage Circuits**

00778114

#### **High Current Voltage Regulator**

00778116

$$\beta(Q1) \ge \frac{IO Max}{I_{REG Max}}$$

$$R1 = \frac{0.9}{I_{REG}} = \frac{\beta(Q1) V_{BE(Q1)}}{I_{REG Max} (\beta + 1) - I_{O Max}}$$

13

# Typical Applications (Continued)

#### High Output Current, Short Circuit Protected

$$R_{SC} = \frac{0.8}{I_{SC}}$$

$$R1 = \frac{\beta V_{BE(Q1)}}{I_{REG Max} (\beta + 1) - I_{O Max}}$$

#### **Positive and Negative Regulator**

#### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

- 1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- 2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

#### **BANNED SUBSTANCE COMPLIANCE**

National Semiconductor certifies that the products and packing materials meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
