Functional Description^[2]

The CY62148EV30 is a high performance CMOS static RAM organized as 512K words by 8 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life[™] (MoBL[®]) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption. Placing the device into standby mode reduces power consumption by more than 99% when deselected (\overline{CE} HIGH). The eight input and output pins (IO_0 through IO_7) are placed in a high impedance state when the device is deselected (\overline{CE} HIGH), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE} LOW and \overline{WE} LOW).

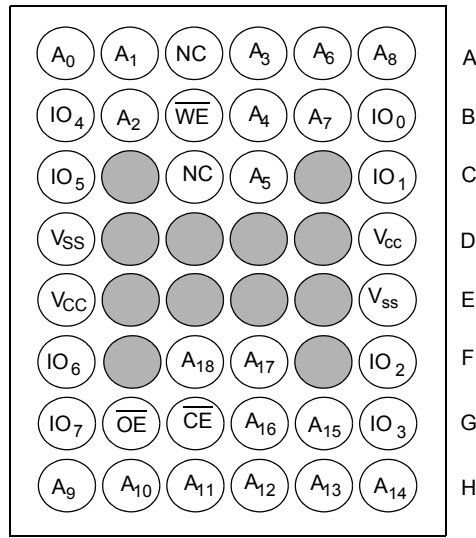

To write to the device, take Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. Data on the eight IO pins (IO_0 through IO_7) is then written into the location specified on the address pins (A_0 through A_{18}).

To read from the device, take Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) LOW while forcing Write Enable (\overline{WE}) HIGH. Under these conditions, the contents of the memory location specified by the address pins appear on the IO pins.

Notes

- $V_{IL(min)}$ = -2.0V for pulse durations less than 20 ns.
- $V_{IH(max)}$ = $V_{CC} + 0.75$ V for pulse durations less than 20 ns.
- Full device AC operation assumes a minimum of 100 μ s ramp time from 0 to $V_{CC(min)}$ and 200 μ s wait time after V_{CC} stabilization.
- Under DC conditions the device meets a V_{IL} of 0.8V (for V_{CC} range of 2.7V to 3.6V) and 0.6V (for V_{CC} range of 2.2V to 2.7V). However, in dynamic conditions Input LOW voltage applied to the device must not be higher than 0.6V and 0.4V for the above ranges. This is applicable to SOIC package only. Please refer to AN13470 for details.
- Only chip enable (\overline{CE}) must be HIGH at CMOS level to meet the I_{SB2} / I_{CCDR} spec. Other inputs can be left floating.

Notes

- 10. Tested initially and after any design or process changes that may affect these parameters.

Notes

12. Test Conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns or less (1 V/ns), timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in the "AC Test Loads and Waveforms" on page 4.
13. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
14. t_{HZOE} , t_{HZCE} , and t_{HZWE} transitions are measured when the output enter a high impedance state.
15. The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE} = V_{IL}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

Switching Waveforms

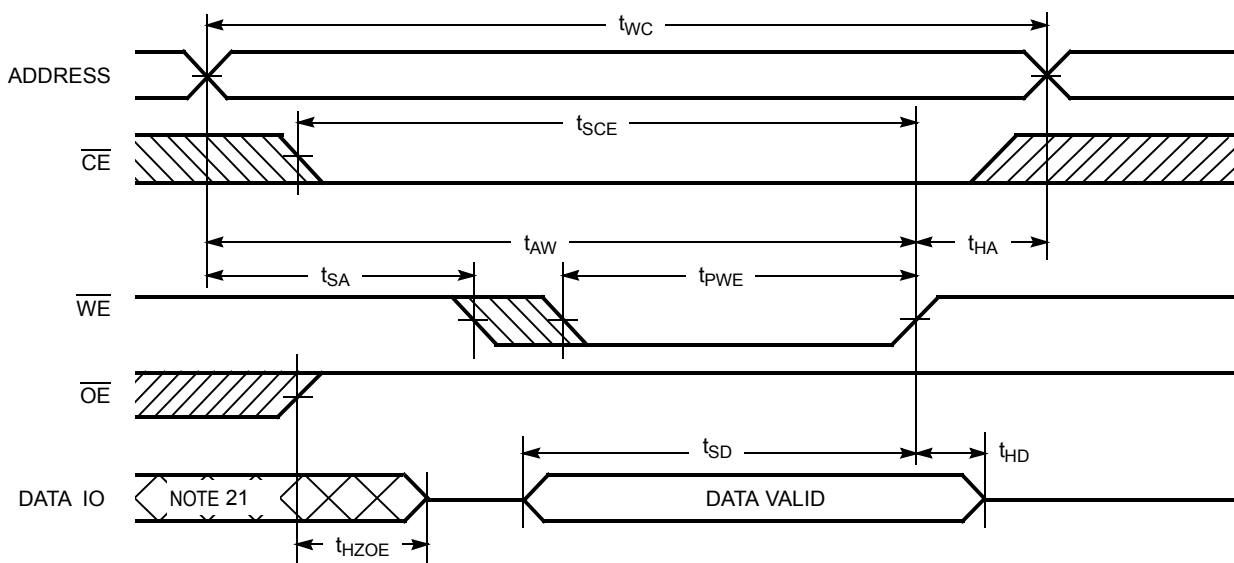

Read Cycle No. 1 (Address Transition Controlled) [16, 17]

Read Cycle No. 2 (\overline{OE} Controlled) [17, 18]

Write Cycle No. 1 (\overline{WE} Controlled, \overline{OE} HIGH During Write) [19, 20]

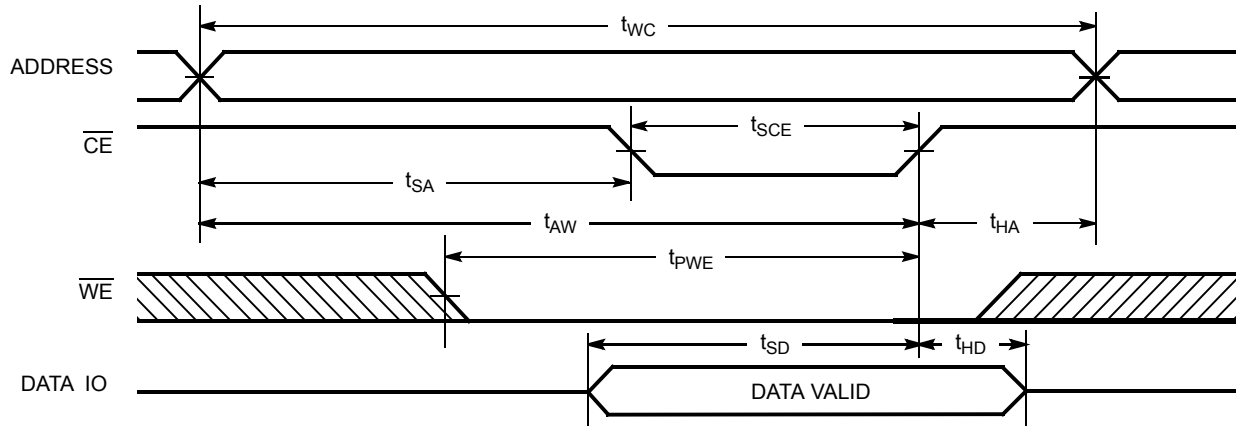

Notes

- 16. Device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$.
- 17. WE is HIGH for read cycles.
- 18. Address valid before or similar to \overline{CE} transition LOW.
- 19. Data IO is high impedance if $\overline{OE} = V_{IH}$.
- 20. If CE goes HIGH simultaneously with WE HIGH, the output remains in high impedance state.
- 21. During this period, the IOs are in output state. Do not apply input signals.
