

# GM6250

## ULTRA - LOW DROPOUT POSITIVE VOLTAGE REGULATOR

Power Management

### Description

The GM6250's combine high accuracy with very low power consumption, providing high output current even when the application requires extremely low input-output voltage differential.

The GM6250's include a precision voltage reference, an error correction circuit, over-temperature protection, and a current limited output driver. Fast transient response to load variations provides excellent stability under dynamic load conditions.

The GM6250's come in SOT-23 (150mW), SOT-89 (500mW) and TO-92 packages.

### Features

- ◆ Maximum output current 250mA (within maximum power dissipation)
- ◆ Output voltage: from 1.8 V to 6.0V in 0.1V increments
- ◆ Output voltage  $\pm 2\%$
- ◆ CMOS low power consumption, typically 1.0 $\mu$ A at  $V_{OUT} = 5.0V$
- ◆ Input stability typically 0.2%/ $V$
- ◆ Ultra-low dropout voltage 0.38V @  $I_{OUT} = 200mA$  at  $V_{OUT} = 5.0V$
- ◆ Small input/ output differential: 0.4V at 160mA ( $V_{OUT} = 3.3V$ )
- ◆ SOT-23 (150mW), SOT-89 (500mW) and TO-92 packages

### Application

**Palmtops****Portable Cameras****Video Recorders****Battery Powered Equipment****Reference Voltage Sources**

### TYPICAL APPLICATION CIRCUITS

Note: 1.  $V_{OUT}(T)$  = Specified Output Voltage

2.  $V_{OUT}(E)$  = Effective Output Voltage (the output voltage when " $V_{OUT}(T) + 1.0\text{V}$ " is provided at the  $V_{IN}$  pin while maintaining a certain  $I_{OUT}$  value)

3.  $V_{dif} = \{V_{IN1} (\text{Note 4}) - V_{OUT} (E)\}$

4.  $V_{IN1}$  = The input voltage at the time 98% of  $V_{OUT}(E)$  is output (input voltage has been gradually reduced).

\* Output Voltage from 1.8V to 6.0V in 0.1V increments are available

## ◆ DIRECTIONS FOR USE

### Notes on Use

1. Please use this IC within the stipulated absolute maximum ratings as the IC is liable to malfunction outside of such parameters.
2. There is a possibility that oscillation may occur as a result of the impedance present between the power supply and the IC's input. Where impedance is 10  $\Omega$  or more, please use a capacitor ( $C_{IN}$ ) of at least 1  $\mu F$ . With a large output current, operations can be stabilised by increasing capacitor size ( $C_{IN}$ ). If  $C_{IN}$  is small and capacitor size ( $C_L$ ) is increased, there is a possibility of oscillation due to input impedance. In such cases, operations can be stabilised by either increasing the size of  $C_{IN}$  or decreasing the size of  $C_L$ .
3. Please ensure that output current ( $I_{OUT}$ ) is less than  $P_d \div (V_{IN} - V_{OUT})$  and does not exceed the stipulated continuous total power dissipation value ( $P_d$ ) for the package.
