

ADVANCED INFORMATION

AIC1595

2A STEP-DOWN PWM REGULATOR

SPEC NO: DS-1595-P1 03/23/00

FEATURES

- Operating Input Voltage From 4.5V to 36V
- 2.5V, 3.3V, 5V, 12V and Adjustable Output Version
- Adjustable Version Output Voltage Range, 1.25V to 30V $\pm 4\%$ max Over Line and Load Regulation
- Available in TO220-5 and TO263-5 Package
- Requires Only 4 External Components.
- 150KHz/300KHz Fixed Constant Frequency
- Low Power Standby Mode, I_Q Typically 80 μ A
- TTL Shutdown Capability.
- Output Overvoltage Protection
- Current Limit and Thermal Shutdown Protection.
- 2A Guaranteed Output Current

APPLICATIONS

- Simple High Efficiency Step-down regulator
- On-Card Switching regulators
- Fixed Voltage power supply for LCD Monitor

DESCRIPTION

The AIC1595 series are step-down monolithic PWM regulators delivering 2A at fixed voltages of 2.5V, 3.3V, 5.0V, 12V and using an external divider to adjust output voltage from 1.25V to 30V with excellent line and load regulation.

Switching frequency up to 150KHz/300KHz are achievable thus allowing smaller sized filter components. Internal current limit and thermal shut-down circuits provide protection from overloads. It also provides output overvoltage and short protection under fault conditions.

The internal precision reference combined with voltage feedback loop provides optimum output voltage accuracy and fast load transient response.

Packages available are in standard TO220-5 for standard assembly and TO263-5 for SMD.

PIN DESCRIPTIONS

PIN 1: IN	Supply voltage input for the IC switching regulator. A suitable input bypass capacitor must be present at this pin to minimize voltage transients and to supply the switching currents needed by the regulator.	PIN 4: FB	Feedback input for fixed-output or adjustable-output version. Connect directly to output for fixed operation version or to a resistor divider for adjustable operation versions.
PIN 2: OUT	Internal switch. The voltage at this pin switches between ($V_{IN}-V_{SAT}$) and approximately $-0.5V$, with a duty cycle of approximately V_{OUT}/V_{IN} .	PIN 5: SHDN	Allows the switching regulator circuit to be shutdown using logic level signals thus dropping the total input supply current to approximately $80\mu A$. Drive it high to disable the reference, control circuitry and internal switches. Drive low or connect to GND for normal operation.
PIN 3: GND	Ground requires a short, low noise connection to ensure good load regulation.
