

STV0030

## SATELLITE SOUND AND VIDEO PROCESSOR

- TWO INDEPENDENTLY PROGRAMMABLE SOUND DEMODULATORS
- PLL DEMODULATION WITH 5-9MHz FREQUENCY SYNTHESIS
- 50/75 $\mu$ s, J17 OR NO DE-EMPHASIS PROGRAMMABLE OPTIONS
- DYNAMIC NOISE REDUCTION SYSTEM
- FIXED LEVEL AUXILIARY AUDIO INPUTS AND OUTPUTS
- VOLUME CONTROLLED AND MUTEABLE AUDIO OUTPUTS
- COMPOSITE VIDEO 6-BIT GAIN CONTROL
- COMPOSITE VIDEO SELECTABLE INVERTER
- COMPOSITE VIDEO DEEMPHASIS AMPLIFIER
- 9 x 5 VIDEO MATRIX AND SWITCHES WITH GRAPHICS INPUT
- 8-BIT DAC OUTPUT
- FULLY CONTROLLED VIA I<sup>2</sup>C BUS
- TWO HARDWARE SELECTABLE ADDRESSES (06<sub>HEX</sub> and 46<sub>HEX</sub>)

PQFP64  
(Plastic Package)

ORDER CODE : STV0030

### DESCRIPTION

The STV0030 is a BICMOS integrated circuit for use in satellite receivers. The great variety of FM deviations, energy dispersal and subcarrier standards makes the design of satellite receivers able to receive all programs a complex task. The device has been designed to specially adapt to all known conditions in analog video and radio transmissions.

The choice of the surface mounting PQFP64 package ensures optimisation of real-estate requirements.

## PIN CONNECTIONS

0030-01 EPS

## PIN ASSIGNMENT

Pin	Name	Function
1	GND	Digital Power Ground
2	S3	SCART-3 Driver
3	S2	SCART-2 Driver
4	S1	SCART-1 Driver
5	SYNCIN	Digital or Analog Sync Signal Input
6	AUXOUT1	Fixed Level Audio Output Left
7	AUXOUT2	Fixed Level Audio Output Right
8	HA	Hardware Address
9	IO1	Digital Input/Output 1
10	IO2	Digital Input/Output 2
11	VDD	Digital 5V Power Supply
12	XTL	4/8MHz Clock Input (optionally 4/8MHz Quartz Crystal)
13	RESET	System Reset
14	TEST	Test Pin
15	DAOUT	DAC Amplifier Output
16	AUXIN1	Auxilliary Audio Input Left
17	U751	75µs De-emphasis Time Constant Left

0030-01 TBL

## PIN ASSIGNMENT

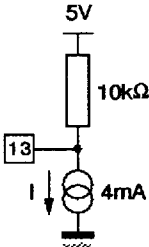

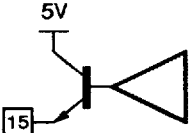

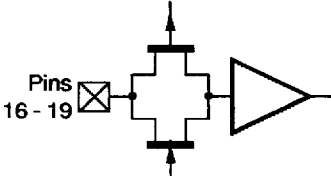

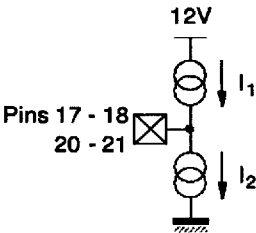

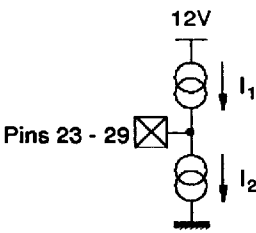

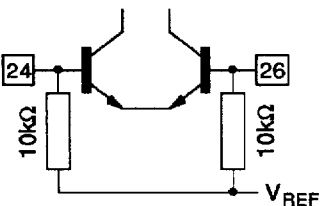

Pin	Name	Function
18	J171	J17 De-emphasis Time Constant Left
19	AUXIN2	Auxiliary Audio Input Right
20	U752	75 $\mu$ s De-emphasis Time Constant Right
21	J172	J17 De-emphasis Time Constant Right
22	GND	RF and Audio Ground
23	DET1	FM PLL Filter Left
24	FMIN1	FM Demodulator +ve Input
25	AGC1	AGC Peak Detect Capacitor Left
26	FMIN2	FM Demodulator -ve Input
27	V <sub>REF</sub>	2.44V Reference
28	V <sub>CC</sub>	Audio 12V Supply
29	DET2	FM PLL Filter Right
30	AMPLOCK1	Amplitude Detector Capacitor Left
31	CPUMP1	FM PLL Charge Pump Capacitor Left
32	AGC2	AGC Peak Detect Capacitor Right
33	GND	Ground for Volume Control ANRS, VCO
34	AMPLOCK2	Amplitude Detector Capacitor Right
35	CPUMP2	FM PLL Charge Pump Capacitor Right
36	I <sub>REF</sub>	Current Reference Resistor
37	PEAKOUT	ANRS Peak Detector Capacitor
38	FCLEFT	Audio Roll-off Left
39	PEAKIN	ANRS Peak Detector Input
40	SUMOUT	ANRS Summing Output
41	FCRIGHT	Audio Roll-off Right
42	AUDIOOUT2	Level Controlled Audio Out Right
43	AUDIOOUT1	Level Controlled Audio Out Left
44	DAIN	Digital/Analog Converter Sense Input
45	S2VIDIN	External Video Input 2
46	S1VIDIN	External Video Input 1
47	DEC1IN	Decoder 1 Input (e.g. D2MAC)
48	DEC2IN	Decoder 2 Input (e.g. Videocrypt)
49	VI5	Clamped Video Input
50	OSDIN	On-screen Display Video Input
51	S3VIDOUT	SCART-3 Video Output (with OSD)
52	S2VIDOUT	SCART-2 Video Output (with OSD)
53	S1VIDOUT	SCART-1 Video Output (without OSD)
54	DECOUT2	Satellite Decoder Drive 2
55	DECOUT1	Satellite Decoder Drive 1
56	V <sub>CC</sub>	Video 12V Supply
57	GND	Video Ground
58	CLAMPIN	Sync-tip Clamp Input
59	DEEMPHOUT	Video De-emphasis Output
60	DEEMPHIN	Video De-emphasis Input
61	VIDIN	Video Input Buffer
62	GND	Video Input Ground
63	SCL	I <sup>2</sup> C Bus Clock
64	SDA	I <sup>2</sup> C Bus Data

**PIN FUNCTION DESCRIPTION**

**1 - SCART DRIVERS WITH OSD**

'Text' must be able to be added to the video on command with or without 'blanking'. Blanking adds either a black line around the characters or a black box for the characters to sit in. During 'blanking' the chip will output OSD 'background' level.

There are 2 basic presentation modes of OSD 'text'.

- 1) OSD 'text' written on a blank screen of selectable brightness.
- 2) OSD 'text' written on top of the TV picture.

Additionally the OSD 'text' can be displayed with or without 'blanking'. The blanking from the microcontroller typically comes in two styles. Either as a line around characters or a box for the characters to sit in).

1 of 4 output levels from the SCART are required when using OSD. The diagram below shows part of a TV line displaying a small OSD. It starts with :

- a) a line sync pulse of  $5\mu s$  at 0V then,
- b)  $13\mu s$  at black level, followed by

- c)  $2\mu s$  at OSD 'background' level.
- d) This is the OSD 'text' which has been shown as  $2\mu s$  pulses going to peak white. These would be typically programmed to say 0.8V with the OSD 'background' at 0.3V (1.7V at matrix output).

In order to achieve this two DACs are used to generate the programmable voltage levels for OSD 'background' and 'text'.

The video outputs and terms are :

- i) Normal video
  - sync tips = +1.22V
  - black level = +1.7V
  - peak white = +3.1V

## ii) Video with OSD

Video with OSD

sync tips = +1.22V

black level = +1.7V

'background' level = +1.7V to 3.1V,  
programmable in 8 steps of 0.2V per step'text' = +3.1V to 1.7V, programmable in 8  
steps of 0.2V per stepiii) 'background' occurs during active video so  
whenever the micro generates 'blanking' it will  
force the SCART output to 'background' level  
(+1.7V to +3.1V).iv) 'text' occurs during active video so whenever  
OSD occurs the SCART output is forced to  
'peak white' (+3.1V to +1.6V). In fact the OSD  
'text' has higher priority than 'background' so  
gets applied to the signal stream after  
'background'.

Described above is an ideal situation with 2.0V<sub>PP</sub>  
video with the bottom of the sync pulses at 1.22V.  
However the actual voltage of the sync tips will vary  
because the video is AC coupled and the picture  
content will change. Thus, in order to apply the  
'blanking' or 'OSD' we need DC restored video the  
voltage of the sync tips are known and this is  
achieved by having 'DC level clamps' on all video  
input pins.

**Pin 2 S3**

This is the tri-stateable bi-directional SCART pin 8  
driver for SCART-3. Since SCART-1,2 & 3 can be  
either controller or receiver SCART pin 8 is either  
an output or input. Since some equipment does not  
follow the SCART spec fully, the micro has full  
control of these pins via bits in the 'control' block.

As input;  $Z_{IN} > 10k\Omega$   $< 2V = \text{logic } 0$ ,  $> 9.5V = \text{logic } 1$ As output; logic 0 outputs sink 1-3mA to gnd  
logic 1 outputs source 1-3mA from  
 $V_{CC}-1V$ **Pin 3 S2**

SCART-2 driver, same spec as pin 2.

**Pin 4 S1**

SCART-1 driver, same spec as pin 2.

**2 - CONTROL BLOCK**

This has an I<sup>2</sup>C bus 2 wire interface with the related  
registers. It also contains 2 bi-directional tri-state-  
able logic I/O drives.

**Pin 1 Ground**

The main power ground connection for the control  
logic, registers, the I<sup>2</sup>C bus interface, synthesiser

&amp; watchdog.

**Pin 8 HA**

For the I<sup>2</sup>C bus interface it is necessary to have a  
programmable bit on the address in case the chip  
address clashes with that of another chip in the  
application. CMOS input levels must be held high  
or low externally; 0 = 06h, 1 = 46h.

**Pin 9 IO1**

A general purpose I/O pin.

**Pin 10 IO2**

A general purpose I/O pin. It may alternatively be  
programmed via I<sup>2</sup>C bus to output an internally  
generated 20kHz squarewave for LNB control  
(ASTRA recommendation is 22kHz  $\pm$  4kHz).

**Pin 11 V<sub>DD</sub>**

Digital +5V power supply.

**Pin 63 SCL**

This is the I<sup>2</sup>C bus clock line. Clock = DC to 100kHz.  
Requires external pull up eg. 10k $\Omega$  to 5V.

**Pin 64 SDA**

This is the I<sup>2</sup>C bus data line. Requires external pull  
up eg. 10k $\Omega$  to 5V.

**3 - MISCELLANEOUS BITS****Pin 12 XTL**

This pin allows for the on-chip oscillator to be either  
used with a crystal to ground of 4MHz, or to be  
driven by an external source via a 22k $\Omega$  series  
resistor and 1nF series capacitor. This second  
option is recommended. The external source can  
be either 4MHz or 8MHz. A programmable bit in the  
control block removes a  $\div 2$  block when the 4MHz  
option is selected.

**Pin 13 RESET**

Power on reset output. This is a voltage sensitive  
circuit and will give a LOW output until both supplies  
to this chip rise to greater than 80% of their correct  
value. It has some hysteresis so will remain HIGH  
until either of the supplies falls below 65%. The  
output is a current sink, 2mA, with an internal 10k $\Omega$   
pull-up resistor. It is possible to force the chip into  
or out of reset and by pass the on-chip delay.

Typical thresholds are:

$V_{DD}=5V$	$V_{CC}=12V$
power up	3.8V 9.2V
power down	3.2V 7.5V

**Pin 14 TEST**

Test pin to enable scan path testing of logic.  
Normal operation = L Test mode = H  
It must be grounded for normal operation.

**Pin 15 DAOUT**

This is the LNB drive which is the output of an amplifier that compares the input on pin 44 with an 8-bit DAC. The DAC is programmed through the I<sup>2</sup>C bus interface to set the reference voltage for the LNB drive amplifier. The voltage range is 0 to 2.35 volts (2 bandgaps), hence the feedback signal must be divided down to be in this range. Pin 15 output current must be maintained lower than 2mA.

**Pin 44 DAIN**

The voltage actually fed to the LNB is divided down & connected here (feedback) for the on-chip regulator.

**4 - SOUND DETECTION BLOCK**

The different de-emphasis formats are selected through the audio MUX and are the same for both channels. That is, as with the volume control, the I<sup>2</sup>C bus registers simultaneously control both channels with each bit of registers.

**Pin 6 AUXOUT1 (LEFT)**

This audio output is sourced directly from the audio MUX, and as a result does not include any volume control function. It will output 1V<sub>PP</sub> biased at 2.35V with Z<sub>OUT</sub>=1k $\Omega$ . If SCART socket drive is needed then an external buffer will be required.

**Pin 7 AUXOUT2 (RIGHT)**

See pin 6.

**Pin 16 AUXIN1 (LEFT)**

This pin allows an auxiliary audio signal to be connected to the input of channel 1 audio processor and hence makes use of the on chip volume control. An on-board MAC decoder is a typical user of this feature. Needs to be externally biased to V<sub>REF</sub>.

**Pin 17 U751 (LEFT)**

A capacitor and resistor in parallel of 75 $\mu$ s time constant connected between here and V<sub>REF</sub> (pin 27) to provide 75 $\mu$ s de-emphasis for channel 1. Internally selectable is an internal resistor that can be programmed to be added in parallel thereby converting the network to approx 50 $\mu$ s

de-emphasis. The value of the internal resistor is 44k $\Omega$   $\pm$  30%. The amplifier for this filter is voltage input, current output; with  $\pm$  500mV input the output will be  $\pm$  55 $\mu$ A.

**Pin 18 J171 (LEFT)**

The external J17 de-emphasis network for channel 1. The amplifier for this filter is voltage input, current output; with  $\pm$  500mV input the output will be  $\pm$  55 $\mu$ A.

**Pin 19 AUXIN2 (RIGHT)**

Same as Pin 16.

**Pin 20 U752 (RIGHT)**

Same as Pin 17.

**Pin 21 J172 (RIGHT)**

Same as Pin 18.

**Pin 22 GND**

This ground pin is double bonded ; 1) to channel 1 RF section & VCO and 2) to both AGC amplifiers, channel 1 audio section, audio MUX, internal power & references to audio section.

**Pin 23 DET1 (LEFT)**

The output of FM phase detector 1 (left channel). This is for the connection of an external loop filter for the PLL. The output is a push pull current source with  $\pm$  90 $\mu$ A output with  $\pm$  500mV input to the internal mixer.

**Pin 24 FMIN1**

This is the positive input to the two FM demodulators. It feeds two AGC amplifiers with a bandwidth of at least 5-10MHz. There is one amplifier for each channel both with the same differential input. The AGC amplifiers have a 0dB to + 40dB range ; in conjunction with AMPLOCK function it will produce a constant amplitude of the selected subcarrier.  
Z<sub>IN</sub> = 5k $\Omega$  Min input = 2mV<sub>PP</sub> per subcarrier  
Max input = 500mV<sub>PP</sub> (max when all subcarriers are added together, when their phases coincide).

**Pin 25 AGC1 (LEFT)**

AGC amplifier 1 peak detector capacitor connection. The output current has an attack/decay ratio of 1:32. That is the ramp up current is approximately 5 $\mu$ A and decay current is approximately 160 $\mu$ A. 11V gives maximum gain. This pin is also driven by a circuit monitoring the voltage on AMPLOCK1.

**Pin 26 FMN2**

This is the -ve input to the AGC amplifiers forming a differential input stage. All inputs are biased to  $V_{REF}$  (2.35V) via an internal 10k $\Omega$  resistor.

**Pin 27 VREF (2.35V)**

This is the audio processor voltage reference used throughout the FM/audio section of the chip. As such it is essential that it is well decoupled to ground to reduce as far as possible the risk of crosstalk and noise injection. This voltage is derived directly from the bandgap reference. It cannot sink current.

**Pin 28 VCC (+12V power supply)**

Double bonded main power pin for the audio/FM section of the chip. The two bond connections are; (1 to the ESD and guard rings and 2) to power the circuit and on chip regulators/references.

**Pin 29 DET2 (RIGHT)**

Same as Pin 23.

**Pin 30 AMPLOCK1 (LEFT)**

The output of amplitude detector 1. Requires a capacitor and a resistor to GND. The voltage across this is used to decide whether there is a signal being received by FM det 1. The level detector output drives a bit in the 'control block' I<sup>2</sup>C bus register 7 bit 0. This also drives AGC amp 1. When the voltage on this pin is  $>(V_{REF}+1V_{BE})$  it sinks current to  $V_{REF}$  from pin 25 to reduce the AGC gain.

**Pin 31 CPUMP1 (LEFT)**

The output from the frequency synthesizer is a push-pull current source which requires a capacitor to ground to derive a voltage to pull the VCO to the target frequency. The output is  $\pm 100\mu A$  to achieve lock and  $\pm 2\mu A$  during lock to provide a tracking time constant of approximately 10Hz.

**Pin 32 AGC2 (RIGHT)**

Same as Pin 25.

**Pin 33 GND**

This ground pin is double bonded ; 1) to the volume control, ANRS, ESD and guard rings and 2) to the VCO & RF section of channel 2.

**Pin 34 AMPLOCK2 (RIGHT)**

Same as Pin 30

**Pin 35 CPUMP2 (RIGHT)**

Same as Pin 31.

**Pin 36 IREF**

This is a buffered  $V_{REF}$  output to an off-chip resistor to produce an accurate current reference, within the chip, for the biasing of amplifiers with current outputs into filters. It is also required for the ANRS circuit to provide accurate rolloff frequencies. This pin should not be decoupled as it will inject current noise. The target current is  $10\mu A \pm 2$  thus a 240k $\Omega \pm 1\%$  is required.

**5 - AUTOMATIC NOISE REDUCTION SYSTEM (ANRS) AND VOLUME CONTROL**

There is a ANRS defeat which allows the audio to bypass the ANRS section but still go to the volume control. The volume control will be 32 steps of 1.25dB, with the lowest step being audio 'mute' (no output).

**Pin 37 PEAKOUT**

The ANRS control loop peak detector output requires a capacitor to ground from this pin. Also a resistor to  $V_{REF}$  pin 27 to give some accurate decay time constant. The value of the capacitor and resistor control the attack and decay times, typically 0.1ms attack & 25ms decay.

**Pin 38 FCLEFT**

The variable bandwidth gm amplifier has a current output which is variable depending on the input signal amplitude as defined by the control loop. The output current is then dumped into an off-chip capacitor which together with the accurate current reference define the min/max rolloff frequencies. A capacitor is connected to ground from this pin for channel 1 (left).

**Pin 39 PEAKIN**

This is the input to the control loop peak detector and is connected to the output of the off-chip control loop band pass filter. This requires AC coupling between this input pin and the summer output Pin 40.

**Pin 40 SUMOUT**

The two audio demodulated signals are summed together with an amplifier with a gain of 0.5 ie. if both inputs are 1 volt then the output is 1 volt. This amplifier has an input follower buffer which gives a  $V_{BE}$  offset in the DC bias voltage. Thus the filter which this amplifier drives must include AC coupling to the next stage (pin 39).

**Pin 41 FCRIGHT**

Same as Pin 38

**Pin 42 AUDIOOUT2 (RIGHT)**

The main audio output from the volume control level shifted and amplified to produce 2V<sub>PP</sub> on a DC bias of 4.7 volts. This amplifier has short circuit protection and is intended to drive a SCART connector directly via AC coupling and meets the standard SCART drive requirements.

**Pin 43 AUDIOOUT1 (LEFT)**

Same as Pin 42.

**6 - VIDEO BLOCK**

**Pin 5 SYNCIN**

This input can be programmed to accept either a digital or an analog sync stream. The digital input will accept a made up sync signal consisting of the Genlock 'line' and 'frame' sync output. If it is smaller than 0.8V then it produces a sync tip level voltage (1.22V). If it is greater than 2.0V it produces black level (1.52V). This will generate a sync stream signal consisting of syncs only, that will be available on the 'Video Matrix'. The DC level of these syncs at the SCART O/Ps will be sync tip = 1.22V black level = 1.7V. The analog path is connected directly to the video matrix.

When pin-49 is selected for the video MUX, it is still possible to insert an external sync. The input must be a digital sync (Reg 18b6 = 1 > sync enabled) and is typically used to stabilise the OSD on a bad or noisy video on pin-52 only.

**Control bits**

2 bits	I <sup>2</sup> C bus	Reg 1	bits 6,5	Effect
				Sync source
default	-----	X	0	Digital
			0	Analog
			1	Pin-49 clamped

**Pin 45 S2VIDIN**

External video input 1V<sub>PP</sub> AC coupled 75Ω source impedance returned from a VCR for example. This input has a DC restoration clamp on its input. This gets the video to the correct DC level so that OSD can be added later when it is essential that the voltages of the video and OSD are at the correct levels with respect to each other. The clamp sink current is 1μA ± 30% with the buffer Z<sub>i</sub> > 1MΩ. This signal is an input to the Video Matrix and is called SCART-2 Return.

**Pin 46 S1VIDIN**

External video input 1.0V<sub>PP</sub> AC coupled 75Ω source impedance. This input has a DC restoration clamp on its input. This gets the video to the correct DC level so that OSD can be added later when it is

essential that the voltages of the video and OSD are at the correct levels with respect to each other. The clamp sink current is 1μA ± 30% with the buffer Z<sub>IN</sub> > 1MΩ. This signal is an input to the Video Matrix and is called SCART-1 Return.

**Pin 47 DEC1IN**

This input receives a PAL encoded output from, for instance a D2MAC decoder inside the receiver. The signals from pins 47 and 48 go to an internal selector switch that selects which signal goes to the Video Matrix.

**Control bit**

1 bit	I <sup>2</sup> C bus	Reg 1	bit 4	Signal selected
			default	0 Pin 48 (DEC2IN)
				1 Pin 47 (DEC1IN)

The output signal from the selector switch, which goes to the Video Matrix, is called Internal Decoder Return.

**Pin 48 DEC2IN**

This input can be driven for instance by the output of a Videocrypt decoder Z<sub>OUT</sub> = 500Ω video about 1.0V<sub>PP</sub> from the reconstruction filter. This input has a DC restoration clamp on its input. This gets the video to the correct DC level so that OSD can be added later when it is essential that the voltages of the video and OSD are at the correct levels with respect to each other.

The clamp sink current is 1μA ± 30% with the buffer Z<sub>IN</sub> > 1MΩ. The signals from pins 47 and 48 go to an internal selector switch that selects which signal goes to the Video Matrix.

**Control bit**

1 bit	Reg 1	bit 4	Signal selected
		default	0 Pin 48 (DEC2IN)
			1 Pin 47 (DEC1IN)

**Pin 49 VI5**

A video input with clamp @ 1.22V internally. It may be employed for use with noisy video signals by overriding the sync clamp externally at about 3V (this overcomes the 1.22V plus 2x V<sub>BE</sub>).

**Pin 50 OSDIN**

Typically driven by a combination of an OSD O/P and the 'Blank' output from the OSD bit of the Micro. This input is then threshold detected and two outputs are generated.

Input	Output	
	Background	Text
< 0.8V	0	0
1.5-2.5V	1	0
> 3.5V	1	1

## STV0030

### Pin 51 S3VIDOUT

Video driver for SCART-3 with OSD. This requires an external emitter follower buffer to drive a 150Ω load. The average DC voltage to be 1.5V on the O/P. The signal on pin 51 is video 2.0V<sub>PP</sub> 5.5MHz B/W with sync tip=1.22V. This SCART O/P will be used to drive the TV typically. This pin gets its signal from the Video Matrix. It is then amplified and OSD is added before being output. The signal selected from the Video Matrix for output on this pin is controlled by a control register.

#### Control bits

3 bits I <sup>2</sup> C bus Reg	4 bits	2,	1,	0	Source selected
		0	0	0	Baseband
		0	0	1	De-emphasised
default	-----	0	1	0	Normal video
		0	1	1	Decoder return
		1	0	0	SCART 1 return
		1	0	1	SCART 2 return
		1	1	0	Syncs
		1	1	1	Nothing selected

OSD addition is controlled by a control register. It is possible to separately control whether or not to add 'blanking' and/or 'text' to the video stream to this SCART output.

		1	0	0	SCART 1 return
		1	0	1	SCART 2 return
		1	1	0	Syncs
		1	1	1	Nothing selected

**Pin 55 DECOUT1**

This output can drive for instance a decoder. To allow for D2MAC it is able to pass 10MHz ; ZOUT < 75Ω. Video on this pin will be 1.9V<sub>PP</sub>. When a Videocrypt encoded signal is output to the decoder on this pin its sync tips must be at 1.46V<sub>DC</sub>. This pin gets its signal from the Video Matrix. It is then level shifted and amplified by 1.9 before being output. The signal selected from the Video Matrix for output on this pin is controlled by a control register.

## Control bits

3 bits I <sup>2</sup> C bus	Reg 5 bits	2,	1,	0	Source selected

		1	0	0	SCART 1 return
		1	0	1	SCART 2 return
		1	1	0	Syncs
		1	1	1	Nothing selected

**Pin 56 V<sub>CC</sub>**

+12V double bonded ; 1) ESD+guard rings & 2) video circuit power.

**Pin 57 GND**

Strategically placed video power ground connection to reduce video currents getting into rest of circuitry.

**Pin 58 CLAMPIN**

This pin clamps the most negative extreme of the input (the sync tips) to +1.22V<sub>DC</sub> (or appropriate voltage). The video at the clamp input is only 1V<sub>PP</sub>. This clamped video which is de-emphasised, filtered and clamped (energy dispersal removed) is normal, negative syncs, video. This signal drives the Video Matrix input called Normal Video.

It has a weak (1.0µA ± 15%) stable current source pulling the input towards GND. Otherwise the input impedance is very high at DC to 1kHz Z<sub>IN</sub> > 2MΩ. Video bandwidth through this is -1dB at 5.5MHz. The CLAMP input DC restore voltage is then used as a means for getting the correct DC voltage on

the SCART outputs.

**Pin 59 DEEMPHOUT**

Output of de-emphasis Z<sub>OUT</sub> < 50Ω 2V<sub>PP</sub> B/W still 10.25MHz. This is the output that drives the capacitor into the CLAMP. It has to do this via the sound removal filter which may be a 5 or 7 pole low pass filter Z<sub>IN</sub> = Z<sub>OUT</sub> = 500Ω -3dB corner about 5.25MHz. Video at pin 59 is positive. Internally the 2V<sub>PP</sub> video is reduced to 1V<sub>PP</sub> to drive the internal Video Matrix input called De-emphasised video. This signal also called 'Unclamped Unfiltered' and is the signal required by Filmnet PAL decoders for example. It is called unfiltered because it still has its high frequency sub-carriers (not been through the low pass filter).

**Pin 60 DEEMPHIN**

Input of de-emphasis stage, with a Z<sub>IN</sub> of 10kΩ or greater. B/W is 10.25MHz. The network between pins 59 & 60 will give 2x gain at 1.52MHz, about -2dB gain at 5MHz and +17dB gain at 10kHz as in accordance with CCIR 405-1.

**Pin 61 VIDIN**

AC-coupled Video input from a tuner. This is raw baseband up to 10.25MHz. Input amplitude is 0.25-1.0V<sub>PP</sub> at 1.52MHz. Z<sub>IN</sub> > 5kΩ. This drives an on-chip video amplifier. The other input pin of this amp is AC grounded by being connected to an internal V<sub>REF</sub>. The video amplifier has selectable gain from 0dB to 12.7dB in 63 steps. This is programmable, as is the output selected, whether normal or inverted.

Control bits

6 bits I <sup>2</sup> C bus Reg 18	bits	5,	4,	3,	2,	1,	0	Gain Selected
default	-----	0	0	0	0	0	0	0dB
		n						n x 0.202dB
		1	1	1	1	1	1	+12.7dB

The normal or inverted output selected (which is 1.0V<sub>PP</sub>) also drives the Video Matrix input called Baseband.

Control bit

1 bit I <sup>2</sup> C bus Reg 1	bit	3	Video selected
default	----	0	Normal
		1	Inverted

**Pin 62 GND**

Ground, especially for the low level input from the tuner.

0030-08 TEL

**CIRCUIT DESCRIPTION : VIDEO SECTION**

The composite video is first set to a standard level by means of a 64 step gain controlled amplifier. In the case that the modulation is negative, an inverter can be switched in. The deemphasis network is fed by a wide bandwidth amplifier and energy dispersal is removed by a sophisticated sync tip clamping circuit. This circuit is used on all inputs to a video switching matrix, thus making sure that no DC steps occur when switching video sources.

The matrix can be used to feed video to and from decoders such as D2MAC or scrambled analog video.

Two special inputs allow insertion of graphics on video or clean sync, or a mix of both even when only noise is present at the tuner output.

**CIRCUIT DESCRIPTION : AUDIO SECTION**

The two audio channels are totally independent except for the possibility given to output on both channels only one of the selected input audio channels.

To allow a very cost effective application, each channel uses PLL demodulation. Except for the overall high pass filter removing the video of the composite signal, no complex filter is needed.

The frequency of the demodulated subcarrier is chosen by a frequency synthesiser which sets the frequency of the internal local oscillator by comparing its phase with the internally generated reference. When the frequency is reached, the microprocessor switches in the STV0030 PLL and the demodulation starts. At any moment the microprocessor can read from the device the actual

frequency to which the PLL is locked. It can also verify that a carrier is present at the given frequency, thanks to an amplitude demodulator which is also used for the audio input AGC.

In order to maintain constant amplitude of the recovered audio regardless of variations between satellites or subcarriers, the PLL loop gain may be programmed from 28 values, with coarse (four values) and fine (7 steps) adjustment.

Two different networks can be permanently connected for either 75 $\mu$ s or J17 de-emphasis. If 50 $\mu$ s de-emphasis is required, this can be inserted by an internal switch, thus allowing a worldwide application.

A dynamic noise reduction system (ANRS) is used using a lowpass filter, the cutoff frequency of which is controlled by the amplitude of the audio after insertion of a bandpass filter.

Two audio outputs are provided : one is a fixed 1V<sub>PP</sub> and the other is a gain controlled 2V<sub>PP</sub>. These outputs are chosen by an audio matrix between non de-emphasised, 50 or 75 $\mu$ s de-emphasised, J17 deemphasised audio channel. In each case the dynamic noise reduction system can be used. Alternatively the selected outputs can receive the auxiliary audio inputs without processing. The gain controlled amplifier has a gain range from + 6dB to - 32dB with 1.25dB steps. This can also be muted.

The 8-bit Digital to Analog Converter outputs a voltage ranging from 0 and 2.35V via a differential amplifier for digital words from 00 to FF. By adding a suitable output buffer/converter, this DAC can be used to control LNB voltages (or polariser currents) with a range exceeding 0 to 2.35V.

**IIC PROTOCOL**

The chip address is 06<sub>H</sub> if Pin 8 to ground and 46<sub>H</sub> if Pin 8 to V<sub>DD</sub>.

**Transmit to Chip**

S = START A = ACK P = STOP

**Receive from Chip**

In read mode a pointer is written to register 0. This pointer addresses a particular register whose contents can be read any number of Times. There are 19 registers in Total.

## IIC CONTROL REGISTERS

## Reg 1 IIC → reg

bit

- 0 L Not used
- 1 L Not used
- 2 L Not used
