## Total Ionizing Dose Test Report

May 2000

Addendum to RIC7113 Total Ionizing Dose Test Report dated May 2000

December 28, 2001

Wafer traceability is not clear. The following table indicates the connection between the serial numbers and the wafers tested.

<b>Wafer Number</b>	<b>Serial Numbers</b>
2	1 thru 8
6	9 thru 18
8	19 thru 27
10	28 thru 37
14	38 thru 47
17	48 thru 56
20	57 thru 63
23	64 thru 73

The last table identifies where each serial number was used:

<b>Wafer Number</b>	<b>Dynamic Test</b>	<b>Static Test</b>	<b>500krad</b>	<b>Serial Numbers Not Used</b>
2	8	3, 4, 5, 6	2	1, 7
6	15	12, 16, 17, 18	11	9, 10, 13, 14
8	20, 25	21, 22, 26, 27	None	19, 23, 24
10	30, 33	34, 35, 36, 37	31	28, 29, 32
14	40, 41	44, 45, 46, 47	39, 43	38, 42
17	53	50, 51, 52, 54	48, 56	49, 55
20	63	58, 59, 60, 61	None	57, 62
23	65, 66	68, 69, 70, 73	71	64, 67, 72

The data above may be used to navigate thru the test report, which did not make consistent use of the serial numbers. The serial numbers are shown at the top row of each column in the test data (Appendix B and C). In some cases the serial number is shown alone and in other cases the wafer number is indicated as a dash number.

**Radiation Testing**

The RIC7113 has been tested in accordance with MIL-STD-883 test method 1019, condition A. Raytheon Corp. in El Segundo, CA has been contracted to perform the irradiation and supply the device bias during irradiation. The Defense Supply Center Columbus (DSCC) has granted Raytheon test lab suitability for this test method performed at the El Segundo site. All other tests including burn-in, electrical performance and aging are performed at International Rectifier Corp. in El Segundo, CA. The test plan for conducting the radiation testing is included in Appendix A, herein.

Radiation testing is comprised of two electrical bias conditions – static and dynamic. Static bias is performed on a sample of assembled devices from all wafers considered for production. Dynamic bias is performed on a small sample of assembled devices as a one-time qualification test. Schematics of static and dynamic bias circuits are shown in Figures 1 and 2, respectively.

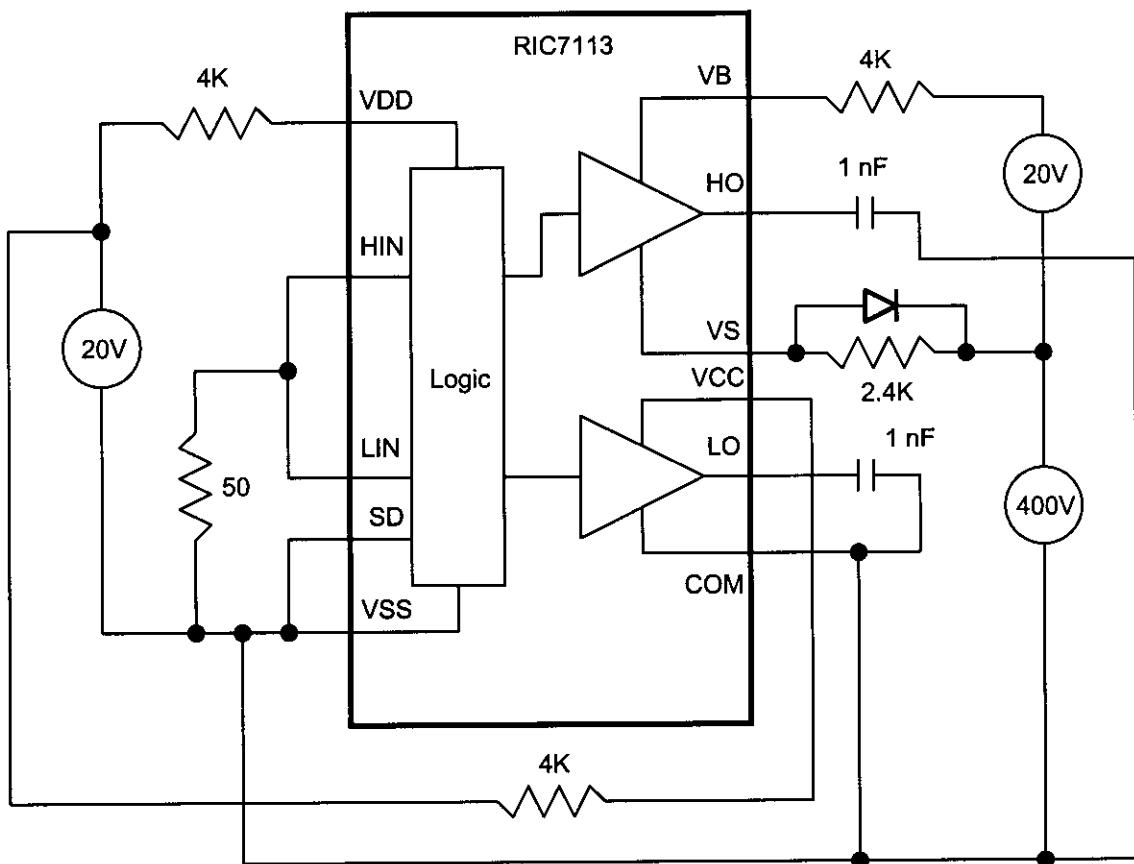

Figure 1 – Static Bias Circuit

**INTERNATIONAL RECTIFIER  
EL SEGUNDO, CALIFORNIA**

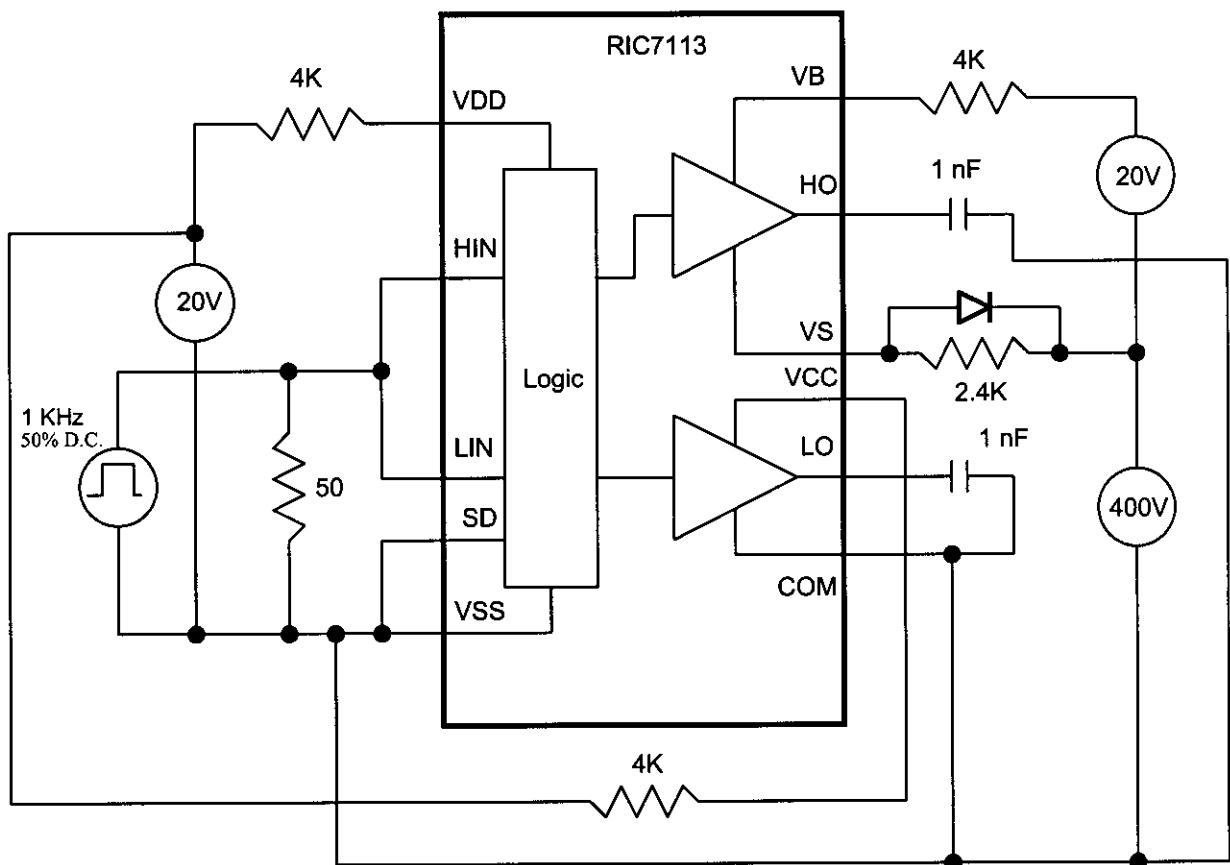

Figure 2 – Dynamic Bias Circuit

Test Results

The electrical test results are provided in Appendix B, herein. All devices tested were within specification limits immediately following the irradiation. Following the accelerated aging, again all devices tested were within specification limits. The mean values of key parameters are shown in Table 1 below for each test point. Much of this data is shown graphically in figures 3 thru 14 below. One device S/N 8, failed the initial electrical test but was not noticed until further testing was completed. Subsequent electrical testing of S/N 8 did not indicate any problem, thus it was concluded that the initial data was incorrect.

Eight additional devices were irradiated to a 500Krad (Si) level. Four of the devices (S/N's 2, 11, 31, 39)were dynamically biased and four (S/N's 43, 48, 56, 71) were statically biased. All eight devices failed. The four dynamically biased devices failed functionally. The four statically biased devices failed parametric limits only. The electrical data following the irradiation is shown in Appendix C.

**Conclusion**

Wafer lot 800819 has demonstrated radiation hardness against ionizing radiation. The parametric stability of the device is excellent as measured in accordance with MIL-STD-883 test method 1019, condition A.

The post-irradiation limits may be set equal to the pre-irradiation limits, as very little variation was noted.

The device is not suitable for an irradiation environment in excess of 333Krad(Si) as determined by evaluation of 8 samples tested to 500Krad(Si) (1.5X). Further evaluation is needed to more fully characterize the performance versus irradiation.
