

# R96FE 9600 bps Facsimile Engine **Device Set**

# INTRODUCTION

The R96FE FAXENGINE™ provides a complete set of facsimile machine control functions integrated into a 2-package VLSI device set. This integration reduces the manufacturer's hardware and development costs by eliminating external components. The device set consists of an Integrated Facsimile Controller (IFC) and a 9600 bps MONOFAX® modem.

The IFC performs the primary facsimile machine control and monitoring functions interfacing with the major fax machine components. Scanner, printer, and keyboard interfaces are included as are motor control drivers and the modem interface. These functions and interfaces are programmable to support a wide range of hardware peripherals. CCITT T.4 data compression/decompression functions (MH and MR) are implemented by the IFC. Fax machine video processing functions are provided utilizing an on-board flash A/D converter for up to 64 levels of gray scale. The IFC is supplied in an industry-standard 160-pin plastic quad flat package (PQFP).

The MONOFAX modem is a synchronous 9600 bps halfduplex modem (R96DFX or R96VFX) which offers connectivity and compatibility with fax machines world-wide.

An R96FE Development System can be purchased to reduce the manufacturer's design costs and time-to-market. The R96FE Development System includes:

- 1. The FAXENGINE Evaluation System (FEES): a standalone development board that acts as the fax machine motherboard. The FEES includes an IFC socket; ROM and RAM; LCD and keyboard/LED modules; speaker; phone jack; printer and scanner interfaces; and data access arrangement (DAA) circuitry. Video processing, modem, and DAA daughterboards are also included.
- 2. A FAXENGINE ROM Emulator (FERE): a personal computer-based code development aid with breakpoint and trace capability for debugging customer-created firmware that will operate in the R96FE external ROM.
- 3. A royalty free license to use the development software consisting of Rockwell's core macros (high-level routines common to fax machines) and core primitives (low-level routines for accessing FAXENGINE hardware) supplied in object code. An example application program for a typical complete fax machine is supplied in assembly source code. This example code, although not intended for production, can be used as a basis for developing a customer's specific fax machine application.

# **FEATURES**

- Integrates facsimile control circuitry
  - -Reduces device count: saves board space
  - -Simplifies design; reduces production cost
  - -Reduces development time and cost
  - -Reduces power dissipation
- Facsimile processing firmware provided
  - -Reduces development time and cost
  - -Macros and primitives in object code
- -Example application in assembly source code
- T.4 MH/MR compression/decompression in hardware
- · Programmable thermal printer interface
  - -Up to 9 strobes
  - -On-chip thermal head temperature A/D converter
- Programmable scanner interface
  - -No external sample and hold required
  - -Scan widths to 2048 pixels (B4)
  - -5 ms minimum scan time
- Programmable control for two stepper motors
- Programmable operator panel interface
  - -32 keys, 8 LEDs, one LCD module
- · Programmable tone output for operator alert
- Video processina
  - -6-bit flash A/D converter with voltage reference inputs supports external background correction
  - -Scanner shading correction (8 bits/pixel)
    - 1 correction per 8 pixels with internal RAM
    - 1 correction per pixel with external RAM
  - -Configurable dither table (up to an 8 x 8 pattern)
- Internal MC19 CPU
  - -7 MHz clock speed
  - -Programmable wait states for external devices
- 26 to 34 general purpose input/output (GPIO) pins

FAXENGINE is a trademark of Rockwell International. MONOFAX is a registered trademark of Rockwell International.

#### HARDWARE DESCRIPTION

The R96FE FAXENGINE general hardware interface is illustrated in Figure 1.

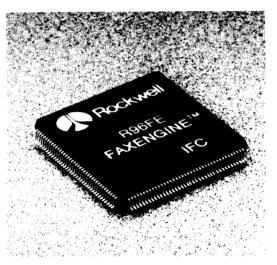

### Integrated Facsimile Controller (IFC)

The IFC contains an internal 8-bit microprocessor and dedicated circuitry optimized for facsimile signal processing and facsimile machine control and monitoring.

**Microprocessor.** The microprocessor is an enhanced MC19 central processing unit (CPU). This CPU provides fast instruction execution and memory efficient input/output bit manipulation. The CPU connects to other internal IFC functions over a 16-bit address/8-bit data bus and dedicated control lines. The bus is routed outside the IFC for external memory access.

Scanner, Printer Motor Control. Eight outputs are provided to external current drivers; four for the scanner motor and four for the printer motor. Firmware primitives support up to a 256-step control pattern for each motor.

**Expansion Bus Control.** Address, data, control, status, and decoded chip select signals support connection to external ROM, optional RAM, and optional peripheral devices

R96FE FAXENGINE Integrated Facsimile Controller (IFC)

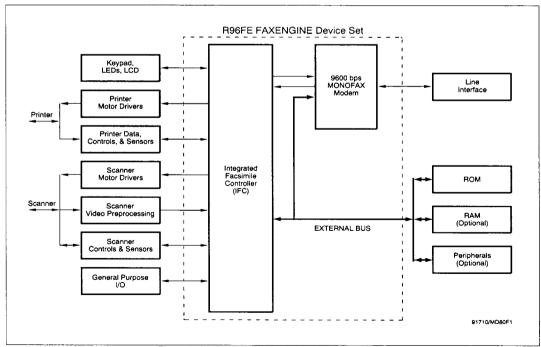

Figure 1. R96FAXENGINE Device Set General Interface

# R96FE

# 9600 bps Facsimile Engine Device Set

Operator Interface. Four enable inputs, eight strobe outputs, and two control outputs support the operator interface. A 32-key keypad can be supported directly. An 8 x 15 keyboard (120 keys) can be supported with external circuitry.

The strobe outputs can also be used as LED drivers or as LCD data lines. Up to eight LEDs can be directly driven.

A wide variety of LCD displays can be driven using a 4-bit data bus and two separate control lines.

Video Control. Seven programmable control and timing signals support common CCD and CIS scanners. The video control function provides signals for controlling the scanner and for processing its video output.

Scanner Flash A/D Converter. A 6-bit flash A/D converter interfaces to the scanner. The A/D reference inputs are made available for control by external background correction circuits.

T.4 Compressor/Decompressor. IFC hardware provides MH and MR data compression and decompression per CCITT Recommendation T.4.

Video Processing. The IFC provides shading RAM and support firmware for two modes of correction for scanner non-linearities arising from uneven sensor output or uneven illumination. In one mode, correction is provided on an 8-pixel group at a time basis; 256 bytes of IFC internal RAM store one byte of correction for each eight consecutive pixel positions. In the other mode, correction is applied separately to each pixel; 2K bytes of internal RAM are used. When using the one correction byte per pixel mode, external RAM is required to store CPU variables.

The IFC includes a dither table ranging in size up to 8 x 8; rows and columns are independent. The dither table is stored in internal RAM (8 bits per element).

**External ROM.** External ROM stores all the FAXENGINE program object code.

#### **MONOFAX Modem**

The modem is a synchronous 9600 bps half-duplex R96DFX or R96VFX MONOFAX modem. These modems support Group 3 fax, HDLC framing, tone generation, and DTMF reception in the R96FE application. The R96VFX also provides a voice coder/decoder. The modem can operate over the public switched telephone network (PSTN) or the general switched telephone network (GSTN) through line terminations provided by a data access arrangement (DAA). The modem satisfies the requirements specified by CCITT recommendations V.29, V.27 ter, V.21 Channel 2, and T.4, and meets the binary signaling requirements of T.30. The modem can operate at 9600, 7200, 4800, 2400, or 300 bps, and also includes the V.27 short training sequence option.

# HARDWARE INTERFACE DESCRIPTION

### Scanner interface

Video A/D Converter
Accuracy: ± 0.5 LSB
Input range: 0 to VDD

Vref differential input range: 0.8 V to 3.0 V Operating range: -VREF to +VREF No sample and hold circuit required

# Scanner Control

Four output signals: START, CLK1, /CLK1, CLK2

Scan line period: 4 to 40 ms

Dot sample point: Programmable to 1/16 dot period

Control signal rising and falling edges:

Independently programmable to 1/16 dot period

## Video Circuitry Control

Three output signals: VIDCTL0, VIDCTL1, VIDCTL2

VIDCTL0 rising and falling edges:

Independently programmable within each dot period

VIDCTL1 and VIDCTL2 rising and falling edges: Independently programmable within a scan line period

# Scan Data Transfer Control (VIDCTL2)

Scan start delay: 0 to 2047 dots Line length: 8 to 2048 dots, modulo 8

#### Video Processing

Dither table: Programmable to an 8 x 8 pattern

Independent rows and columns

Shading correction: Up to 50% ADC range

# Printer Interface

# Print Data Transfer Control

Three output signals: PDAT, PCLK, PLAT

Polarity control: Programmable on all three outputs

Line period: 4 to 40 ms

Data offset: 0 to 2040 dots, modulo 8

Number of dots: 8 to 2048 dots, modulo 8

## Strobe Generation

Strobe count: 1 to 9 strobes Polarity control: Strappable

Prescaler clock: 1 to 8 printer data clocks (PCLK)

Strobe period: 1 to 256 prescaler clocks
Strobe width: 1 to 256 prescaler clocks

Strobe width adjustable at the start of each line

Non-overlapping strobes

3

# R96FE

9600 bps Facsimile Engine Device Set

Temperature A/D Conversion

Resolution: 8 bits Accuracy: 6 bits

Conversion time: Less than 2 ms

## Power-On Reset (/PORES) Input

/PORES input initializes R96FE upon power turn on.

Requires only a simple RC input network.

### Reset (/RESET) Input/Output

Open drain input/output: Can accept external reset input or provide reset output to external circuit.

### Watchdog Timer

IFC watchdog timer serviced by the IFC.

Programmable watchdog enable.

Programmable time-out period before reset.

#### **Tone Generator**

Single tone output

Programmable frequency: 20 to 4000 Hz

# General Purpose I/O (GPIO)

26 GPIO signals (GPIO0 – GPIO10, HIO0 – HIO13, HIO15)

Unused printer strobes (PIO0 - PIO7)

Programmable direction control for all GPIO functions

# **System Timing**

Timing source: External oscillator or modem clock Two internal timer interrupts: 2 ms and 1/8 line time

#### **External RAM Interface**

Wait states for RAM chip select: 0 to 3 RAM access time: 70 ns with 0 wait states

# **External ROM Interface**

Wait states for ROM chip select: 0 to 3 ROM access time: 70 ns with 0 wait states

# POWER AND ENVIRONMENTAL REQUIREMENTS

R96FE power requirements are shown in Table 1.

R96FE environmental specifications are listed in Table 2.

### HARDWARE INTERFACE SIGNALS

The R96FE functional hardware interface signals are shown in Figure 2.

### **IFC INTERFACE SIGNALS**

The IFC hardware signal pin assignments are shown in Figure 3. The definitions of the pin signals are summarized in Table 3. The hardware signal characteristics are described in Table 4.

### MONOFAX MODEM INTERFACE SIGNALS

The modem pin assignments are shown in Figure 4. The pin assignments are listed by pin number in Table 5.

The modem hardware interconnect signals are listed by functional group in Table 6.

Table 1. Power Requirements

Device	Voltage	Typ. Current @ 25°C	Max. Current @ 0°C
IFC	+5 VDC ±5%		
VDD & ADVD		75 mA	
ADVA		12 mA	
TADV		1 mA	
R96DFX	+5 VDC ±5%	60 mA	64 mA
	-5 VDC ±5%	14 mA	16 mA

Table 6. Modem Hardware Interface Signals

Name	Type	Description	Comments
Overhead Signals			
XTLI	R	Crystal/Clock Input	Connect to 24.00014 MHz Crystal (26.39998 MHz for R96VFX)
XTLO	R	Crystal Output	Connect to Crystal
PORO	OE	Power-On-Reset Output	Not used - NC (leave open)
PORI	ID	Power-On-Reset Input	Connect to IFC /MRES
+5VD	PWR	Digital +5V Supply	Connect to +5V
+5VA	PWR	Analog +5V Supply	Connect to +5V through 3 Ω
–5VA	PWR	Analog -5V Supply	Connect to -5V
DGND1, DGND2	DGND	Digital Ground	Connect to Ground
AGND1, AGND2	AGND	Analog Ground	Connect to Ground
System Bus Interfa			
D0-D7	IA/OB	Data Bus Line 0-7	Connect to System Bus D0-D7
RS0-RS4	IA	Register Select 0-4	Connect to System Bus A0-A4
CS	IA	Chip Select	Connect to IFC /MCS
READ	IA	Read Enable	Connect to System Bus /RD
WRITE	IA	Write Enable	Connect to System Bus /WR
IRQ	oc	Interrupt Request	Connect to IFC /MIRQ
Auxillary Signals			
EN85	R	Enable 85 Bus	Connect to GND though 10K Ω
CABLE1	IB	Cable Select 1	Connect to +5V or GND
CABLE2	IB	Cable Select 2	Connect to +5V or GND
XCLK	OD	X Clock Output (XTLI/2)	Connect to IFC SYSCLK
YCLK	OD	Y Clock Output (XTLI/4)	Not used - NC (leave open)
Analog Signals	AA	T	Occupation Piles Inc.
TXOUT RXIN	AB	Transmit Analog Output Receive Analog Input	Connect to Smoothing Filter Input
Modem Interconne		Receive Analog Input	Connect to Anti-aliasing Filter Output
***********		Madan Intercept	O
EN85I	R R	Modern Interconnect	Connect to EN85
DCLKI	R	Modern Interconnect	Connect to DCLK
DCLK	R	Modem Interconnect Modem Interconnect	Connect to DCLKI
ECLKIN1 ECLKIN2	R	Modern Interconnect	Connect to EYECLK Connect to EYECLK
SYNCIN1	R	Modern Interconnect	Connect to EYESYNC
SYNCIN2	R	Modern Interconnect	Connect to EYESYNC
RCVI	R	Modern Interconnect	Connect to RCVO
RCVO	R	Modern Interconnect	Connect to RCVI
ADIN	R	Modern Interconnect	Connect to ADOUT
ADOUT	R	Modern Interconnect	Connect to ADIN
DAIN	R	Modern Interconnect	Connect to DAOUT
DAOUT	R	Modern Interconnect	Connect to DAIN
FIN	Ř	Modern Interconnect	Connect to FOUT
FOUT	R	Modern Interconnect	Connect to FIN
AEE	R	Modern Interconnect	Connect to AGND
AES	R	Modem Interconnect	Connect to AGND
AGCIN	R	Modem Interconnect	Connect as shown in Figure 7
AOUT	R	Modem Interconnect	Connect as shown in Figure 7
RCI	R	Modem Interconnect	Connect as shown in Figure 7
TXD	IA	Transmit Data	Connect to pullup
RTS	IA	Request to Send	Connect to +5V through 10K Ω
RXD	OA	Received Data	Not used - NC (leave open)
CTS	OA	Clear to Send	Not used - NC (leave open)
RLSD	QA	Received Line Signal Detected	Not used - NC (leave open)
AUXI	AC	Auxiliary Analog Input	Not used - Connect to GND
EYEX	OA	Serial Eye Pattern X Output	Not used - NC (leave open)
EYEY	OA	Serial Eye Pattern Y Output	Not used - NC (leave open)
EYECLK	OA	Serial Eye Pattern Clock	Connect to ECLKIN1 and ECLKIN2
EYESYNC	OA	Serial Eye Pattern Strobe	Connect to SYNCIN1 and SYNCIN2

# R96FE

# 9600 bps FAXENGINE Device Set

#### FIRMWARE DESCRIPTION

#### CORE PRIMITIVES AND MACROS

The R96FE firmware includes proprietary core primitives and macros which occupy approximately 8 kbytes of ROM at the top of the FAXENGINE processor address space. These core primitives and macros provide the following functions:

- Low level subroutines (primitives) for accessing the FAXENGINE hardware.
- 2. High level subroutines (macros) which are common to fax machine implementations.
- Real-time multitasking executive for scheduling high priority (interrupt-driven) tasks and servicing low priority (background) tasks.

The firmware organization is illustrated in Figure 5. The core subroutines are organized with a modular layered structure which allows for the replacement of any of the core subroutines by OEM-written custom subroutines.

### Low Level Subroutines (Primitives)

The core primitives support the following:

- 1. Modem control
- 2. T.30 protocol
- 3. T.4 compressor/decompressor control
- 4. Scanner control
- 5. Printer control
- 6. Operator panel control
  - a. Keypad
  - b. LED
  - c. LCD
  - d. Beeper
- 7. General purpose I/O
  - a. Document/paper sense/control
  - b. DAA control
- 8. Miscellaneous functions
  - a. Memory fill, copy, checksum, etc.
  - b. Text-to-bitmap conversion

These routines are implemented as callable subroutines, interrupt-driven state machines, background task state machines, or a combination thereof. Detailed descriptions of these functions may be found in the R96FE FAX-ENGINE Evaluation System Developer's Guide.

# **High Level Subroutines (Macros)**

The core macros are high level functions common to the operation of standard fax machines (i.e., CCITT compatible operations for transmit and receive). These macro functions simplify the implementation of common operations. Provisions for customization are provided in the R96FE FAXENGINE Evaluation System Developer's Guide. The following functions are implemented:

- 1. Scan document handling (e.g., pull-in and eject)
- 2. Printer paper handling (e.g., eject and cut)
- 3. Copy page
- 4. Send page
- Receive page

#### **FAXENGINE MEMORY MAP**

Figure 6 shows two configurations of the FAXENGINE memory map.

One configuration supports shading correction on an 8pixel group basis. In this configuration, 256 bytes of internal RAM are used for correction.

The other configuration supports shading correction on an individual pixel basis. In this configuration, 2048 bytes of internal RAM are used for correction. Also, a minimum of 2048 bytes of external RAM are required to support other internal IFC functions.

### **FAXENGINE INTERFACE CIRCUIT**

Figure 7 shows the recommended interface circuits to connect the R96FE device set to the OEM electronics.

#### **PACKAGING**

Figure 8 defines the outline and dimensions of the IFC 160-pin PQFP.
