## YM3608 DEQ

### ■ OUTLINE

The YM3608 is a special digital processor developed by Yamaha Corp. for use with digital filters. This processor makes it possible to easily configure IIR and FIR filters for serial sound signals using the internal microprogram.

This processor also makes possible high accuracy calculations and the freedom to rewrite microprogram functions and coefficients using SCI\*.

\* SCI: Serial Control Interface (refer to II-2-1)

### ■ FEATURES

1. All microprogrammable function for digital filter.
2. Multiplication is performed with one clock for Data 16 bits × Coefficient 32 bits.  
(2 clocks for Data 32 bits × Coefficient 32 bits)  
(This is 5-clock pipeline processing.)
3. There are 2 serial input terminals and 2 serial output terminals, both of which can be used with any desired timing.  
The MSB/LSB first and shift clocks can be selected independently for input and output. Input and output are also possible using an external clock.
4. A 50-bit accumulator with 4 bits of head margin and overflow detect is provided.
5. The master clock operates at a maximum phase of 4.4MHz and a minimum phase of 2MHz.
6. Microprogram and coefficients can be controlled with SCI (Serial Control Interface).
7. Up to 128 steps can be used with microprogram.
8. Higher calculation performance is possible by making a serial connection to YM3608 (DEQ).
9. Operates on a single 5V power supply.
10. 24-pin DIP.
