

CMOS Latched 8-/16-Channel Analog Multiplexers

ADG526A/ADG527A

FEATURES

- 44 V supply maximum rating
- V_{SS} to V_{DD} analog signal range
- Single- or dual-supply specifications
- Wide supply ranges (10.8 V to 16.5 V)
- Microprocessor compatible (100 ns $\overline{WR}$ pulse)
- Extended plastic temperature range (-40°C to $+85^{\circ}\text{C}$)
- Low leakage (20 pA typical)
- Low power dissipation (28 mW maximum)
- Available in PDIP, CERDIP, SOIC, and PLCC packages
- Superior alternative to DG526 and DG527

APPLICATIONS

- Data acquisition systems
- Communication systems
- Automatic test equipment
- Microprocessor controlled systems

GENERAL DESCRIPTION

The ADG526A and ADG527A are CMOS monolithic analog multiplexers with 16 single channels and dual 8 channels, respectively. On-chip latches facilitate microprocessor interfacing.

The ADG526A switches one of 16 inputs to a common output, depending on the state of four binary addresses and an enable input. The ADG527A switches one of eight differential inputs to a common differential output, depending on the state of three binary addresses and an enable input. Both devices have TTL and 5 V CMOS logic-compatible digital inputs.

The ADG526A and ADG527A are designed on an enhanced LC^2MOS process that gives an increased signal capability of V_{SS} to V_{DD} and enables operation over a wide range of supply voltages. The devices can comfortably operate anywhere in the 10.8 V to 16.5 V single- or dual-supply range. These multiplexers also feature high switching speeds and low R_{ON} .

PRODUCT HIGHLIGHTS

1. Single- or Dual-Supply Specifications with a Wide Tolerance. The devices are specified in the 10.8 V to 16.5 V range for both single and dual supplies.
2. Easily Interfaced. The ADG526A and ADG527A can be easily interfaced with microprocessors. The $\overline{WR}$ signal latches the state of the address control lines and the enable line. The $\overline{RS}$ signal clears both the address and enable data in the latches, resulting in no output (all switches off). $\overline{RS}$ can be tied to the microprocessor reset pin.
3. Extended Signal Range. The enhanced LC^2MOS processing results in a high breakdown and an increased analog signal range from V_{SS} to V_{DD} .
4. Break-Before-Make Switching. Switches are guaranteed break-before-make so that input signals are protected against momentary shorting.
5. Low Leakage. Leakage currents in the range of 20 pA make these multiplexers suitable for high precision circuits.

¹ Overvoltage at A, EN, $\overline{WR}$, $\overline{RS}$, Sx, or Dx pins are clamped by diodes. Limit current to the maximum rating in Table 3.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TERMINOLOGY

R_{ON}

Ohmic resistance between Terminal D and Terminal S.

R_{ON} Match

Difference between the R_{ON} of any two channels.

R_{ON} Drift

Change in R_{ON} vs. temperature.

I_S (Off)

Source terminal leakage current when the switch is off.

I_D (Off)

Drain terminal leakage current when the switch is off.

I_D (On)

Leakage current that flows from the closed switch into the body.

V_S (V_D)

Analog voltage on Terminal S or Terminal D.

C_S (Off)

Channel input capacitance for off condition.

C_D (Off)

Channel output capacitance for off condition.

C_{IN}

Digital input capacitance.

t_{ON} (EN)

Delay time between the 50% and 90% points of the digital input and switch on condition.

t_{OFF} (EN)

Delay time between the 50% and 10% points of the digital input and switch off condition.

t_{TRANSITION}

Delay time between the 50% and 90% points of the digital inputs and switch on condition when switching from one address state to another.

t_{OPEN}

Off time measured between 50% points of both switches when switching from one address state to another.

V_{INL}

Maximum input voltage for Logic 0.

V_{INH}

Minimum input voltage for Logic 1.

I_{INL} (I_{INH})

Input current of the digital input.

V_{DD}

Most positive voltage supply.

V_{SS}

Most negative voltage supply.

I_{DD}

Positive supply current.

I_{SS}

Negative supply current.

TIMING

Figure 13 shows the timing sequence for latching the switch address and enable inputs. The latches are level sensitive; therefore, while $\overline{WR}$ is held low, the latches are transparent and the switches respond to the address and enable inputs. This input data is latched on the rising edge of $\overline{WR}$.

Figure 13. Timing Sequence

Figure 14 shows the reset pulse width, t_{RS} , and reset turn-off time, $t_{OFF}(\overline{RS})$.

Note that all digital input signal rise and fall times are measured from 10% to 90% of 3 V, $t_R = t_F = 20$ ns.
