## 4.8 kHz Ultra-Low Noise 24-Bit Sigma-Delta ADC with PGA

AD7190

### **Preliminary Technical Data**

### **FEATURES**

RMS Noise: 7 nV @ 4.7 Hz (gain = 128) 16.5 noise free bits @ 2.4 kHz (gain = 128) Up to 23 noise free bits (gain = 1) Offset drift: 5 nV/°C Gain drift: 2 ppm/°C Specified drift over time Programmable gain (1 – 128) Update rate: 4.7 Hz to 4.8 kHz Internal or external clock Simultaneous 50 Hz/60 Hz rejection Four general purpose digital outputs Power supply: 3 V to 5.25 V Current: 6 mA Temperature range: -40°C to +105°C

### INTERFACE

3-wire serial SPI®, QSPI™, MICROWIRE™, and DSP compatible Schmitt trigger on SCLK

#### APPLICATIONS

Weigh scales Strain gauge transducers Pressure measurement Temperature measurement Chromatography PLC/DCS Analog Input Modules Data Acquisition Medical and Scientific instrumentation

### **GENERAL DESCRIPTION**

The AD7190 is a low noise, complete analog front end for high precision measurement applications. It contains a low noise, 24bit  $\Sigma$ - $\Delta$  ADC. The on-chip low noise gain stage means that signals of small amplitude can be interfaced directly to the ADC.

The device can be configured to have two differential inputs or four pseudo-differential inputs. The device can be operated with either the internal clock or an external clock. The output data rate from the part can be varied from 4.7 Hz to 4.8 kHz.

The device can be operated with a sinc<sup>3</sup> or a sinc<sup>4</sup> digital filter. At the lower update rates, the sinc<sup>3</sup> is useful to optimize the settling time. The benefit of the sinc<sup>4</sup> at low update rates is the superior 50 Hz/60 Hz rejection. At the higher update rates, the sinc<sup>4</sup> filter gives best noise performance. For applications that require all conversions to be settled, the AD7190 includes a zero-latency feature.

The part operates with a power supply from 3 V to 5.25 V. It consumes a current of 6 mA. It is housed in a 24-lead TSSOP package.

<sup>1</sup> Temperature range: -40°C to +105°C.
 <sup>2</sup> Specification is not production tested but is supported by characterization data at initial product release.
 <sup>3</sup> Following a calibration, this error will be in the order of the noise for the programmed gain and update rate selected.

<sup>4</sup> Recalibration at any temperature will remove these errors. <sup>5</sup> Full-scale error applies to both positive and negative full-scale and applies at the factory calibration conditions (AV<sub>DD</sub> = 5 V, gain = 1,  $T_A = 25^{\circ}$ C). <sup>6</sup> REJ60 is a bit in the Mode Register. When the update rate is set to 50 Hz, setting REJ60 to '1' places a notch at 60 Hz, allowing simultaneous 50 Hz/60 Hz rejection. <sup>7</sup> Digital inputs equal to  $DV_{DD}$  or GND.

### **TIMING CHARACTERISTICS**

AV<sub>DD</sub> = 3 V to 5.25 V; DV<sub>DD</sub> = 2.7 V to 5.25 V; GND = 0 V, Input Logic 0 = 0 V, Input Logic 1 = DV<sub>DD</sub>, unless otherwise noted.

| Parameter <sup>1, 2</sup> | Limit at T <sub>MIN</sub> , T <sub>MAX</sub> (B Version) | Unit   | Conditions/Comments   |
|---------------------------|--|--------|---|
| t <sub>3</sub>            | 100  | ns min | SCLK high pulse width                                       |
| t <sub>4</sub>            | 100  | ns min | SCLK low pulse width  |
| Read Operation            |  |        |   |

| t <sub>7</sub>            | 10   | ns min | SCLK inactive edge to DOUT/RDY high                         |
| Write Operation           |  |        |   |
| t <sub>8</sub>            | 0  | ns min | CS falling edge to SCLK active edge setup time <sup>4</sup> |
| t <sub>9</sub>            | 30   | ns min | Data valid to SCLK edge setup time                          |
| t <sub>10</sub>           | 25   | ns min | Data valid to SCLK edge hold time                           |
| <b>t</b> 11               | 0  | ns min | CS rising edge to SCLK edge hold time                       |

<sup>1</sup> Sample tested during initial release to ensure compliance. All input signals are specified with  $t_R = t_F = 5$  ns (10% to 90% of DV<sub>DD</sub>) and timed from a voltage level of 1.6 V. <sup>2</sup> See Figure 3 and Figure 4.

 $^3$  These numbers are measured with the load circuit shown in Figure 2 and defined as the time required for the output to cross the V<sub>0L</sub> or V<sub>0H</sub> limits.

<sup>4</sup> SCLK active edge is falling edge of SCLK.

<sup>5</sup> These numbers are derived from the measured time taken by the data output to change 0.5 V when loaded with the circuit shown in Figure 2. The measured number is then extrapolated back to remove the effects of charging or discharging the 50 pF capacitor. This means that the times quoted in the timing characteristics are the true bus relinquish times of the part and, as such, are independent of external bus loading capacitances.

<sup>6</sup> RDY returns high after a read of the ADC. In single conversion mode and continuous conversion mode, the same data can be read again, if required, while RDY is high, although care should be taken to ensure that subsequent reads do not occur close to the next output update. In continuous read mode, the digital word can be read only once.

Figure 2. Load Circuit for Timing Characterization

### **TIMING DIAGRAMS**

### **ABSOLUTE MAXIMUM RATINGS**

 $T_A = 25^{\circ}C$ , unless otherwise noted.

### Table 3.

| Parameter                       | Rating                             |
|---------------------------------|------------------------------------|
| AV <sub>DD</sub> to GND         | –0.3 V to +6.5 V                   |
| DV <sub>DD</sub> to GND         | –0.3 V to +6.5 V                   |
| Analog Input Voltage to GND     | -0.3 V to AV <sub>DD</sub> + 0.3 V |
| Reference Input Voltage to GND  | -0.3 V to AV <sub>DD</sub> + 0.3 V |
| Digital Input Voltage to GND    | -0.3 V to DV <sub>DD</sub> + 0.3 V |
| Digital Output Voltage to GND   | -0.3 V to DV <sub>DD</sub> + 0.3 V |
| AIN/Digital Input Current       | 10 mA                              |
| Operating Temperature Range     | -40°C to +105°C                    |
| Storage Temperature Range       | –65°C to +150°C                    |
| Maximum Junction Temperature    | 150°C                              |
| TSSOP                           |                                    |
| $\theta_{JA}$ Thermal Impedance | 97.9°C/W                           |
| $\theta_{JC}$ Thermal Impedance | 14°C/W                             |
| Lead Temperature, Soldering     |                                    |
| Vapor Phase (60 sec)            | 215°C                              |
| Infrared (15 sec)               | 220°C                              |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### **ESD CAUTION**

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

### **PIN CONFIGURATION AND FUNCTION DESCRIPTIONS**

#### **Table 4. Pin Function Descriptions**

| Pin No. | Mnemonic     | Description   |
|---------|--------------|---|
| 1       | MCLK1        | When the master clock for the device is provided externally by a crystal, the crystal is connected between MCLK1 and MCLK2.   |
| 2       | MCLK2        | Master Clock signal for the device. The AD7190 has an internal 4.92 MHz clock. This internal clock can be made available on the MCLK2 pin.<br>The clock for the AD7190 can be provided externally also in the form of a crystal or external clock. A crystal can be tied across the MCLK1 and MCLK2 pins. Alternatively, the MCLK2 pin can be driven with a CMOS-compatible clock and MCLK1 left unconnected.                             |
| 3       | SCLK         | Serial Clock Input. This serial clock input is for data transfers to and from the ADC. The SCLK has a Schmitt-<br>triggered input, making the interface suitable for opto-isolated applications. The serial clock can be<br>continuous with all data transmitted in a continuous train of pulses. Alternatively, it can be a<br>noncontinuous clock with the information being transmitted to or from the ADC in smaller batches of data. |
| 4       | CS           | Chip Select Input. This is an active low logic input used to select the ADC. $\overline{CS}$ can be used to select the ADC in systems with more than one device on the serial bus or as a frame synchronization signal in communicating with the device. $\overline{CS}$ can be hardwired low, allowing the ADC to operate in 3-wire mode with SCLK, DIN, and DOUT used to interface with the device.                                     |
| 5       | Р3           | Digital Output Pin. This pin can function as a general purpose output bit referenced between AV <sub>DD</sub> and AGND.   |
| 6       | P2           | Digital Output Pin. This pin can function as a general purpose output bit referenced between AV <sub>DD</sub> and AGND.   |
| 7       | P1/REFIN2(+) | Digital Output Pin/Positive Reference Input.  |
|         |              | This pin functions as a general purpose output bit referenced between $AV_{DD}$ and AGND.   |
|         |              | When REFSEL = 1, this pin functions as REFIN2(+). An external reference can be applied between REFIN2(+) and REFIN2(-). REFIN2(+) can lie anywhere between $AV_{DD}$ and $GND + 1$ V. The nominal reference voltage, (REFIN2(+) – REFIN2(-)), is $AV_{DD}$ , but the part functions with a reference from 1 V to $AV_{DD}$ .  |
| 8       | P0/REFIN2(-) | Digital Output Pin/Negative Reference Input.  |
|         |              | This pin functions as a general purpose output bit referenced between AV <sub>DD</sub> and AGND.<br>When REFSEL = 1, this pin functions as REFIN2(-). This reference input can lie anywhere between GND and $AV_{DD} - 1 V$ .   |
| 9       | NC           | No Connect. This pin should be tied to AGND.  |
| 10      | AINCOM       | Analog inputs AIN1 to AIN4 are referenced to this input when configured for pseudo-differential operation.  |
| 11      | AIN1         | Analog Input. It can be configured as the positive input of a fully differential input pair when used with AIN2 or as a pseudo-differential input when used with AINCOM.  |
| 12      | AIN2         | Analog Input. It can be configured as the negative input of a fully differential input pair when used with AIN1 or as a pseudo-differential input when used with AINCOM.  |
| 13      | AIN3         | Analog Input. It can be configured as the positive input of a fully differential input pair when used with  |

| Pin No. | Mnemonic         | Description  |
|---------|------------------|--|
|         |                  | AIN4 or as a pseudo-differential input when used with AINCOM.  |
| 14      | AIN4             | Analog Input. It can be configured as the negative input of a fully differential input pair when used with AIN3 or as a pseudo-differential input when used with AINCOM.   |
| 15      | REFIN1(+)        | Positive Reference Input. An external reference can be applied between REFIN1(+) and REFIN1(-).<br>REFIN1(+) can lie anywhere between AV <sub>DD</sub> and GND + 1 V. The nominal reference voltage, (REFIN1(+) – REFIN1(-)), is AV <sub>DD</sub> , but the part functions with a reference from 1 V to AV <sub>DD</sub> .   |
| 16      | REFIN1(-)        | Negative Reference Input. This reference input can lie anywhere between GND and $AV_{DD} - 1 V$ .  |
| 17      | BPDSW            | Low Side Power Switch to AGND.   |
| 18      | AGND             | Analog Ground Reference Point.   |
| 19      | DGND             | Digital Ground Reference Point.  |
| 20      | AV <sub>DD</sub> | Analog Supply Voltage, 3 V to 5.25 V. $AV_{DD}$ is independent of $DV_{DD}$ . Therefore $DV_{DD}$ can be operated at 3 V with $AV_{DD}$ at 5 V or vice versa.  |
| 21      | DV <sub>DD</sub> | Digital Supply Voltage, 2.7 V to 5.25 V. DV <sub>DD</sub> is independent of AV <sub>DD</sub> . Therefore AV <sub>DD</sub> can be operated at 3 V with DV <sub>DD</sub> at 5 V or vice versa.   |
| 22      | SYNC             | Logic Input that allows for synchronization of the digital filters and analog modulators when using a number of AD7190 devices. While SYNC is low, the nodes of the digital filter, the filter control logic and the calibration control logic are reset and the analog modulator is also held in its reset state. SYNC does not affect the digital interface but does reset RDY to a high state if it is low. SYNC has a pull- up resistor internally to DV <sub>DD</sub> .   |
| 23      | DOUT/RDY         | Serial Data Output/Data Ready Output. DOUT/RDY serves a dual purpose. It functions as a serial data output pin to access the output shift register of the ADC. The output shift register can contain data from any of the on-chip data or control registers. In addition, DOUT/RDY operates as a data ready pin, going low to indicate the completion of a conversion. If the data is not read after the conversion, the pin will go high before the next update occurs.<br>The DOUT/RDY falling edge can be used as an interrupt to a processor, indicating that valid data is available. With an external serial clock, the data can be read using the DOUT/RDY pin. With CS low, the data/control word information is placed on the DOUT/RDY pin on the SCLK falling edge and is valid on the SCLK rising edge. |
| 24      | DIN              | Serial Data Input to the Input Shift Register on the ADC. Data in this shift register is transferred to the control registers within the ADC, the register selection bits of the communications register identifying the appropriate register.   |

## **RMS NOISE AND RESOLUTION SPECIFICATIONS**

The AD7190 can be operated with chop enabled or chop disabled. With chop enabled, the settling time is two times the conversion time. The offset is continuously removed by the ADC leading to low offset and low offset drift. With chop disabled, higher update rates can be achieved from the ADC. The settling time is three times (sinc<sup>3</sup>) or four times (sinc<sup>4</sup>) the selected update rate. With chop disabled, the offset is not removed by the ADC. The offset and offset drift is comparable between chop enabled and chop disabled for gains of 32 or higher. For lower gains, however, periodic offset calibrations may be required to remove offset due to drift.

### SINC<sup>4</sup> FILTER

The sinc<sup>4</sup> filter optimizes the 50 Hz/60 Hz rejection. At the higher update rates, it also gives better rms noise performance compared with the sinc<sup>3</sup> filter.

### **CHOP DISABLED**

Table 5 shows the rms noise of the AD7190 for some of the update rates and gain settings with chop disabled. The numbers given are for the bipolar input range with the external 5 V reference. These numbers are typical and are generated with a differential input voltage of 0 V. Table 6 shows the effective resolution while the output peak-to-peak (p-p) resolution is listed in brackets. It is important to note that the effective resolution is calculated using the rms noise, while the p-p resolution represents the resolution for which there will be no code flicker. These numbers are typical and are rounded to the nearest half-LSB.

| Filter Word<br>(Decimal) | Update<br>Rate (Hz) | Gain of 1 | Gain of 8 | Gain of 16 | Gain of 32 | Gain of 64 | Gain of 128 |
|--------------------------|---------------------|-----------|-----------|------------|------------|------------|-------------|
| 1023                     | 4.7                 | 174       | 24.71     | 12.65      | 10         | 8.3        | 7           |

Table 7 shows the AD7190's rms noise for some of the update rates and gain settings. The numbers given are for the bipolar input range with an external 5 V reference. These numbers are typical and are generated with a differential input voltage of 0 V. Table 8 shows the effective resolution, while the output peak-topeak (p-p) resolution is listed in brackets. It is important to note that the effective resolution is calculated using the rms noise, while the p-p resolution is calculated based on peak-to-peak noise. The p-p resolution represents the resolution for which there will be no code flicker. These numbers are typical and are rounded to the nearest half-LSB.

| Filter<br>Word<br>(Decimal) | Update<br>Rate (Hz) | Gain of 1 | Gain of 8 | Gain of 16 | Gain of 32 | Gain of 64 | Gain of 128 |

### SINC<sup>3</sup> FILTER

For a given update rate, the sinc<sup>3</sup> filter has lower settling time than the sinc<sup>3</sup> filter. At low update rates, the rms noise is comparable between the sinc<sup>3</sup> filter and the sinc<sup>4</sup> filter. So, the user can optimize the settling time without compromising the rms noise. At high update rates, the sinc<sup>4</sup> filter is needed for optimum performance of the AD7190.

### **CHOP DISABLED**

Table 9 shows the rms noise of the AD7190 for some of the update rates and gain settings with chop disabled. The

### **Preliminary Technical Data**

numbers given are for the bipolar input range with the external 5 V reference. These numbers are typical and are generated with a differential input voltage of 0 V. Table 10 shows the effective resolution while the output peak-to-peak (p-p) resolution is listed in brackets. It is important to note that the effective resolution is calculated using the rms noise, while the p-p resolution is calculated based on peak-to-peak noise. The p-p resolution represents the resolution for which there will be no code flicker. These numbers are typical and are rounded to the nearest half-LSB.

## **TYPICAL PERFORMANCE CHARACTERISTICS**

Figure 6.

Figure 7.

Figure 9.

Figure 10.

### **ON-CHIP REGISTERS**

The ADC is controlled and configured via a number of on-chip registers, which are described on the following pages. In the following descriptions, *set* implies a Logic 1 state and *cleared* implies a Logic 0 state, unless otherwise noted.

### **COMMUNICATIONS REGISTER**

#### (RS2, RS1, RS0 = 0, 0, 0)

The communications register is an 8-bit write-only register. All communications to the part must start with a write operation to the communications register. The data written to the communications register determines whether the next operation is a read or write operation, and to which register this operation takes place. For read or write operations, once the subsequent read or write operation to the selected register is complete, the interface returns to where it expects a write operation to the communications register. This is the default state of the interface and, on power-up or after a reset, the ADC is in this default state waiting for a write operation to the communications register. In situations where the interface sequence is lost, a write operation of at least 40 serial clock cycles with DIN high returns the ADC to this default state by resetting the entire part. Table 13 outlines the bit designations for the communications register. CR0 through CR7 indicate the bit location, CR denoting the bits are in the communications register. CR7 denotes the first bit of the data stream. The number in brackets indicates the poweron/reset default status of that bit.

| CR7    | CR6                 | CR5    | CR4    | CR3    | CR2      | CR1  | CR0  |
|--------|---------------------|--------|--------|--------|----------|------|------|
| WEN(0) | R/ <del>W</del> (0) | RS2(0) | RS1(0) | RS0(0) | CREAD(0) | 0(0) | 0(0) |

#### Table 13. Communications Register Bit Designations

| <b>Bit Location</b> | Bit Name   | Description   |
|---------------------|------------|---|
| CR7                 | WEN        | Write Enable Bit. A 0 must be written to this bit so that the write to the communications register actually occurs. If a 1 is the first bit written, the part will not clock on to subsequent bits in the register. It will stay at this bit location until a 0 is written to this bit. Once a 0 is written to the WEN bit, the next seven bits will be loaded to the communications register.  |
| CR6                 | R/W        | A 0 in this bit location indicates that the next operation will be a write to a specified register. A 1 in this position indicates that the next operation will be a read from the designated register.   |
| CR5 to CR3          | RS2 to RS0 | Register Address Bits. These address bits are used to select which registers of the ADC are being selected during this serial interface communication. See Table 14.  |
| CR2                 | CREAD      | Continuous Read of the Data Register. When this bit is set to 1 (and the data register is selected), the serial interface is configured so that the data register can be continuously read, that is, the contents of the data register are automatically placed on the DOUT pin when the SCLK pulses are applied after the RDY pin goes low to indicate that a conversion is complete. The communications register does not have to be written to for subsequent data reads. To enable continuous read, the instruction 01011100 must be written to the communications register. To disable continuous read, the instruction 01011000 must be written to the communications register while the RDY pin is low. While continuous read is enabled, the ADC monitors activity on the DIN line so that it can receive the instruction to disable continuous read. Additionally, a reset will occur if 40 consecutive 1s are seen on DIN. Therefore, DIN should be held low until an instruction is to be written to the device. |
| CR1 to CR0          | 0          | These bits must be programmed to Logic 0 for correct operation.   |

#### Table 14. Register Selection

| RS2 | RS1 | RS0 | Register   | Register Size   |
|-----|-----|-----|--|-----------------|
| 0   | 0   | 0   | Communications Register During a Write Operation   | 8-bit           |
| 0   | 0   | 0   | Status Register During a Read Operation            | 8-bit           |
| 0   | 0   | 1   | Mode Register                                      | 24-bit          |
| 0   | 1   | 0   | Configuration Register                             | 24-bit          |
| 0   | 1   | 1   | Data Register / Data Register + Status Information | 24-bit / 32-bit |
| 1   | 0   | 0   | ID Register  | 8-bit           |
| 1   | 0   | 1   | GPOCON Register                                    | 8-bit           |
| 1   | 1   | 0   | Offset Register                                    | 24-bit          |
| 1   | 1   | 1   | Full-Scale Register                                | 24-bit          |

### **STATUS REGISTER**

### (RS2, RS1, RS0 = 0, 0, 0; Power-On/Reset = 0x80)

The status register is an 8-bit read-only register. To access the ADC status register, the user must write to the communications register, select the next operation to be a read, and load Bit RS2, Bit RS1, and Bit RS0 with 0. Table 15 outlines the bit designations for the status register. SR0 through SR7 indicate the bit locations, SR denoting the bits are in the status register. SR7 denotes the first bit of the data stream. The number in brackets indicates the power-on/reset default status of that bit.

| SR7    | SR6    | SR5      | SR4       | SR3     | SR2     | SR1     | SR0     |
|--------|--------|----------|-----------|---------|---------|---------|---------|
| RDY(1) | ERR(0) | NOREF(0) | PARITY(0) | CHD3(0) | CHD2(0) | CHD1(0) | CHD0(0) |

#### Table 15. Status Register Bit Designations

| <b>Bit Location</b> | Bit Name        | Description  |
|---------------------|-----------------|--|
| SR7                 | RDY             | Ready Bit for ADC. <i>Cleared</i> when data is written to the ADC data register. The RDY bit is set automatically after the ADC data register has been read or a period of time before the data register is updated with a new conversion result to indicate to the user not to read the conversion data. It is also set when the part is placed in power-down mode, idle mode or when SYNC is taken low.  |
|                     |                 | The end of a conversion is also indicated by the DOUT/RDY pin. This pin can be used as an alternative to the status register for monitoring the ADC for conversion data.   |
| SR6                 | ERR             | ADC Error Bit. This bit is written to at the same time as the RDY bit. Set to indicate that the result written to the ADC data register has been clamped to all 0s or all 1s. Error sources include overrange, underrange, or the absence of a reference voltage. Cleared by a write operation to start a conversion.  |
| SR5                 | NOREF           | No External Reference Bit. <i>Set</i> to indicate that the selected reference (REFIN1 or REFIN2) is at a voltage that is below a specified threshold. When set, conversion results are clamped to all ones. <i>Cleared</i> to indicate that a valid reference is applied to the selected reference pins. The NOXREF bit is enabled by setting the REF_DET bit in the configuration register to 1. The ERR bit is also set if the voltage applied to the selected reference input is invalid. |
| SR4                 | PARITY          | Parity Check of Data Register.   |
|                     |                 | If the ENPAR bit is set, the PARITY bit is set if there is an odd number of 1s in the data register. It is cleared if there is an even number of 1s in the data register. The DAT_STA bit should be set when the parity check is used. When the DAT_STA bit is set, the contents of the status register are transmitted along with the data for each data register read.   |
| SR3 to SR0          | CHD3 to<br>CHD0 | These bits indicate which channel corresponds to the data register contents. They do not indicate which channel is presently being converted but indicate which channel was selected when the conversion contained in the data register was being generated.   |

### **MODE REGISTER**

#### (RS2, RS1, RS0 = 0, 0, 1; Power-On/Reset = 0x080060)

The mode register is a 24-bit register from which data can be read or to which data can be written. This register is used to select the operating mode, the update rate, and the clock source. Table 16 outlines the bit designations for the mode register. MR0 through MR23 indicate the bit locations, MR denoting the bits are in the mode register. MR23 denotes the first bit of the data stream. The number in brackets indicates the power-on/reset default status of that bit. Any write to the mode register resets the modulator and filter and sets the RDY bit.

| MR23     | MR22   | MR21     | MR20       | MR19      | MR18     | MR17   | MR16   |
|----------|--------|----------|------------|-----------|----------|--------|--------|
| MD2(0)   | MD1(0) | MD0(0)   | DAT_STA(0) | CLK1(1)   | CLK0(0)  | 0      | 0      |
| MR15     | MR14   | MR13     | MR12       | MR11      | MR10     | MR9    | MR8    |
| SINC3(0) | 0      | ENPAR(0) | 0          | SINGLE(0) | REJ60(0) | FS9(0) | FS8(0) |
| MR7      | MR6    | MR5      | MR4        | MR3       | MR2      | MR1    | MRO    |
| FS7(0)   | FS6(1) | FS5(1)   | FS4(0)     | FS3(0)    | FS2(0)   | FS1(0) | FS0(0) |

### Table 16. Mode Register Bit Designations

| <b>Bit Location</b> | Bit Name   | Description  |
|---------------------|------------|--|
| MR23 to MR21        | MD2 to MD0 | Mode Select Bits. These bits select the operational mode of the AD7190 (see Table 17).                 |
| MR20                | DAT_STA    | Transmit status register contents after each data register read.                                       |
|                     |            | When DAT_STA is set, the contents of the status register are transmitted along with each data register |

| Bit Location         | Bit Name     | Description   |               |  |  |  |  |  |
|----------------------|--------------|---|---------------|--|--|--|--|--|
|                      |              |   |               | seful when several channels are selected as the status register identifies the   |  |  |  |  |
|                      |              | channel to which the data register value corresponds.   |               |  |  |  |  |  |
| MR19 to MR18         | CLK1 to CLK0 |   |               | select the clock source for the AD7190. Either the on-chip 4.92 MHz clock can  |  |  |  |  |
|                      |              |   |               | l clock can be used. The ability to use an external clock allows several AD7190  |  |  |  |  |
|                      |              | devices to be synchronized. Also, 50 Hz/60 Hz rejection is improved when an accurate external clock drives the AD7190.  |               |  |  |  |  |  |
|                      |              | CLK1  |               |  |  |  |  |  |
|                      |              | 0   | 0             | External crystal used. The external crystal is connected from MCLK1 to MCLK2   |  |  |  |  |
|                      |              | 0   | 1             | External clock used. The external clock is applied to the MCLK2 pin.   |  |  |  |  |
|                      |              | 1   | 0             | Internal 4.92 MHz clock. Pin MCLK2 is tri-stated.  |  |  |  |  |
|                      |              | 1   | 1             | Internal 4.92 MHz clock. The internal clock is available on MCLK2.   |  |  |  |  |
| MR17 to MR16         | 0            |   | must be pro   |  |  |  |  |  |
| MR17 to MR10<br>MR15 | SINC3        |   | r Select pin. | ogrammed with a Logic 0 for correct operation.   |  |  |  |  |
| IVIRIO               | SINCS        |   |               | d, the sinc⁴ filter is used (default value).   |  |  |  |  |
|                      |              |   |               |  |  |  |  |  |
|                      |              |   |               | sinc <sup>3</sup> filter is used.  |  |  |  |  |
|                      |              | disabled.<br>has a settl  | For a given u | $^{-3}$ filter compared to the sinc <sup>4</sup> filter is its lower settling time when chop is update rate $f_{ADC}$ , the sinc <sup>3</sup> filter has a settling time of $f_{ADC}/3$ while the sinc <sup>4</sup> filter $f_{ADC}/4$ . The sinc <sup>4</sup> filter, due to its deeper notches, gives better 50 Hz/60 Hz |  |  |  |  |
|                      |              | rejection.  |               |  |  |  |  |  |
|                      |              | At low update rates, both filters give similar rms noise and similar no missing codes for a given update rate. At higher update rates (FS values less than 5), the sinc <sup>4</sup> filter gives better performance than the sinc <sup>3</sup> filter for rms noise and no missing codes.  |               |  |  |  |  |  |
| MR14                 | 0            | This bit m  | ust be progr  | rammed with a Logic 0 for correct operation.   |  |  |  |  |
| MR13                 | ENPAR        | Enable Parity bit.  |               |  |  |  |  |  |
|                      |              | When ENPAR is set, parity checking on the data register is enabled. The DAT_STA bit should be set   |               |  |  |  |  |  |
|                      |              |   |               | x is used. When the DAT_STA bit is set, the contents of the status register are h the data for each data register read.  |  |  |  |  |
| MR12                 | 0            | This bit must be programmed with a Logic 0 for correct operation.   |               |  |  |  |  |  |
| MR11                 | SINGLE       | Single Cycle Conversion Enable Bit.   |               |  |  |  |  |  |
|                      |              | When this bit is set, the AD7190 allows the complete settling time to perform each conversion. So, the device functions as a zero-latency ADC.  |               |  |  |  |  |  |
| MR10                 | REJ60        | Enables a notch at 60 Hz when the update rate is equal to 50 Hz.  |               |  |  |  |  |  |
|                      |              |   |               | lter notch is placed at 60 Hz when the update rate selected is 50 Hz. This allows<br>0 Hz rejection.   |  |  |  |  |
| MR9 to MR0           | FS9 to FS0   | Filter Upd  | ate Rate Sele | ect Bits.  |  |  |  |  |
|                      |              | The 10 bits of data programmed into these bits determine the filter cut-off frequency, the position of the first notch of the filter and the data rate for the part. In association with the gain selection, it also determines the output noise (and hence the effective resolution) of the device. When chop is disable and continuous conversion mode is selected, the first notch of the filter occurs at a frequency determined by the relationship: |               |  |  |  |  |  |
|                      |              | filter first notch frequency = (fmod/64)/FS<br>where FS is the decimal equivalent of the code in bits FS0 to FS9 and is in the range 1 to 1023 and  |               |  |  |  |  |  |
|                      |              | fmod is th  | e modulatoi   | r frequency which is equal to MCLK/16. With the nominal MCLK of 4.92 MHz, this frequency range from 4.69 Hz to 4.8 kHz.  |  |  |  |  |
|                      |              |   |               | tch frequency, as well as the selected gain, impacts resolution. Tables 5 through  |  |  |  |  |
|                      |              |   |               | he filter notch frequency and gain on the effective resolution of the AD7190. The  |  |  |  |  |
|                      |              |   |               | ffective conversion time) for the device is equal to the frequency selected for the  |  |  |  |  |
|                      |              |   |               | . For example, if the first notch of the filter is selected at 50 Hz then a new word   |  |  |  |  |
|                      |              | is available at a 50 Hz rate or every 20 ms. If the first notch is at 1.2 kHz, a new word is available every 0.83 ms. The settling time of the filter to a full-scale step input change is worst case (N + 1)/(output   |               |  |  |  |  |  |
|                      |              |   |               | when the sinc <sup>3</sup> filter is selected and N = 4 when the sinc <sup>4</sup> filter is selected. For   |  |  |  |  |
|                      |              |   |               | t filter notch at 50 Hz, the settling time of the filter to a full-scale step input  |  |  |  |  |
|                      |              | change is   | 100 ms max    | when $N = 4$ . This settling time can be reduced to N/(output data rate) by  |  |  |  |  |
|                      |              |   |               | p input change to a reset of the digital filter. In other words, if the step input   |  |  |  |  |
|                      |              |   |               | YNC input low, the settling time will be N/(output data rate) from when SYNC   |  |  |  |  |
|                      |              | the SYNC  | status as the | ge of channel takes place, the settling time is N/(output data rate) regardless of<br>e part issues an internal reset command when requested to change channels.   |  |  |  |  |
|                      |              | The –3 dB   | frequency is  | s determined by the programmed first notch frequency according to the  |  |  |  |  |

| Bit Location | Bit Name | Description   |
|--------------|----------|---|
|              |          | relationship:   |
|              |          | filter $-3 \text{ dB}$ frequency = 0.23 x filter first notch frequency.   |
|              |          | When chop is enabled, the conversion time equals  |
|              |          | Conversion rate = (fmod/64)/(NxFS)  |
|              |          | where FS is the decimal equivalent of the code in bits FS0 to FS9 and is in the range 1 to 1023 and fmod is the modulator frequency which is equal to MCLK/16. With the nominal MCLK of 4.92 MHz, this results in a conversion rate from 4.69/N Hz to 4.8/N kHz where N is the order of the sinc filter. The first notch in the frequency response is placed at conversion rate/2. The settling time is equal to 2 x conversion time. |

### Table 17. Operating Modes

| MD2 | MD1 | MD0 | Mode  |
|-----|-----|-----|---|
| 0   | 0   | 0   | Continuous Conversion Mode (Default).   |
|     |     |     | In continuous conversion mode, the ADC continuously performs conversions and places the result in the data register. RDY goes low when a conversion is complete. The user can read these conversions by setting the CREAD bit in the communications register to '1' which enables continuous read. When continuous read is enabled, the conversions are automatically placed on the DOUT line when SCLK pulses are applied. Alternatively, the user can instruct the ADC to output each conversion by writing to the communications register.<br>After power-on, a reset or a re-configuration of the ADC, the complete settling time of the filter is required to generate the first valid conversion. Subsequent conversions are available at the selected update rate which is dependent on the set of the se |
| 0   | 0   | 1   | dependent on filter choice.<br>Single Conversion Mode.  |
| 0   | 0   | 1   | When single conversion mode is selected, the ADC powers up and performs a single conversion on the selected channel. The oscillator requires 1 ms to power up and settle. The ADC then performs the conversion which requires the complete settling time of the filter. The conversion result is placed in the data register, RDY goes low, and the ADC returns to power-down mode. The conversion remains in the data register and RDY remains active (low) until the data is read or another conversion is performed.   |
| 0   | 1   | 0   | Idle Mode.  |
|     |     |     | In idle mode, the ADC filter and modulator are held in a reset state although the modulator clocks are still provided.  |
| 0   | 1   | 1   | Power-Down Mode.  |
|     |     |     | In power-down mode, all the AD7190 circuitry, except the power switch, is powered down. The power switch remains active as the user may need to power up the sensor prior to powering up the AD7190 for settling reasons. The external crystal, if present, is left active.   |
| 1   | 0   | 0   | Internal Zero-Scale Calibration.  |
|     |     |     | An internal short is automatically connected to the input. RDY goes high when the calibration is initiated and returns low when the calibration is complete. The ADC is placed in idle mode following a calibration. The measured offset coefficient is placed in the offset register of the selected channel.  |
| 1   | 0   | 1   | Internal Full-Scale Calibration.  |
|     |     |     | A full-scale input voltage is automatically connected to the input for this calibration.  |
|     |     |     | RDY goes high when the calibration is initiated and returns low when the calibration is complete. The ADC is placed in idle mode following a calibration. The measured full-scale coefficient is placed in the full-scale register of the selected channel.   |
|     |     |     | A full-scale calibration is required each time the gain of a channel is changed to minimize the full-scale error.   |
| 1   | 1   | 0   | System Zero-Scale Calibration.  |
|     |     |     | User should connect the system zero-scale input to the channel input pins as selected by the CH7 to CH0 bits. RDY goes high when the calibration is initiated and returns low when the calibration is complete. The ADC is placed in idle mode following a calibration. The measured offset coefficient is placed in the offset register of the selected channel.   |
| 1   | 1   | 1   | System Full-Scale Calibration.  |
|     |     |     | User should connect the system full-scale input to the channel input pins as selected by the CH7–CH0 bits.  |
|     |     |     | RDY goes high when the calibration is initiated and returns low when the calibration is complete. The ADC is placed in idle mode following a calibration. The measured full-scale coefficient is placed in the full-scale register of the selected channel.   |
|     |     |     | A full-scale calibration is required each time the gain of a channel is changed.  |
|     | L   |     |   |

### **CONFIGURATION REGISTER**

### (RS2, RS1, RS0 = 0, 1, 0; Power-On/Reset = 0x000117)

The configuration register is a 24-bit register from which data can be read or to which data can be written. This register is used to configure the ADC for unipolar or bipolar mode, enable or disable the buffer, enable or disable the burnout currents, select the gain, and select the analog input channel.

Table 18 outlines the bit designations for the filter register. CON0 through CON23 indicate the bit locations. CON denotes that the bits are in the configuration register. CON23 denotes the first bit of the data stream. The number in brackets indicates the power-on/reset default status of that bit.

| CON23   | CON22     | CON21  | CON20     | CON19               | CON18  | CON17  | CON16  |
|---------|-----------|--------|-----------|---------------------|--------|--------|--------|
| CHOP(0) | 0(0)      | 0(0)   | REFSEL(0) | 0(0)                | 0(0)   | 0(0)   | (0)    |
| CON15   | CON14     | CON13  | CON12     | CON11               | CON10  | CON9   | CON8   |
| CH7(0)  | CH6(0)    | CH5(0) | CH4(0)    | CH3(0)              | CH2(0) | CH1(0) | CH0(1) |
| CON7    | CON6      | CON5   | CON4      | CON3                | CON2   | CON1   | CON0   |

#### Table 18. Configuration Register Bit Designations

| Bit               |            |  |  |  |  |  |  |  |
|-------------------|------------|--|--|--|--|--|--|--|
| Location          | Bit Name   | Description  |  |  |  |  |  |  |
| CON23             | CHOP       | Chop Enable Bit.   |  |  |  |  |  |  |
|                   |            | When CHOP is cl  | eared, chop is disabled.   |  |  |  |  |  |
|                   |            | When CHOP is se  | et, chop is disabled.  |  |  |  |  |  |
|                   |            | When chop is enabled, the offset and offset drift is continuously removed by the ADC. However, increases the conversion time and settling time of the ADC. For example, when FS = 96 decimes sinc <sup>4</sup> filter is selected, the conversion time with chop enabled equals 80 ms and the settling time 160 ms. With chop disabled, higher conversion rates are allowed. For an SF word of 96 decimes sinc <sup>4</sup> filter selected, the conversion time is 20 ms and the settling time is 80 ms. However, at low periodic calibrations may be required to remove the offset and offset drift. |  |  |  |  |  |  |
| CON22,<br>CON21   | 0          | These bits must b  | be programmed with a Logic 0 for correct operation.  |  |  |  |  |  |
| CON20             | REFSEL     | Reference Select Bits. The reference source for the ADC is selected using these bits.  |  |  |  |  |  |  |
|                   |            | REFSEL   | Reference Voltage  |  |  |  |  |  |

| 1   | Х   | Х   | Х   | Х   | Х   | Х   | Х   | AIN4 – AINCOM | 0111     | 3                |

#### **DATA REGISTER**

#### (RS2, RS1, RS0 = 0, 1, 1; Power-On/Reset = 0x000000)

The conversion result from the ADC is stored in this data register. This is a read-only register. On completion of a read operation from this register, the RDY bit/pin is set. The AD7190 can be configured for 24-bit transfers or 32-bit transfers. When 24-bit transfers are selected, the 24-bit data conversion is transmitted. When 32-bit transfers are selected, the 24-bit conversion is followed by the contents of the status register. When several channels are enabled, the ADC will automatically step between channels. So, 32-bit transmissions are required so that the user can identify the channel from which the conversions originated.

### **GPOCON REGISTER**

### (RS2, RS1, RS0 = 1, 0, 1; Power-On/Reset = 0x00)

The GPOCON register is an 8-bit register from which data can be read or to which data can be written. This register is used to enable the general purpose digital outputs.

Table 20 outlines the bit designations for the GPOCON register. GP0 through GP7 indicate the bit locations. GP denotes that the bits are in the GPOCON register. GP7 denotes the first bit of the data stream. The number in brackets indicates the power-on/reset default status of that bit.

| GP7  | GP6      | GP5       | GP4       | GP3      | GP2      | GP1      | GP0      |
|------|----------|-----------|-----------|----------|----------|----------|----------|
| 0(0) | BPDSW(0) | GP32EN(0) | GP10EN(0) | P3DAT(0) | P2DAT(0) | P1DAT(0) | PODAT(0) |

| Table 20. Reg       | Table 20. Register Bit Designations |  |  |  |  |  |  |
|---------------------|-------------------------------------|--|--|--|--|--|--|
| <b>Bit Location</b> | Bit Name                            | Description  |  |  |  |  |  |
| GP7                 | 0                                   | This bit must be programmed with a Logic 0 for correct operation.  |  |  |  |  |  |
| GP 6                | BPDSW                               | Power Switch Control Bit. <i>Set</i> by user to close the power switch BPDSW to AGND. The power switch can sink up to 30 mA. <i>Cleared</i> by user to open the power switch. When the ADC is placed in power-down mode, the power switch remains active.                              |  |  |  |  |  |
| GP5                 | GP32EN                              | Digital Outputs P3 and P2 Enable.  |  |  |  |  |  |
|                     |                                     | When GP32EN is set, the digital outputs P3 and P2 are active. When GP32EN is cleared, the pins P3 and P2 are tri-stated and bits P3DAT and P2DAT are ignored.  |  |  |  |  |  |
| GP4                 | GP10EN                              | Digital Outputs P1 and P0 Enable.  |  |  |  |  |  |
|                     |                                     | When GP10EN is set, the digital outputs P1 and P0 are active. When GP10EN is cleared, the P1 and P0 outputs are tri-stated and bits P1DAT and P0DAT are ignored. The pins P1 and P0 can be used as a reference input REFIN2 when bit REFSEL in the configuration register is set to 1. |  |  |  |  |  |
| GP3                 | P3DAT                               | Digital Output P3. When GP32EN is <i>set</i> , the P3DAT bit sets the value of the general purpose output pin P3. When P3DAT is high, the output P3 is high. When P3DAT is low, the output P3 is low.  |  |  |  |  |  |
| GP2                 | P2DAT                               | Digital Output P2. When GP32EN is <i>set</i> , the P2DAT bit sets the value of the general purpose output pin P2. When P2DAT is high, the output P2 is high. When P2DAT is low, the output P2 is low.  |  |  |  |  |  |
| GP1                 | P1DAT                               | Digital Output P1. When GP10EN is <i>set</i> , the P1DAT bit sets the value of the general purpose output pin P1. When P1DAT is high, the output P1 is high. When P1DAT is low, the output P1 is low.  |  |  |  |  |  |
| GP0                 | PODAT                               | Digital Output P0. When GP10EN is <i>set</i> , the P0DAT bit sets the value of the general purpose output pin P0. When P0DAT is high, the output P0 is high. When P0DAT is low, the output P0 is low.  |  |  |  |  |  |

### Table 20. Register Bit Designations

#### **OFFSET REGISTER**

#### (RS2, RS1, RS0 = 1, 1, 0; Power-On/Reset = 0x800000)

The offset register holds the offset calibration coefficient for the ADC. The power-on reset value of the offset register is 0x800000. The AD7190 has four offset registers so each channel has a dedicated offset register. Each of these registers is a 24-bit read/write register. This register is used in conjunction with its associated full-scale register to form a register pair. The power-on reset value is automatically overwritten if an internal or system zero-scale calibration is initiated by the user. The AD7190 must be placed in power-down mode or idle mode when writing to the offset register.

### **FULL-SCALE REGISTER**

### (RS2, RS1, RS0 = 1, 1, 1; Power-On/Reset = 0x5XXXX0)

The full-scale register is a 24-bit register that holds the full-scale calibration coefficient for the ADC. The AD7190 has 4 full-scale registers so each channel has a dedicated full-scale register. The full-scale registers are read/write registers. However, when writing to the full-scale registers, the ADC must be placed in power-down mode or idle mode. These registers are configured on power-on with factory-calibrated full-scale calibration coefficients, the calibration being performed at gain = 1. Therefore, every device will have different default coefficients. The default value will be automatically overwritten if an internal or system full-scale calibration is initiated by the user or the full-scale register is written to.
