

18-Bit 250/670 kSPS PulSAR® Bipolar Programmable Inputs ADC

Preliminary Technical Data

AD7631/AD7634

FEATURES

Multiple pins/software programmable input ranges:

$\pm 10V$, $\pm 5V$, $10V$, $5V$

iCMOS™ process technology

Pins or serial SPI input ranges/mode selection

Throughput:

670kSPS (AD7634)

250kSPS (AD7631)

INL: ± 1.75 LSB ($7 \pm$ ppm of full scale)

DNL: $+2/-1$ LSB

18-bit resolution with no missing codes

Dynamic range: 102.5 dB typical

SNR: 101 dB typical

THD: -122 dB typical

5V internal reference: typical drift 7ppm/°C; TEMP output

No pipeline delay (SAR architecture)

Parallel (18, 16- or 8-bit bus) and serial 5 V/3.3 V interface

SPI®-/QSPI™-/MICROWIRE™-/DSP-compatible

Power dissipation:

190 mW @ 670kSPS

75 mW @ 250kSPS

Pb-free 48-lead LQFP and LFCSP (7x7mm) packages

Pin compatible with other PulSAR ADCs

APPLICATIONS

Process control

High speed data acquisition

Digital signal processing

Spectrum analysis

Instrumentation

Communications

GENERAL DESCRIPTION

The AD7631/AD7634 is an 18-bit, charge redistribution successive approximation register (SAR) architecture analog-to-digital converter (ADC) with programmable input ranges and mode selection via a dedicated write only serial interface (or by hardware pin-strapping). The device is fabricated on ADI's patented iCMOS high voltage process. The device contains a high speed 18-bit sampling ADC, an internal conversion clock, an internal reference (and buffer), and both serial and parallel system interface ports. Power consumption is automatically scaled with throughput (AD7634 in Impulse mode), making it ideal for battery-powered applications. It is available in Pb-free, 48-lead packages with operation specified from -40°C to $+85^{\circ}\text{C}$.

PRODUCT HIGHLIGHTS

- Programmable input range and mode selection. Dedicated write only serial port used for selecting input range and mode select (mode select AD7634 only).
- Fast throughput. The AD7634 is 670kSPS and the AD7631 is 250kSPS.
- Superior Linearity. No missing 18-bit code. ± 1.75 LSB typical INL
- Internal Reference. 5 V internal reference with a typical drift of ± 7 ppm/°C and on-chip TEMP sensor.
- Serial or Parallel Interface. Versatile parallel (18, 16- or 8-bit bus) or 2-wire serial interface arrangement compatible with 3.3 V, or 5 V logic.

Without Internal Reference ⁷	AD7634 @ 670kSPS throughput		160		mW
In Power-Down Mode ⁹	PD = high		2		μW
TEMPERATURE RANGE ¹⁰					
Specified Performance	T _{MIN} to T _{MAX}	-40		+85	°C

¹ The inputs are differential anti-phase. Refer to the **Error! Reference source not found.** section.

² Linearity is tested using endnotes, not best fit.

³ LSB means least significant bit. With the 0 to 5V input range, 1 LSB 38.15μV.

⁴ All specifications in dB are referred to a full-scale input FSR. Tested with an input signal at 0.5 dB below full-scale, unless otherwise specified.

⁵ Parallel or serial 18-bit.

⁶ Conversion results are available immediately after completed conversion.

⁷ Tested in parallel reading mode.

⁸ With internal reference, PDREF and PDBUF are low; without internal reference, PDREF and PDBUF are high.

⁹ With all digital inputs forced to OVDD.

¹⁰ Consult sales for extended temperature range.

TIMING SPECIFICATIONS

AVDD = DVDD = 5 V; OVDD = 2.7 V to 5.5 V; VCC = 15V; VEE = -15V; V_{REF} = 5 V; all specifications T_{MIN} to T_{MAX}, unless otherwise noted.

1. Specification is for the device in free air:
48-Lead LQFP; $\theta_{JA} = 91^\circ\text{C/W}$, $\theta_{JC} = 30^\circ\text{C/W}$.
2. Specification is for the device in free air:
48-Lead LFCSP; $\theta_{JA} = 26^\circ\text{C/W}$.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

NOTE
IN SERIAL INTERFACE MODES, THE SYNC, SCLK, AND
SDOUT TIMING ARE DEFINED WITH A MAXIMUM LOAD
 C_L OF 10pF; OTHERWISE, THE LOAD IS 60pF MAXIMUM.

			<table border="1"> <thead> <tr> <th>Interface MODE#</th> <th>MODE1</th> <th>MODE0</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>18-bit interface</td> </tr> <tr> <td>1</td> <td>0</td> <td>1</td> <td>16-bit interface</td> </tr> <tr> <td>2</td> <td>1</td> <td>0</td> <td>8-bit (byte) interface</td> </tr> <tr> <td>3</td> <td>1</td> <td>1</td> <td>Serial interface</td> </tr> </tbody> </table>	Interface MODE#	MODE1	MODE0	Description	0	0	0	18-bit interface	1	0	1	16-bit interface	2	1	0	8-bit (byte) interface	3	1	1	Serial interface
Interface MODE#	MODE1	MODE0	Description																				
0	0	0	18-bit interface																				
1	0	1	16-bit interface																				
2	1	0	8-bit (byte) interface																				
3	1	1	Serial interface																				
5	D0/OB/ $\overline{2C}$	DI/O	When MODE[1:0] = 0 (18-bit interface mode), this pin is Bit 0 of the parallel port data output bus and the data coding is straight binary. In all other modes, this pin allows the choice of straight binary/twos complement. When $\overline{OB/2C}$ is high, the digital output is straight binary; when low, the MSB is inverted resulting in a twos complement output from its internal shift register.																				
6	WARP	DI	AD7634: Conversion Mode Selection. When WARP = high and IMPULSE = low, this selects warp mode. In this mode, the maximum throughput is achievable, and a minimum conversion rate must be applied to guarantee full specified accuracy. When WARP = low and IMPULSE = low, this selects normal mode where full accuracy is maintained independent of the minimum conversion rate.																				
7	IMPULSE	DI	AD7634: Conversion Mode Selection. When IMPULSE = high and WARP = low, this input selects impulse mode, a reduced power mode. In this mode, the power dissipation is approximately scaled proportional to the sampling rate. AD7631: Connect to DGND.																				
8	D1/A0	DI/O	When MODE[1:0] = 0, this pin is Bit 1 of the parallel port data output bus. In all other modes, this input pin controls the form in which data is output as shown in Table 7.																				
9	D2/A1	DI/O	When MODE[1:0] = 0, this pin is Bit 2 of the parallel port data output bus. When MODE[1:0] = 1 or 2, this input pin controls the form in which data is output as shown in Table 7.																				
10	D3	D0	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 3 of the parallel port data output bus. This pin is always an output, regardless of the interface mode.																				

Pin No.	Mnemonic	Type ¹	Description
11, 12	D[4:5] or DIVSCLK[0:1]	DI/O	When MODE[1:0] = 0, 1, or 2, these pins are Bit 4 and Bit 5 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), serial clock division selection. When using serial master read after convert mode (EXT/INT = low, RDC/SDIN = low), these inputs can be used to slow down the internally generated serial clock that clocks the data output. In other serial modes, these pins are high impedance outputs.
13	D6 or EXT/INT	DI/O	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 6 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), serial clock source select. This input is used to select the internally generated (master) or external (slave) serial data clock. When EXT/INT = low, master mode. The internal serial clock is selected on SCLK output. When EXT/INT = high, slave mode. The output data is synchronized to an external clock signal, gated by CS, connected to the SCLK input.
14	D7 or INVSYNC	DI/O	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 7 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), invert sync select. In serial master mode (EXT/INT = low), this input is used to select the active state of the SYNC signal. When INVSYNC = low, SYNC is active high. When INVSYNC = high, SYNC is active low.
15	D8 or INVSCLK	DI/O	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 8 of the parallel port data output bus. When MODE[1:0] = 3, invert SCLK select. In all serial modes, this input is used to invert the SCLK signal.
16	D9 or RDC or SDIN	DI/O	When MODE[1:0] = 0, 1, or 2, this output is used as bit 9 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), read during convert. When using serial master mode (EXT/INT = low), RDC is used to select the read mode. When RDC = high, the previous conversion result is output on SDOOUT during conversion and the period of SCLK changes. When RDC = low (read after convert), the current result can be output on SDOOUT only when the conversion is complete. When MODE[1:0] = 3 (serial mode), serial data in. When using serial slave mode, (EXT/INT = high), SDIN could be used as a data input to daisy-chain the conversion results from two or more ADCs onto a single SDOOUT line. The digital data level on SDIN is output on SDOOUT with a delay of 18 SCLK periods after the initiation of the read sequence.
17	OGND	P	Input/Output Interface Digital Power Ground.
18	OVDD	P	Input/Output Interface Digital Power. Nominally at the same supply as the supply of the host interface (2.7 V to 5V).
19	DVDD	P	Digital Power. Nominally at 5 V.
20	DGND	P	Digital Power Ground.
21	D10 or SDOOUT	DO	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 10 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), serial data output. In serial mode, this pin is used as the serial data output synchronized to SCLK. Conversion results are stored in an on-chip register. The ADC provides the conversion result, MSB first, from its internal shift register. The data format is determined by the logic level of OB/2C. In master mode, EXT/INT = low. SDOOUT is valid on both edges of SCLK. In slave mode, EXT/INT = high: When INVSCLK = low, SDOOUT is updated on SCLK rising edge and valid on the next falling edge. When INVSCLK = high, SDOOUT is updated on SCLK falling edge and valid on the next rising edge.
22	D11 or SCLK	DI/O	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 11 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), serial clock. In all serial modes, this pin is used as the serial data clock input or output, depending upon the logic state of the EXT/INT pin. The active edge where the data SDOOUT is updated depends on the logic state of the INVSCLK pin.
23	D12 or SYNC	DO	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 12 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), frame synchronization. In serial master mode (EXT/INT = low), this output is used as a digital output frame synchronization for use with the internal data clock.

Pin No.	Mnemonic	Type ¹	Description
24	D13 or RDERROR	DO	When a read sequence is initiated and INVS $\overline{\text{SYNC}}$ = low, SYNC is driven high and remains high while SDO $\overline{\text{UT}}$ output is valid. When a read sequence is initiated and INVS $\overline{\text{SYNC}}$ = high, SYNC is driven low and remains low while SDO $\overline{\text{UT}}$ output is valid. When MODE[1:0] = 0, 1, or 2, this output is used as Bit 13 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), read error. In serial slave mode (EXT/ $\overline{\text{INT}}$ = high), this output is used as an incomplete read error flag. If a data read is started and not completed when the current conversion is complete, the current data is lost and RDERROR is pulsed high.
25	D14 or HW/ $\overline{\text{SW}}$	DI/O	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 14 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode) hardware/software select. This input, part of the serial programmable port, is used to select hardware or software input ranges and mode selection.
26	D15 or SPPDATA	DI/O	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 15 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), serial programmable port data. This input is used to write in the serial programmable port data when HW/ $\overline{\text{SW}}$ = low.
27	D16 or SPPCLK	DI/O	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 16 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), serial programmable port clock. This input is used to clock in the data on SPPDATA. The active edge where the data SPPDATA is updated depends on the logic state of the INV $\overline{\text{SCLK}}$ pin.
28	D17 or $\overline{\text{SPPEN}}$	DI/O	When MODE[1:0] = 0, 1, or 2, this output is used as Bit 17 of the parallel port data output bus. When MODE[1:0] = 3 (serial mode), serial programmable port enable. Asserting this input enables the serial programmable port.
29	BUSY	DO	Busy Output. Transitions high when a conversion is started and remains high until the conversion is complete and the data is latched into the on-chip shift register. The falling edge of BUSY can be used as a data-ready clock signal.
30	TEN	DI	10 Volt Input Range. Refer to Table 8. When MODE[1:0] = 0, 1, or 2, this input is used to select the 10V input range. When MODE[1:0] = 3 (serial mode), and HW/ $\overline{\text{SW}}$ = high, driving TEN high selects the 10 Volt input range. HW/ $\overline{\text{SW}}$ = low, the input range is programmed with the serial programmable port and this pin is a don't care.
31	$\overline{\text{RD}}$	DI	Read Data. When $\overline{\text{CS}}$ and $\overline{\text{RD}}$ are both low, the interface parallel or serial output bus is enabled.
32	$\overline{\text{CS}}$	DI	Chip Select. When $\overline{\text{CS}}$ and $\overline{\text{RD}}$ are both low, the interface parallel or serial output bus is enabled. $\overline{\text{CS}}$ is also used to gate the external clock in slave serial mode.
33	RESET	DI	Reset Input. When high, resets the ADC. Current conversion, if any, is aborted. Falling edge of RESET enables the calibration mode indicated by pulsing BUSY high. If not used, this pin can be tied to DGND.
34	PD	DI	Power-Down Input. When high, power downs the ADC. Power consumption is reduced and conversions are inhibited after the current one is completed.
35	$\overline{\text{CNVST}}$	DI	Conversion Start. A falling edge on $\overline{\text{CNVST}}$ puts the internal sample-and-hold into the hold state and initiates a conversion.
36	BIP	DI	Bipolar Input Range. Refer to Table 8. When MODE[1:0] = 0, 1, or 2, this input is used to select the bipolar input range. When MODE[1:0] = 3 (serial mode), and HW/ $\overline{\text{SW}}$ = high, driving BIP high selects the bipolar input range. HW/ $\overline{\text{SW}}$ = low, the input range is programmed with the serial programmable port and this pin is a don't care.
37	REF	AI/O	Reference Output/Input. When PDREF/PDBUF = low, the internal reference and buffer are enabled producing 5V on this pin. When PDREF/PDBUF = high, the internal reference and buffer are disabled allowing an externally supplied voltage reference up to AVDD volts. Decoupling is required with or without the internal reference and buffer.

Pin No.	Mnemonic	Type ¹	Description
38	REFGND	AI	Reference Input Analog Ground.
39	IN-	AI	Differential Negative Analog Input; referenced to IN+.
40	V _{CC}	P	High Voltage Positive Supply.
41	V _{EE}	P	High Voltage Negative Supply.
43	IN+	AI	Differential Positive Analog Input; referenced to IN-.
45	TEMP	AO	Temperature Sensor Analog Output.
46	REFBUFIN	AI/O	Reference Buffer Input. When using an external reference with the internal buffer (PDBUF = low, PDREF = high), applying 2.5V on this pin produces 5V on the REF pin.
47	PDREF	DI	When using the internal reference (PDBUF = PDREF = low), this pin should not be connected. Internal Reference Power-Down Input. When low, the internal reference is enabled (PDBUF also needs to be low).
48	PDBUF	DI	When high, the internal reference is powered down and an external reference must be used. Internal Reference Buffer Power-Down Input. When low, the buffer is enabled (PDREF also needs to be low). When high, the buffer is powered-down and an external reference must be used.

¹ AI = analog input; AI/O = bidirectional analog; AO = analog output; DI = digital input; DI/O = bidirectional digital; DO = digital output; P = power.

Table 8. Input Range Selection. Parallel Mode and Serial Hardware Mode

Range	BIP	TEN	HW/SW (serial mode)
0 - 5V	Low	Low	High
0 - 10V	Low	High	High
±5V	High	Low	High
±10V	High	High	High
All Ranges ¹	X	X	Low

¹ In serial mode (MODE[1:0] = 3) when HW/SW = low, the input ranges are defined by registers.

TERMINOLOGY

Integral Nonlinearity Error (INL)

Linearity error refers to the deviation of each individual code from a line drawn from negative full scale through positive full scale. The point used as negative full scale occurs $\frac{1}{2}$ LSB before the first code transition. Positive full scale is defined as a level $1\frac{1}{2}$ LSB beyond the last code transition. The deviation is measured from the middle of each code to the true straight line.

Differential Nonlinearity Error (DNL)

In an ideal ADC, code transitions are 1 LSB apart. Differential nonlinearity is the maximum deviation from this ideal value. It is often specified in terms of resolution for which no missing codes are guaranteed.

Gain Error

The first transition (from 000...00 to 000...01) should occur for an analog voltage $\frac{1}{2}$ LSB above the nominal negative full scale (19.073486 V for the 0 to 5V range). The last transition (from 111...10 to 111...11) should occur for an analog voltage $1\frac{1}{2}$ LSB below the nominal full scale (+4.999943 V for the 0 to 5V V range). The gain error is the deviation of the difference between the actual level of the last transition and the actual level of the first transition from the difference between the ideal levels.

Zero Error

The zero error is the difference between the ideal midscale input voltage (0 V) and the actual voltage producing the midscale output code.

Dynamic Range

It is the ratio of the rms value of the full scale to the rms noise measured with the inputs shorted together. The value for dynamic range is expressed in decibels.

Signal-to-Noise Ratio (SNR)

SNR is the ratio of the rms value of the actual input signal to the rms sum of all other spectral components below the Nyquist frequency, excluding harmonics and dc. The value for SNR is expressed in decibels.

Total Harmonic Distortion (THD)

THD is the ratio of the rms sum of the first five harmonic components to the rms value of a full-scale input signal and is expressed in decibels.

Signal to (Noise + Distortion) Ratio (SINAD)

SINAD is the ratio of the rms value of the actual input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

Spurious-Free Dynamic Range (SFDR)

The difference, in decibels (dB), between the rms amplitude of the input signal and the peak spurious signal.

Effective Number of Bits (ENOB)

ENOB is a measurement of the resolution with a sine wave input. It is related to SINAD and is expressed in bits by

$$ENOB = [(SINAD_{dB} - 1.76)/6.02]$$

Aperture Delay

Aperture delay is a measure of the acquisition performance and is measured from the falling edge of the CNVST input to when the input signal is held for a conversion.

Transient Response

The time required for the AD7641 to achieve its rated accuracy after a full-scale step function is applied to its input.

Reference Voltage Temperature Coefficient

It is derived from the typical shift of output voltage at 25°C on a sample of parts maximum and minimum reference output voltage (V_{REF}) measured at T_{MIN} , $T(25^\circ\text{C})$, and T_{MAX} . It is expressed in ppm/°C using

$$TCV_{REF} (\text{ppm}/^\circ\text{C}) = \frac{V_{REF}(\text{Max}) - V_{REF}(\text{Min})}{V_{REF}(25^\circ\text{C}) \times (T_{MAX} - T_{MIN})} \times 10^6$$

where:

$V_{REF}(\text{Max})$ = Maximum V_{REF} at T_{MIN} , $T(25^\circ\text{C})$, or T_{MAX}

$V_{REF}(\text{Min})$ = Minimum V_{REF} at T_{MIN} , $T(25^\circ\text{C})$, or T_{MAX}

$V_{REF}(25^\circ\text{C})$ = V_{REF} at 25°C

T_{MAX} = +85°C

T_{MIN} = -40°C
