

Dual, High Voltage Current Shunt Monitor

AD8213

FEATURES

- ±4000 V HBM ESD
- High common-mode voltage range
 - 2 V to +65 V operating
 - 3 V to +68 V survival
- Buffered output voltage
- Wide operating temperature range
 - 10-lead MSOP: -40°C to +125°C
- Excellent ac and dc performance
 - 3 $\mu\text{V}/^\circ\text{C}$ typical offset drift
 - 10 ppm/ $^\circ\text{C}$ typical gain drift
 - 120 dB typical CMRR at dc

APPLICATIONS

- High-side current sensing
 - Motor controls
 - Transmission controls
 - Diesel injection controls
 - Engine management
 - Suspension controls
 - Vehicle dynamic controls
 - DC-to-DC converters

GENERAL DESCRIPTION

The AD8213 is a dual-channel, precision current sense amplifier. It features a set gain of 20 V/V, with a maximum $\pm 0.5\%$ gain error over the entire temperature range. The buffered output voltage directly interfaces with any typical converter. Excellent common-mode rejection from -2 V to +65 V, is independent of the 5 V supply. The AD8213 performs unidirectional current measurements across a shunt resistor in a variety of industrial and automotive applications, such as motor control, solenoid control, or battery management.

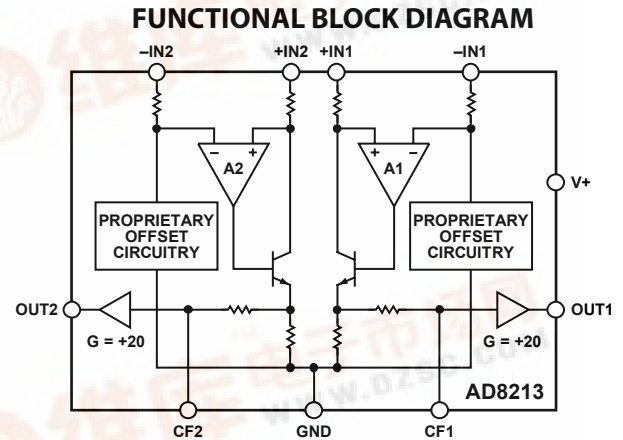

Figure 1.

Special circuitry is devoted to output linearity being maintained throughout the input differential voltage range of 0 mV to 250 mV, regardless of the common-mode voltage present. The AD8213 also features additional pins that allow the user to low-pass filter the input signal before amplifying, via an external capacitor to ground. The AD8213 has an operating temperature range of -40°C to +125°C and is offered in a small 10-lead MSOP package.

Spectral Density, 1 kHz, RTI		70		nV/ $\sqrt{\text{Hz}}$	
POWER SUPPLY					
Operating Range	4.5		5.5	V	$V_{CM} > 5\text{ V}$, per amplifier ¹ , total supply current for two channels
Quiescent Current Over Temperature		2.5	3.75	mA	
Power Supply Rejection Ratio	76			dB	
TEMPERATURE RANGE					
For Specified Performance	-40		+125	$^{\circ}\text{C}$	

¹ When the input common mode is less than 5 V, the supply current increases. This can be calculated by $I_S = -0.52(V_{CM}) + 4.9$ (see Figure 11).

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Supply Voltage	12.5 V
Continuous Input Voltage	-3 V to +68 V
Reverse Supply Voltage	-0.3 V
HBM (Human Body Model) ESD Rating	±4000 V
CDM (Charged Device Model) ESD Rating	±1000 V
Operating Temperature Range	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Output Short-Circuit Duration	Indefinite

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

AD8213

THEORY OF OPERATION

In typical applications, the AD8213 amplifies a small differential input voltage generated by the load current flowing through a shunt resistor. The AD8213 rejects high common-mode voltages (up to 65 V) and provides a ground referenced, buffered output that interfaces with an analog-to-digital converter (ADC). Figure 25 shows a simplified schematic of the AD8213.

The following explanation refers exclusively to Channel 1 of the AD8213, however, the same explanation applies to Channel 2.

A load current flowing through the external shunt resistor produces a voltage at the input terminals of the AD8213. The input terminals are connected to Amplifier A1 by Resistor R1(1) and Resistor R1(2). The inverting terminal, which has very high input impedance is held to $(V_{CM}) - (I_{SHUNT} \times R_{SHUNT})$, since negligible current flows through Resistor R1(2). Amplifier A1 forces the noninverting input to the same potential. Therefore, the current that flows through Resistor R1(1), is equal to

$$I_{IN1} = (I_{SHUNT1} \times R_{SHUNT1})/R1(1)$$

This current (I_{IN1}) is converted back to a voltage via R_{OUT1} . The output buffer amplifier has a gain of 20 V/V, and offers excellent accuracy as the internal gain setting resistors are precision trimmed to within 0.01% matching. The resulting output voltage is equal to

$$V_{OUT1} = (I_{SHUNT1} \times R_{SHUNT1}) \times 20$$

Prior to the buffer amplifier, a precision-trimmed 20 kΩ resistor is available to perform low-pass filtering of the input signal prior to the amplification stage. This means that the noise of the input signal is not amplified, but rejected, resulting in a more precise output signal that will directly interface with a converter. A capacitor from the CF1 pin to GND, will result in a low-pass filter with a corner frequency of

$$f_{-3dB} = \frac{1}{2\pi(20000)C_{FILTER}}$$

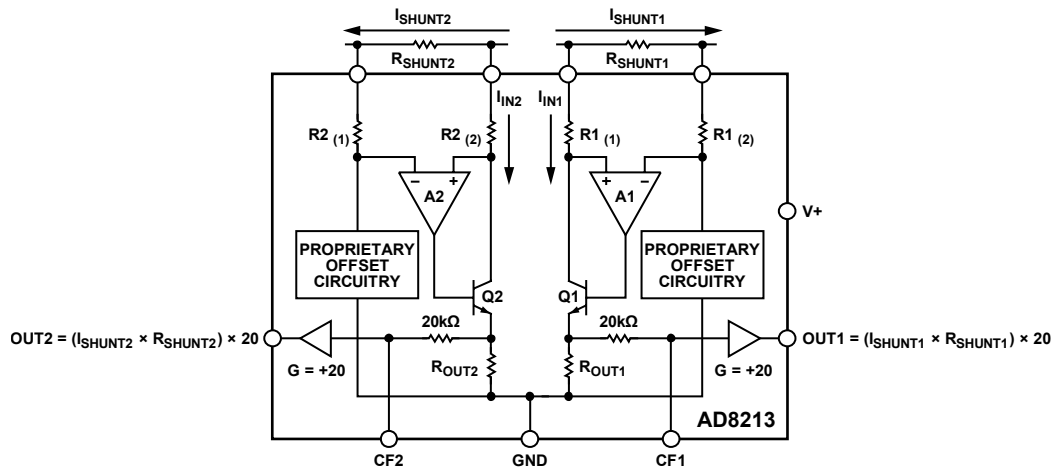

Figure 25. Simplified Schematic

APPLICATION NOTES

OUTPUT LINEARITY

In all current sensing applications, and especially in automotive and industrial environments where the common-mode voltage can vary significantly, it is important that the current sensor maintain the specified output linearity, regardless of the input differential or common-mode voltage. The AD8213 contains specific circuitry on the input stage, which ensures that even when the differential input voltage is very small, and the common-mode voltage is also low (below the 5 V supply), the input to output linearity is maintained. Figure 26 displays the input differential voltage versus the corresponding output voltage at different common modes.

Figure 26. Gain Linearity Due to Differential and Common-Mode Voltage

The AD8213 provides a correct output voltage, regardless of the common mode, when the input differential is at least 2 mV. This is due to the voltage range of the output amplifier that can go as low as 33 mV typical. The specified minimum output amplifier voltage is 100 mV in order to provide sufficient guardbands. The ability of the AD8213 to work with very small differential inputs regardless of the common-mode voltage, allows for more dynamic range, accuracy, and flexibility in any current sensing application.

LOW-PASS FILTERING

In typical applications, such as motor and solenoid current sensing, filtering the differential input signal of the AD8213 could be beneficial in reducing differential common-mode noise as well as transients and current ripples flowing through the input shunt resistor. Typically, such a filter can be implemented by adding a resistor in series with each input and a capacitor directly between the input pins. However, the AD8213 features a filter pin available after the input stage, but before the final amplification stage. The user can connect a capacitor to ground, making a low-pass filter with the internal precision-trimmed 20 kΩ resistor. This means the no gain or CMRR errors are introduced by adding resistors at the input of the AD8213. Figure 27 shows the typical connection.

Figure 27. Filter Capacitor Connections

The 3 dB frequency of this low-pass filter is calculated using the following formula:

$$f_{-3dB} = \frac{1}{2\pi(20000)C_{FILTER}}$$

It is recommended that in order to prevent output chatter due to noise potentially entering through the filter pin and coupling to the output, a capacitor is always placed from the filter pin to GND. This can be a ≈ 20 pF capacitor in cases when all of the bandwidth of the AD8213 is needed in the application.

AD8213

APPLICATIONS INFORMATION

HIGH-SIDE CURRENT SENSE WITH A LOW-SIDE SWITCH

In such load control configurations, the PWM controlled switch is ground referenced. An inductive load (solenoid) is tied to a power supply. A resistive shunt is placed between the switch and the load (see Figure 28). An advantage of placing the shunt on the high side is that the entire current, including the recirculation current, can be measured, because the shunt remains in the loop when the switch is off. In addition, diagnostics can be enhanced because shorts to ground can be detected with the shunt on the high side. In this circuit configuration, when the switch is closed, the common-mode voltage moves down to near the negative rail. When the switch is opened, the voltage reversal across the inductive load causes the common-mode voltage to be held one diode drop above the battery by the clamp diode.

Figure 28. Low-Side Switch

HIGH-SIDE CURRENT SENSING

In this configuration, the shunt resistor is referenced to the battery. High voltage will be present at the inputs of the current sense amplifier. In this mode, the recirculation current is again measured and shorts to ground can be detected. When the shunt is battery referenced the AD8213 produces a linear ground referenced analog output. An AD8214 can also be used to provide an overcurrent detection signal in as little as 100 ns. This feature will be useful in high current systems, where fast shutdown in overcurrent conditions is essential.

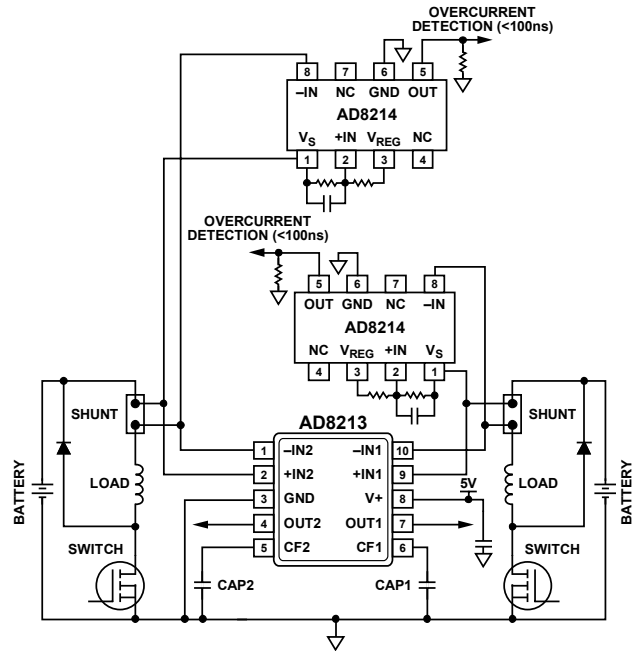

Figure 29. Battery Referenced Shunt Resistor

LOW-SIDE CURRENT SENSING

In systems where low-side current sensing is preferred, the AD8213 provides an integrated solution with great accuracy. Ground noise is rejected, CMRR is typical higher than 90 dB, and output linearity is not compromised, regardless of the input differential voltage.

Figure 30. Ground Referenced Shunt Resistor

BIDIRECTIONAL CURRENT SENSING

The AD8213 can also be configured to sense current in both directions at the inputs. This configuration is useful in charge/discharge applications. A typical connection diagram is shown in Figure 31. In this mode Channel 1 monitors I_{LOAD} and Channel 2 monitors I_{CHARGE} .

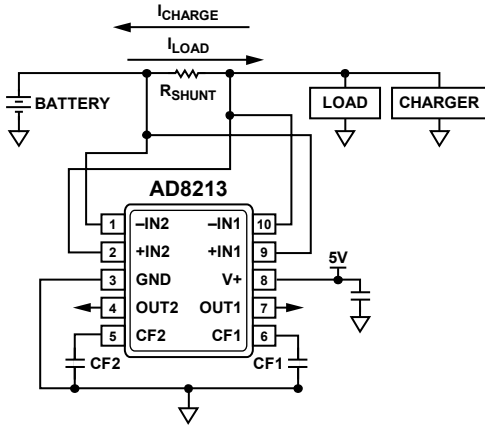

Figure 31. Bidirectional Current Sensing

For applications requiring a bidirectional current measurement, an optimal solution could be to use a single channel device, which offers the same functionality as the previous circuit. The [AD8210](#) is a single channel current sensor featuring bidirectional capability. The typical connection diagram for the AD8210 in bidirectional applications is shown in Figure 32.
