| <b>AKM</b>                            | <b>AK4343</b> |
| <b>Stereo DAC with HP/RCV/SPK-AMP</b> |               |

|                            |
|----------------------------|
| <b>GENERAL DESCRIPTION</b> |
|----------------------------|

The AK4343 is a stereo DAC with a built-in Headphone-Amplifier, Receiver-Amplifier and 1.2W output Speaker-Amplifier. The AK4343 features analog mixing circuits and PLL that allows easy interfacing in mobile phone and portable A/V player designs. The AK4343 is available in a 32pin QFN, utilizing less board space than competitive offerings.

|                 |
|-----------------|
| <b>FEATURES</b> |
|-----------------|

**1. Playback Function**

- Digital De-emphasis Filter (tc=50/15 $\mu$ s, fs=32kHz, 44.1kHz, 48kHz)
- Bass Boost
- Soft Mute
- Digital Volume (+12dB ~ -115.0dB, 0.5dB Step, Mute)
- Digital ALC (Automatic Level Control) (+36dB ~ -54dB, 0.375dB Step, Mute)
- Stereo Separation Emphasis
- Programmable EQ
- Stereo Line Output
  - Performance: S/(N+D): 88dB, S/N: 92dB
- Mono Receiver-Amp
  - BTL Output
  - Output Power: 30mW@32 $\Omega$  (AVDD=3.3V)
- Stereo Headphone-Amp
  - S/(N+D): 70dB@7.5mW, S/N: 90dB
  - Output Power: 70mW@16 $\Omega$  (HVDD=5V), 62mW@16 $\Omega$  (HVDD=3.3V)
  - Pop Noise Free at Power ON/OFF
- Mono Speaker-Amp
  - S/(N+D): 50dB@240mW, S/N: 90dB
  - BTL Output
  - Available for both Dynamic and Piezo Speaker
  - Output Power: 1.2W@8 $\Omega$  (HVDD=5V), 400mW@8 $\Omega$  (HVDD=3.3V) 3.0Vrms@50 $\Omega$  (HVDD=5V)
- Analog Mixing:
  - 3 Stereo Input
  - Gain Amplifier (+32dB/+26dB/+20dB or 0dB)

**2. Power Management**

**3. Master Clock:**

**(1) PLL Mode**

- Frequencies: 11.2896MHz, 12MHz, 12.288MHz, 13.5MHz, 24MHz, 27MHz (MCKI pin)
- 1fs (LRCK pin)
- 32fs or 64fs (BICK pin)

**(2) External Clock Mode**

- Frequencies: 256fs, 512fs or 1024fs (MCKI pin)

**4. Output Master Clock Frequencies: 32fs/64fs/128fs/256fs**

**5. Sampling Rate:**

- PLL Slave Mode (LRCK pin): 7.35kHz ~ 48kHz
- PLL Slave Mode (BICK pin): 7.35kHz ~ 48kHz
- PLL Slave Mode (MCKI pin): 8kHz, 11.025kHz, 12kHz, 16kHz, 22.05kHz, 24kHz, 32kHz, 44.1kHz, 48kHz
- PLL Master Mode: 8kHz, 11.025kHz, 12kHz, 16kHz, 22.05kHz, 24kHz, 32kHz, 44.1kHz, 48kHz

- EXT Master/Slave Mode:  
7.35kHz ~ 48kHz (256fs), 7.35kHz ~ 26kHz (512fs), 7.35kHz ~ 13kHz (1024fs)
- 6.  $\mu$ P I/F: 3-wire Serial, I<sup>2</sup>C Bus (Ver 1.0, 400kHz High Speed Mode)
- 7. Master/Slave mode
- 8. Audio Interface Format: MSB First, 2's complement
  - 16bit MSB justified, 16bit LSB justified, 16-24bit I<sup>2</sup>S, DSP Mode
- 9. Ta = -30 ~ 85°C (SPK-Amp=OFF)  
-30 ~ 70°C (SPK-Amp=ON)
- 10. Power Supply:
  - AVDD, DVDD: 2.6 ~ 3.6V (typ. 3.3V)
  - HVDD: 2.6 ~ 5.25V (typ. 3.3V/5.0V)
- 11. Package: 32pin QFN (5mm x 5mm, 0.5mm pitch)
- 12. Pin/Register Compatible with AK4642EN

|              | IN1+     | I   | Lch Positive Input 1 Pin (MDIF1 bit = "1": Full-differential Input)   |

Note 1. All input pins except analog input pins (MIN/LIN3, LIN1, RIN1, LIN2, RIN2, RIN3) should not be left floating.

Note 2. AVDD or AVSS voltage should be input to I2C pin.

### ■ Handling of Unused Pin

The unused I/O pins should be processed appropriately as below.

| Classification | Pin Name  | Setting                               |
|----------------|---|---------------------------------------|
| Analog         | VCOC/RIN3, SPN, SPP, HPR, HPL, MUTET, ROUT/RCN, LOU/RCP, MIN/LIN3, RIN2/IN2-, LIN2/IN2+, LIN1/IN1-, RIN1/IN1+ | These pins should be open.            |
| Digital        | MCKO  | This pin should be open.              |
|                | MCKI  | This pin should be connected to DVSS. |

### ABSOLUTE MAXIMUM RATINGS

| Maximum Power Dissipation (Note 7)     | Ta=85°C (Note 8)            | Pd1           | -        | 750   | mW |
|  | Ta=70°C (Note 9)            | Pd2           | -        | 1000  | mW |

Note 3. All voltages with respect to ground.

Note 4. AVSS, DVSS and HVSS must be connected to the same analog ground plane.

Note 5. I2C, MIN/LIN3, RIN3, RIN2/IN2-, LIN2/IN2+, LIN1/IN1-, RIN1/IN1+ pins

Note 6. PDN, CSN/CAD0, CCLK/SCL, CDTI/SDA, SDTI, LRCK, BICK, MCKI pins

Pull-up resistors at SDA and SCL pins should be connected to (DVDD+0.3)V or less voltage.

Note 7. In case that the exposed pad is connected to the ground and PCB wiring density is 100%. If the exposed pad is open, Pd1=400mW(max: Speaker-Amp is not available.) and Pd2=550mW(max: Speaker-Amp is available at HVDD=2.6~3.6V.). This power is the AK4343 internal dissipation that does not include power of externally connected speaker and headphone.

Note 8. Speaker-Amp is available at HVDD=2.6~3.6V.

Note 9. Speaker-Amp is available at HVDD=2.6~5.25V.

WARNING: Operation at or beyond these limits may result in permanent damage to the device.

Normal operation is not guaranteed at these extremes.

|   |

| <b>RECOMMENDED OPERATING CONDITIONS</b> |
|---|

(AVSS, DVSS, HVSS=0V; Note 3)

| Parameter                   |              | Symbol    | min  | typ       | max  | Units |
|-----------------------------|--------------|-----------|------|-----------|------|-------|
| Power Supplies<br>(Note 10) | Analog       | AVDD      | 2.6  | 3.3       | 3.6  | V     |
|                             | Digital      | DVDD      | 2.6  | 3.3       | 3.6  | V     |
|                             | HP / SPK-Amp | HVDD      | 2.6  | 3.3 / 5.0 | 5.25 | V     |
|                             | Difference   | AVDD-DVDD | -0.3 | 0         | +0.3 | V     |

Note 3. All voltages with respect to ground.

Note 10. The power-up sequence between AVDD, DVDD and HVDD is not critical. When only AVDD or HVDD is powered OFF, the power supply current of DVDD at power-down mode may be increased. DVDD should not be powered OFF while AVDD or HVDD is powered ON.

\* AKM assumes no responsibility for the usage beyond the conditions in this datasheet.

|  | MGAIN1-0 bits = "01"               | -   | +20 | -     | dB    |
|  | MGAIN1-0 bits = "10"               | -   | +26 | -     | dB    |
|  | MGAIN1-0 bits = "11"               | -   | +32 | -     | dB    |
| <b>Gain Amplifier:</b> IN1+/IN1-/IN2+/IN2- pins; MDIF1 = MDIF2 bits = "1" (Full-differential input)                                |                                    |     |     |       |       |
| Maximum Input Voltage (Note 11)  |                                    |     |     |       |       |
|  | MGAIN1-0 bits = "01"               | -   | -   | 0.228 | Vpp   |
|  | MGAIN1-0 bits = "10"               | -   | -   | 0.114 | Vpp   |
|  | MGAIN1-0 bits = "11"               | -   | -   | 0.057 | Vpp   |

Note 11. The voltage difference between IN1/2+ and IN1/2- pins. AC coupling capacitor should be inserted in series at each input pin. Full-differential mic input is not available at MGAIN1-0 bits = "00". Maximum input voltage of IN1+, IN1-, IN2+ and IN2- pins is proportional to AVDD voltage, respectively.

$$V_{in} = 0.069 \times AVDD \text{ (max)@MGAIN1-0 bits = "01"}, 0.035 \times AVDD \text{ (max)@MGAIN1-0 bits = "10"}, 0.017 \times AVDD \text{ (max)@MGAIN1-0 bits = "11"}$$

When the signal larger than above value is input to IN1+, IN1-, IN2+ or IN2- pin, Gain Amp does not operate normally.

|   | ALC bit = "1", SPKG1-0 bits = "00"                       | -         | +6.43        | -                | dB                                 |
|   | ALC bit = "1", SPKG1-0 bits = "01"                       | -         | +8.43        | -                | dB                                 |
|   | ALC bit = "1", SPKG1-0 bits = "10"                       | -         | +12.65       | -                | dB                                 |
|   | ALC bit = "1", SPKG1-0 bits = "11"                       | -         | +14.65       | -                | dB                                 |

Note 17. Output voltage is proportional to AVDD voltage.

$V_{out} = 0.94 \times AVDD(\text{typ}) @ \text{SPKG1-0 bits} = "00"$ ,  $1.19 \times AVDD(\text{typ}) @ \text{SPKG1-0 bits} = "01"$ ,  $2.05 \times AVDD(\text{typ}) @ \text{SPKG1-0 bits} = "10"$ ,  $2.58 \times AVDD(\text{typ}) @ \text{SPKG1-0 bits} = "11"$  at Full-differential output.

Note 18. In case of measuring at SPP and SPN pins.

Note 19. Load impedance is total impedance of series resistance (R<sub>series</sub>) and piezo speaker impedance at 1kHz in Figure 58. Load capacitance is capacitance of piezo speaker. When piezo speaker is used, 10Ω or more series resistors should be connected at both SPP and SPN pins, respectively.

Note 20. Maximum voltage is in proportion to both AVDD and external input resistance (R<sub>in</sub>).  $V_{in} = 0.6 \times AVDD \times R_{in} / 20k\Omega$  (typ).

Note 21. The gain is in inverse proportion to external input resistance.

Table 1. Power Consumption for each operation mode (typ)

### FILTER CHARACTERISTICS

(Ta=25°C; AVDD, DVDD=2.6 ~ 3.6V; HVDD=2.6 ~ 5.25V; fs=44.1kHz; DEM=OFF; FIL1=FIL3=EQ=OFF)

| Parameter                              | Symbol | min   | typ  | max   | Units |     |
|--|--------|-------|------|-------|-------|-----|
| <b>DAC Digital Filter (LPF):</b>       |        |       |      |       |       |     |
| Passband (Note 27)                     | ±0.1dB | PB    | 0    | -     | 19.6  | kHz |
|  | -0.7dB |       | -    | 20.0  | -     | kHz |
|  | -6.0dB |       | -    | 22.05 | -     | kHz |
| Stopband                               | SB     | 25.2  | -    | -     | kHz   |     |
| Passband Ripple                        | PR     | -     | -    | ±0.01 | dB    |     |
| Stopband Attenuation                   | SA     | 59    | -    | -     | dB    |     |
| Group Delay (Note 28)                  | GD     | -     | 25   | -     | 1/fs  |     |
| <b>DAC Digital Filter (LPF) + SCF:</b> |        |       |      |       |       |     |
| Frequency Response: 0 ~ 20.0kHz        | FR     | -     | ±1.0 | -     | dB    |     |
| <b>DAC Digital Filter (HPF):</b>       |        |       |      |       |       |     |
| Frequency Response (Note 27)           | -3.0dB | FR    | -    | 0.9   | -     | Hz  |
|  | -0.5dB |       | -    | 2.7   | -     | Hz  |
|  | -0.1dB |       | -    | 6.0   | -     | Hz  |
| <b>BOOST Filter: (Note 29)</b>         |        |       |      |       |       |     |
| Frequency Response                     | MIN    | 20Hz  | FR   | -     | 5.76  | dB  |
|  |        | 100Hz |      | -     | 2.92  | dB  |
|  |        | 1kHz  |      | -     | 0.02  | dB  |
|  | MID    | 20Hz  | FR   | -     | 10.80 | dB  |
|  |        | 100Hz |      | -     | 6.84  | dB  |
|  |        | 1kHz  |      | -     | 0.13  | dB  |
|  | MAX    | 20Hz  | FR   | -     | 16.06 | dB  |
|  |        | 100Hz |      | -     | 10.54 | dB  |
|  |        | 1kHz  |      | -     | 0.37  | dB  |

Note 27. The passband and stopband frequencies scale with fs (system sampling rate).

For example, PB=0.454\*fs (@-0.7dB). Each response refers to that of 1kHz.

Note 28. The calculated delay time caused by digital filtering. This time is from setting the 16-bit data of both channels from the input register to the output of analog signal.

Note 29. These frequency responses scale with fs. If a high-level and low frequency signal is input, the analog output clips to the full-scale.

**DC CHARACTERISTICS**

|---------------------------|
| <b>OPERATION OVERVIEW</b> |
|---------------------------|

### ■ System Clock

There are the following four clock modes to interface with external devices (see Table 2 and Table 3).

| Mode  | PMPLL bit | M/S bit | PLL3-0 bits | Figure                 |
|---|-----------|---------|-------------|------------------------|
| PLL Master Mode (Note 37)                                   | 1         | 1       | See Table 5 | Figure 18              |
| PLL Slave Mode 1<br>(PLL Reference Clock: MCKI pin)         | 1         | 0       | See Table 5 | Figure 19              |
| PLL Slave Mode 2<br>(PLL Reference Clock: LRCK or BICK pin) | 1         | 0       | See Table 5 | Figure 20<br>Figure 21 |
| EXT Slave Mode  | 0         | 0       | x           | Figure 22              |
| EXT Master Mode   | 0         | 1       | x           | Figure 23              |

Note 37. If M/S bit = "1", PMPLL bit = "0" and MCKO bit = "1" during the setting of PLL Master Mode, the invalid clocks are output from MCKO pin when MCKO bit is "1".

Table 2. Clock Mode Setting (x: Don't care)

| Mode  | MCKO bit | MCKO pin                  | MCKI pin                   | BICK pin                              | LRCK pin        |
|---|----------|---------------------------|----------------------------|---------------------------------------|-----------------|
| PLL Master Mode   | 0        | "L"                       | Selected by<br>PLL3-0 bits | Output<br>(Selected by<br>BCKO bit)   | Output<br>(1fs) |
|   | 1        | Selected by<br>PS1-0 bits |                            |                                       |                 |
| PLL Slave Mode<br>(PLL Reference Clock: MCKI pin)         | 0        | "L"                       | Selected by<br>PLL3-0 bits | Input<br>(≥ 32fs)                     | Input<br>(1fs)  |
|   | 1        | Selected by<br>PS1-0 bits |                            |                                       |                 |
| PLL Slave Mode<br>(PLL Reference Clock: LRCK or BICK pin) | 0        | "L"                       | GND                        | Input<br>(Selected by<br>PLL3-0 bits) | Input<br>(1fs)  |
| EXT Slave Mode  | 0        | "L"                       | Selected by<br>FS1-0 bits  | Input<br>(≥ 32fs)                     | Input<br>(1fs)  |
| EXT Master Mode   | 0        | "L"                       | Selected by<br>FS1-0 bits  | Output<br>(Selected by<br>BCKO bit)   | Output<br>(1fs) |

Table 3. Clock pins state in Clock Mode

### ■ Master Mode/Slave Mode

The M/S bit selects either master or slave mode. M/S bit = "1" selects master mode and "0" selects slave mode. When the AK4343 is power-down mode (PDN pin = "L") and exits reset state, the AK4343 is slave mode. After exiting reset state, the AK4343 goes to master mode by changing M/S bit = "1".

When the AK4343 is used by master mode, LRCK and BICK pins are a floating state until M/S bit becomes "1". LRCK and BICK pins of the AK4343 should be pulled-down or pulled-up by the resistor (about 100kΩ) externally to avoid the floating state.

| M/S bit | Mode        |
|---------|-------------|
| 0       | Slave Mode  |
| 1       | Master Mode |

Default

Table 4. Select Master/Slave Mode

### ■ PLL Mode (AIN3 bit = “0”, PMPLL bit = “1”)

When PMPLL bit is “1”, a fully integrated analog phase locked loop (PLL) generates a clock that is selected by the PLL3-0 and FS3-0 bits. The PLL lock time is shown in Table 5, whenever the AK4343 is supplied to a stable clocks after PLL is powered-up (PMPLL bit = “0” → “1”) or sampling frequency changes. When AIN3 bit = “1”, the PLL is not available.

#### 1) Setting of PLL Mode

| Mode   | PLL3 bit | PLL2 bit | PLL1 bit | PLL0 bit | PLL Reference Clock Input Pin | Input Frequency | R and C of VCOC pin |      | PLL Lock Time (max) |         |
|--------|----------|----------|----------|----------|-------------------------------|-----------------|---------------------|------|---------------------|---------|
|        |          |          |          |          |                               |                 | R[Ω]                | C[F] |                     |         |
| 0      | 0        | 0        | 0        | 0        | LRCK pin                      | 1fs             | 6.8k                | 220n | 160ms               | Default |
| 1      | 0        | 0        | 0        | 1        | N/A                           | -               | -                   | -    | -                   |         |
| 2      | 0        | 0        | 1        | 0        | BICK pin                      | 32fs            | 10k                 | 4.7n | 2ms                 |         |
|        |          |          |          |          |                               |                 | 10k                 | 10n  | 4ms                 |         |
| 3      | 0        | 0        | 1        | 1        | BICK pin                      | 64fs            | 10k                 | 4.7n | 2ms                 |         |
|        |          |          |          |          |                               |                 | 10k                 | 10n  | 4ms                 |         |
| 4      | 0        | 1        | 0        | 0        | MCKI pin                      | 11.2896MHz      | 10k                 | 4.7n | 40ms                |         |
| 5      | 0        | 1        | 0        | 1        | MCKI pin                      | 12.288MHz       | 10k                 | 4.7n | 40ms                |         |
| 6      | 0        | 1        | 1        | 0        | MCKI pin                      | 12MHz           | 10k                 | 4.7n | 40ms                |         |
| 7      | 0        | 1        | 1        | 1        | MCKI pin                      | 24MHz           | 10k                 | 4.7n | 40ms                |         |
| 12     | 1        | 1        | 0        | 0        | MCKI pin                      | 13.5MHz         | 10k                 | 10n  | 40ms                |         |
| 13     | 1        | 1        | 0        | 1        | MCKI pin                      | 27MHz           | 10k                 | 10n  | 40ms                |         |
| Others | Others   |          |          | N/A      |                               |                 |                     |      |                     |         |

Table 5. Setting of PLL Mode (\*fs: Sampling Frequency)

#### 2) Setting of sampling frequency in PLL Mode

When PLL reference clock input is MCKI pin, the sampling frequency is selected by FS3-0 bits as defined in Table 6.

| Mode   | FS3 bit | FS2 bit | FS1 bit | FS0 bit | Sampling Frequency |         |
|--------|---------|---------|---------|---------|--------------------|---------|
| 0      | 0       | 0       | 0       | 0       | 8kHz               | Default |
| 1      | 0       | 0       | 0       | 1       | 12kHz              |         |
| 2      | 0       | 0       | 1       | 0       | 16kHz              |         |
| 3      | 0       | 0       | 1       | 1       | 24kHz              |         |
| 4      | 0       | 1       | 0       | 0       | 7.35kHz            |         |
| 5      | 0       | 1       | 0       | 1       | 11.025kHz          |         |
| 6      | 0       | 1       | 1       | 0       | 14.7kHz            |         |
| 7      | 0       | 1       | 1       | 1       | 22.05kHz           |         |
| 10     | 1       | 0       | 1       | 0       | 32kHz              |         |
| 11     | 1       | 0       | 1       | 1       | 48kHz              |         |
| 14     | 1       | 1       | 1       | 0       | 29.4kHz            |         |
| 15     | 1       | 1       | 1       | 1       | 44.1kHz            |         |
| Others | Others  |         |         | N/A     |                    |         |

Table 6. Setting of Sampling Frequency at PMPLL bit = “1” (Reference Clock = MCKI pin)

When PLL reference clock input is LRCK or BICK pin, the sampling frequency is selected by FS3 and FS1-0 bits. (See Table 7). **FS2 bit is “don’t care”.**

| Mode   | FS3 bit | FS2 bit    | FS1 bit | FS0 bit | Sampling Frequency Range |         |
|--------|---------|------------|---------|---------|--------------------------|---------|
| 0      | 0       | Don’t care | 0       | 0       | 7.35kHz ≤ fs ≤ 8kHz      | Default |
| 1      | 0       | Don’t care | 0       | 1       | 8kHz < fs ≤ 12kHz        |         |
| 2      | 0       | Don’t care | 1       | 0       | 12kHz < fs ≤ 16kHz       |         |
| 3      | 0       | Don’t care | 1       | 1       | 16kHz < fs ≤ 24kHz       |         |

Table 7. Setting of Sampling Frequency at PMPLL bit = “1” (Reference Clock = LRCK or BICK pin)

## ■ PLL Unlock State

1) PLL Master Mode (AIN3 bit = “0”; PMPLL bit = “1”, M/S bit = “1”)

In this mode, LRCK and BICK pins go to “L” and irregular frequency clock is output from MCKO pins at MCKO bit is “1” before the PLL goes to lock state after PMPLL bit = “0” → “1”. If MCKO bit is “0”, MCKO pin goes to “L” (see Table 8).

After the PLL is locked, a first period of LRCK and BICK may be invalid clock, but these clocks return to normal state after a period of 1/fs.

When sampling frequency is changed, BICK and LRCK pins do not output irregular frequency clocks but go to “L” by setting PMPLL bit to “0”.

| PLL State                      | MCKO pin       |                | BICK pin     | LRCK pin   |
|--------------------------------|----------------|----------------|--------------|------------|
|                                | MCKO bit = “0” | MCKO bit = “1” |              |            |
| After that PMPLL bit “0” → “1” | “L” Output     | Invalid        | “L” Output   | “L” Output |
| PLL Unlock (except above case) | “L” Output     | Invalid        | Invalid      | Invalid    |
| PLL Lock                       | “L” Output     | See Table 10   | See Table 11 | 1fs Output |

Table 8. Clock Operation at PLL Master Mode (PMPLL bit = “1”, M/S bit = “1”)

2) PLL Slave Mode (AIN3 bit = “0”, PMPLL bit = “1”, M/S bit = “0”)

In this mode, an invalid clock is output from MCKO pin before the PLL goes to lock state after PMPLL bit = “0” → “1”. After that, the clock selected by Table 10 is output from MCKO pin when PLL is locked. DAC output invalid data when the PLL is unlocked. The output signal should be muted by writing “0” to DACL, DACH and DACS bits.

| PLL State                      | MCKO pin       |                |
|--------------------------------|----------------|----------------|
|                                | MCKO bit = “0” | MCKO bit = “1” |
| After that PMPLL bit “0” → “1” | “L” Output     | Invalid        |
| PLL Unlock                     | “L” Output     | Invalid        |
| PLL Lock                       | “L” Output     | Output         |

Table 9. Clock Operation at PLL Slave Mode (PMPLL bit = “0”, M/S bit = “0”)

■ PLL Master Mode (AIN3 bit = “0”, PMPLL bit = “1”, M/S bit = “1”)

When an external clock (11.2896MHz, 12MHz, 12.288MHz, 13.5MHz, 24MHz or 27MHz) is input to MCKI pin, the MCKO, BICK and LRCK clocks are generated by an internal PLL circuit. The MCKO output frequency is selected by PS1-0 bits (see Table 10) and the output is enabled by MCKO bit. The BICK output frequency is selected between 32fs or 64fs, by BCKO bit (see Table 11).

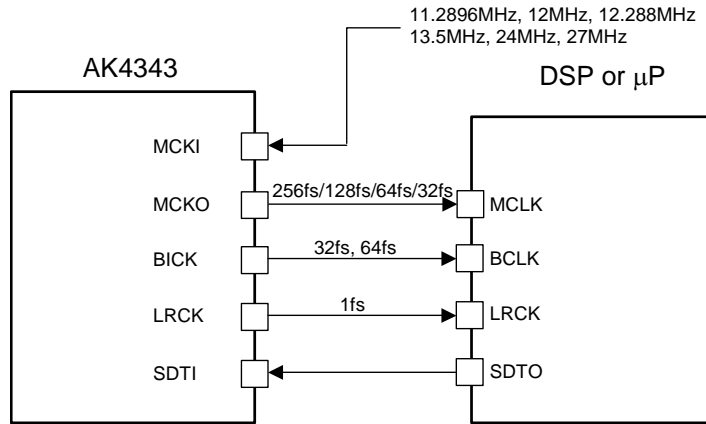

Figure 18. PLL Master Mode

| Mode | PS1 bit | PS0 bit | MCKO pin |
|------|---------|---------|----------|
| 0    | 0       | 0       | 256fs    |
| 1    | 0       | 1       | 128fs    |
| 2    | 1       | 0       | 64fs     |
| 3    | 1       | 1       | 32fs     |

Default

Table 10. MCKO Output Frequency (PLL Mode, MCKO bit = “1”)

| BCKO bit | BICK Output Frequency |
|----------|-----------------------|
| 0        | 32fs                  |
| 1        | 64fs                  |

Default

Table 11. BICK Output Frequency at Master Mode

■ **PLL Slave Mode (AIN3 bit = “0”, PMPLL bit = “1”, M/S bit = “0”)**

A reference clock of PLL is selected among the input clocks to MCKI, BICK or LRCK pin. The required clock to the AK4343 is generated by an internal PLL circuit. Input frequency is selected by PLL3-0 bits (see Table 5).

**a) PLL reference clock: MCKI pin**

BICK and LRCK inputs should be synchronized with MCKO output. The phase between MCKO and LRCK dose not matter. MCKO pin outputs the frequency selected by PS1-0 bits (see Table 10) and the output is enabled by MCKO bit. Sampling frequency can be selected by FS3-0 bits (see Table 6).

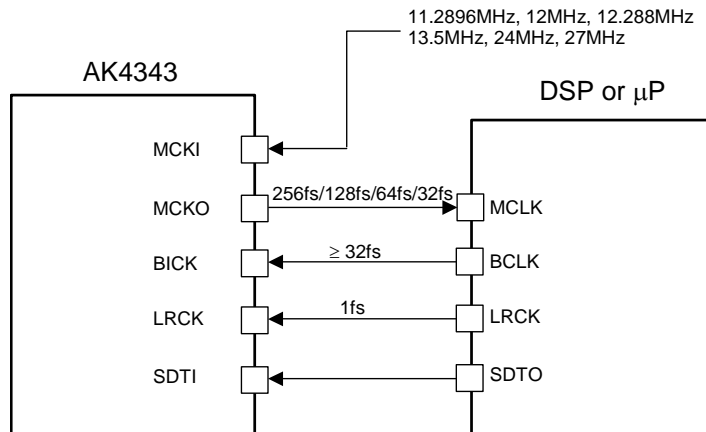

Figure 19. PLL Slave Mode 1 (PLL Reference Clock: MCKI pin)

**b) PLL reference clock: BICK or LRCK pin**

Sampling frequency corresponds to 7.35kHz to 48kHz by changing FS3-0 bits (see Table 7).

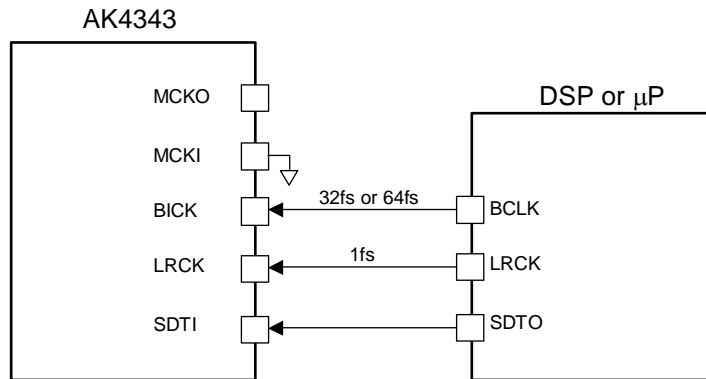

Figure 20. PLL Slave Mode 2 (PLL Reference Clock: BICK pin)

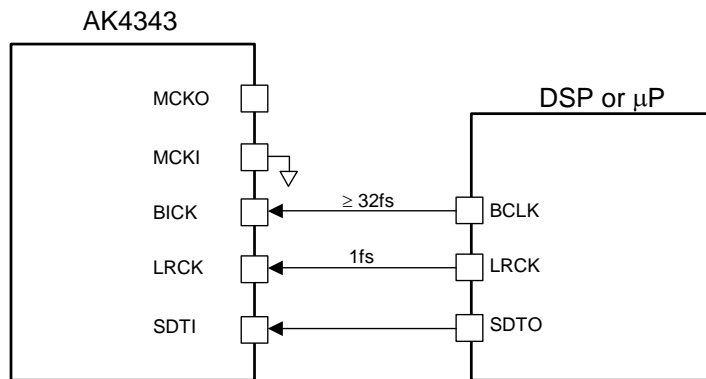

Figure 21. PLL Slave Mode 2 (PLL Reference Clock: LRCK pin)

The external clocks (MCKI, BICK and LRCK) should always be present whenever the DAC is in operation (PMDAC bit = “1”). If these clocks are not provided, the AK4343 may draw excess current and it is not possible to operate properly because utilizes dynamic refreshed logic internally. If the external clocks are not present, the DAC should be in the power-down mode (PMDAC bit = “0”).

■ EXT Slave Mode (PMPLL bit = “0”, M/S bit = “0”)

When PMPLL bit is “0”, the AK4343 becomes EXT mode. Master clock is input from MCKI pin, the internal PLL circuit is not operated. This mode is compatible with I/F of the normal audio DAC. The clocks required to operate are MCKI (256fs, 512fs or 1024fs), LRCK (fs) and BICK ( $\geq 32fs$ ). The master clock (MCKI) should be synchronized with LRCK. The phase between these clocks does not matter. The input frequency of MCKI is selected by FS1-0 bits (see Table 12).

| Mode | FS3-2 bits | FS1 bit | FS0 bit | MCKI Input Frequency | Sampling Frequency Range |         |
|------|------------|---------|---------|----------------------|--------------------------|---------|
| 0    | Don't care | 0       | 0       | 256fs                | 7.35kHz ~ 48kHz          | Default |
| 1    | Don't care | 0       | 1       | 1024fs               | 7.35kHz ~ 13kHz          |         |
| 2    | Don't care | 1       | 0       | 256fs                | 7.35kHz ~ 48kHz          |         |
| 3    | Don't care | 1       | 1       | 512fs                | 7.35kHz ~ 26kHz          |         |

Table 12. MCKI Frequency at EXT Slave Mode (PMPLL bit = “0”, M/S bit = “0”)

The S/N of the DAC at low sampling frequencies is worse than at high sampling frequencies due to out-of-band noise. The out-of-band noise can be improved by using higher frequency of the master clock. The S/N of the DAC output through LOUT/ROUT pins at fs=8kHz is shown in Table 13.

| MCKI   | S/N<br>(fs=8kHz, 20kHzLPF + A-weighted) |
|--------|---|
| 256fs  | 83dB                                    |
| 512fs  | 93dB                                    |
| 1024fs | 93dB                                    |

Table 13. Relationship between MCKI and S/N of LOUT/ROUT pins

The external clocks (MCKI, BICK and LRCK) should always be present whenever the DAC is in operation (PMDAC bit = “1”). If these clocks are not provided, the AK4343 may draw excess current and it is not possible to operate properly because utilizes dynamic refreshed logic internally. If the external clocks are not present, the DAC should be in the power-down mode (PMDAC bit = “0”).

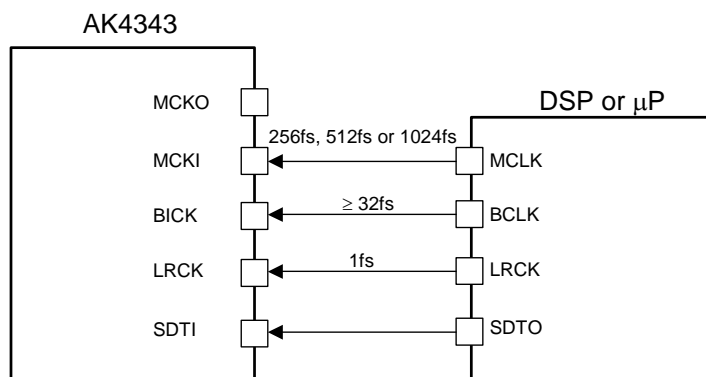

Figure 22. EXT Slave Mode

■ EXT Master Mode (PMPLL bit = “0”, M/S bit = “1”)

The AK4343 becomes EXT Master Mode by setting PMPLL bit = “0” and M/S bit = “1”. Master clock is input from MCKI pin, the internal PLL circuit is not operated. The clock required to operate is MCKI (256fs, 512fs or 1024fs). The input frequency of MCKI is selected by FS1-0 bits (see Table 14).

| Mode | FS3-2 bits | FS1 bit | FS0 bit | MCKI Input Frequency | Sampling Frequency Range |         |
|------|------------|---------|---------|----------------------|--------------------------|---------|
| 0    | Don't care | 0       | 0       | 256fs                | 7.35kHz ~ 48kHz          | Default |
| 1    | Don't care | 0       | 1       | 1024fs               | 7.35kHz ~ 13kHz          |         |
| 2    | Don't care | 1       | 0       | 256fs                | 7.35kHz ~ 48kHz          |         |
| 3    | Don't care | 1       | 1       | 512fs                | 7.35kHz ~ 26kHz          |         |

Table 14. MCKI Frequency at EXT Master Mode (PMPLL bit = “0”, M/S bit = “1”)

The S/N of the DAC at low sampling frequencies is worse than at high sampling frequencies due to out-of-band noise. The out-of-band noise can be improved by using higher frequency of the master clock. The S/N of the DAC output through LOUT/ROUT pins at fs=8kHz is shown in Table 15.

| MCKI   | S/N<br>(fs=8kHz, 20kHzLPF + A-weighted) |
|--------|---|
| 256fs  | 83dB                                    |
| 512fs  | 93dB                                    |
| 1024fs | 93dB                                    |

Table 15. Relationship between MCKI and S/N of LOUT/ROUT pins

MCKI should always be present whenever the DAC is in operation (PMDAC bit = “1”). If MCKI is not provided, the AK4343 may draw excess current and it is not possible to operate properly because utilizes dynamic refreshed logic internally. If MCKI is not present, the DAC should be in the power-down mode (PMDAC bit = “0”).

Figure 23. EXT Master Mode

| BCKO bit | BICK Output Frequency |         |
|----------|-----------------------|---------|
| 0        | 32fs                  | Default |
| 1        | 64fs                  |         |

Table 16. BICK Output Frequency at Master Mode

## ■ System Reset

Upon power-up, the AK4343 should be reset by bringing the PDN pin = "L". This ensures that all internal registers reset to their initial values.

The DAC enters an initialization cycle that starts when the PMDAC bit is changed from "0" to "1". The initialization cycle time is  $1059/f_s=24\text{ms}@f_s=44.1\text{kHz}$ . During the initialization cycle, the DAC input digital data of both channels are internally forced to a 2's complement, "0". The DAC output reflects the digital input data after the initialization cycle is complete.

## ■ Audio Interface Format

Four types of data formats are available and are selected by setting the DIF1-0 bits (see Table 17). In all modes, the serial data is MSB first, 2's complement format. Audio interface formats can be used in both master and slave modes. LRCK and BICK are output from the AK4343 in master mode, but must be input to the AK4343 in slave mode.

| Mode | DIF1 bit | DIF0 bit | SDTI (DAC)                  | BICK         | Figure    |
|------|----------|----------|-----------------------------|--------------|-----------|
| 0    | 0        | 0        | DSP Mode                    | $\geq 32f_s$ | Table 18  |
| 1    | 0        | 1        | LSB justified               | $\geq 32f_s$ | Figure 28 |
| 2    | 1        | 0        | MSB justified               | $\geq 32f_s$ | Figure 29 |
| 3    | 1        | 1        | I <sup>2</sup> S compatible | $\geq 32f_s$ | Figure 30 |

Default

Table 17. Audio Interface Format

In modes 1, 2 and 3, the SDTI is latched on the rising edge ("↑") of BICK.

In Modes 0 (DSP mode), the audio I/F timing is changed by BCKP and MSBS bits (Table 18).

| DIF1 | DIF0 | MSBS | BCKP | Audio Interface Format   | Figure    |
|------|------|------|------|--|-----------|
| 0    | 0    | 0    | 0    | MSB of SDTI is latched by the falling edge ("↓") of the BICK just after the rising edge ("↑") of the first BICK after the rising edge ("↑") of LRCK. | Figure 24 |
|      |      | 0    | 1    | MSB of SDTI is latched by the rising edge ("↑") of the BICK just after the falling edge ("↓") of the first BICK after the rising edge ("↑") of LRCK. | Figure 25 |
|      |      | 1    | 0    | MSB of SDTI is latched by the 2nd falling edge ("↓") of the BICK after the rising edge ("↑") of LRCK.  | Figure 26 |
|      |      | 1    | 1    | MSB of SDTI is latched by the 2nd rising edge ("↑") of the BICK after the rising edge ("↑") of LRCK..  | Figure 27 |

■ Digital High Pass Filter

The AK4343 has a digital high pass filter for DC offset cancellation. The cut-off frequency of the HPF is 0.9Hz (@fs=44.1kHz) and scales with sampling rate (fs).

■ Input Selector

The AK4343 has input selector. When MDIF1 and MDIF2 bits are “0”, INL1-0 and INR1-0 bits select LIN1/LIN2/LIN3 and RIN1/RIN2/RIN3, respectively. When MDIF1 and MDIF2 bits are “1”, LIN1, RIN1, LIN2 and RIN2 pins become IN1-, IN1+, IN2+ and IN2- pins respectively. In this case, full-differential input is available. When full-differential input is used, the signal should not be input to the pins marked by “X” in Table 20.

| MDIF1 bit | MDIF2 bit | INL1 bit | INL0 bit | INR1 bit | INR0 bit | Lch    | Rch    |         |
|-----------|-----------|----------|----------|----------|----------|--------|--------|---------|
| 0         | 0         | 0        | 0        | 0        | 0        | LIN1   | RIN1   | Default |
| 0         | 0         | 0        | 0        | 0        | 1        | LIN1   | RIN2   |         |
| 0         | 0         | 0        | 0        | 1        | 0        | LIN1   | RIN3   |         |
| 0         | 0         | 0        | 1        | 0        | 0        | LIN2   | RIN1   |         |
| 0         | 0         | 0        | 1        | 0        | 1        | LIN2   | RIN2   |         |
| 0         | 0         | 0        | 1        | 1        | 0        | LIN2   | RIN3   |         |
| 0         | 0         | 1        | 0        | 0        | 0        | LIN3   | RIN1   |         |
| 0         | 0         | 1        | 0        | 0        | 1        | LIN3   | RIN2   |         |
| 0         | 0         | 1        | 0        | 1        | 0        | LIN3   | RIN3   |         |
| 0         | 1         | 0        | 0        | 0        | 0        | LIN1   | IN2+/- |         |
| 0         | 1         | 1        | 0        | 0        | 0        | LIN3   | IN2+/- |         |
| 1         | 0         | 0        | 0        | 0        | 1        | IN1+/- | RIN2   |         |
| 1         | 0         | 0        | 0        | 1        | 0        | IN1+/- | RIN3   |         |
| 1         | 1         | 0        | 0        | 0        | 0        | IN1+/- | IN2+/- |         |
| Others    |           |          |          |          |          | N/A    | N/A    |         |

Table 20. Handling of Line Input Pins (“-”: N/A; “X”: Signal should not be input.)

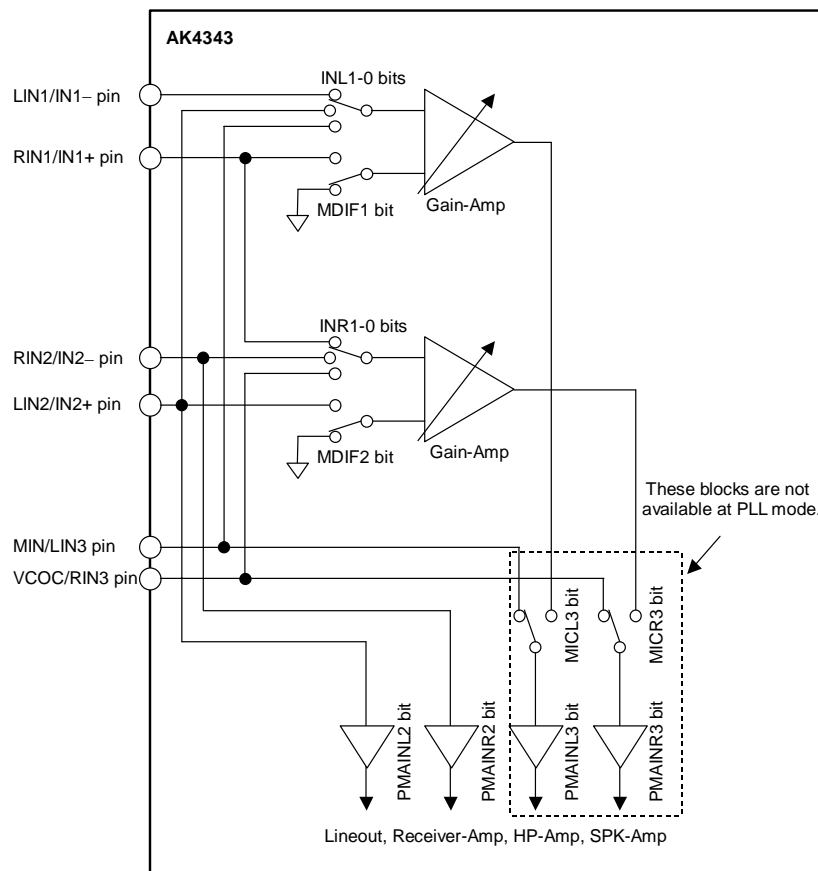

Figure 31. Input Selector

**<Input Selector Setting Example>**

In case that IN1+/- pins are used as full-differential mic input and LIN2/RIN2 pins are used as stereo line input, it is recommended that the following two modes are set by register setting according to each case.

| MDIF1 bit | MDIF2 bit | INL1 bit | INL0 bit | INR1 bit | INR0 bit | Lch    | Rch  |
|-----------|-----------|----------|----------|----------|----------|--------|------|
| 1         | 0         | 0        | 0        | 0        | 1        | IN1+/- | RIN2 |
| 0         | 0         | 0        | 1        | 0        | 1        | LIN2   | RIN2 |

Table 21. Line In Path Select Example

■ Gain Amplifier

The AK4343 has a gain amplifier. The gain is selected by the MGAIN1-0 bits (see Table 22). The typical input impedance is 60kΩ(typ)@MGAIN1-0 bits = “00” or 30kΩ(typ)@MGAIN1-0 bits = “01”, “10” or “11”.

| MGAIN1 bit | MGAIN0 bit | Input Gain |
|------------|------------|------------|
| 0          | 0          | 0dB        |
| 0          | 1          | +20dB      |
| 1          | 0          | +26dB      |
| 1          | 1          | +32dB      |

Default

Table 22. Input Gain

■ Digital EQ/HPF/LPF

The AK4343 performs wind-noise reduction filter, stereo separation emphasis, gain compensation and ALC (Automatic Level Control) by digital domain for input data (Figure 32). FIL1, FIL3 and EQ blocks are IIR filters of 1<sup>st</sup> order. The filter coefficient of FIL3, EQ and FIL1 blocks can be set to any value. Refer to the section of “ALC operation” about ALC.

FIL3 coefficient also sets the attenuation of the stereo separation emphasis.

The combination of GN1-0 bit (Table 23) and EQ coefficient set the compensation gain.

FIL1 and FIL3 blocks become HPF when F1AS and F3AS bits are “0” and become LPF when F1AS and F3AS bits are “1”, respectively.

When EQ and FIL1 bits are “0”, EQ and FIL1 blocks become “through” (0dB). When FIL3 bit is “0”, FIL3 block become “MUTE”. When each filter coefficient is changed, each filter should be set to “through” (“MUTE” in case of FIL3).

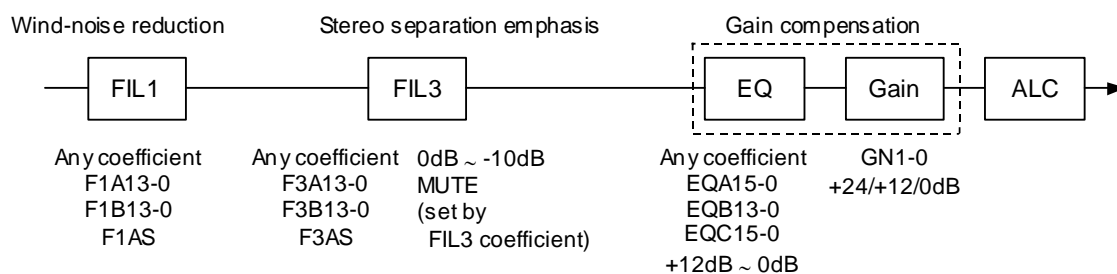

Figure 32. Digital EQ/HPF/LPF

| GN1 | GN0 | Gain  |
|-----|-----|-------|
| 0   | 0   | 0dB   |
| 0   | 1   | +12dB |
| 1   | x   | +24dB |

Default

Table 23. Gain select of gain block (x: Don't care)

[Filter Coefficient Setting]

1) When FIL1 and FIL2 are set to “HPF”

fs: Sampling frequency  
 fc: Cut-off frequency  
 f: Input signal frequency  
 K: Filter gain [dB] (Filter gain of should be set to 0dB.)

Register setting

FIL1: F1AS bit = “0”, F1A[13:0] bits =A, F1B[13:0] bits =B  
 FIL3: F3AS bit = “0”, F3A[13:0] bits =A, F3B[13:0] bits =B  
 (MSB=F1A13, F1B13, F3A13, F3B13; LSB=F1A0, F1B0, F3A0, F3B0)

$$A = 10^{K/20} \times \frac{1 / \tan (\pi f c / f s)}{1 + 1 / \tan (\pi f c / f s)}, \quad B = \frac{1 - 1 / \tan (\pi f c / f s)}{1 + 1 / \tan (\pi f c / f s)}$$

| Transfer function                         | Amplitude  | Phase   |
|---|--|---|
| $H(z) = A \frac{1 - z^{-1}}{1 + Bz^{-1}}$ | $M(f) = A \sqrt{\frac{2 - 2\cos(2\pi f / fs)}{1 + B^2 + 2B\cos(2\pi f / fs)}}$ | $\theta(f) = \tan^{-1} \frac{(B+1)\sin(2\pi f / fs)}{1 - B + (B-1)\cos(2\pi f / fs)}$ |

2) When FIL1 and FIL2 are set to “LPF”

fs: Sampling frequency  
 fc: Cut-off frequency  
 f: Input signal frequency  
 K: Filter gain [dB] (Filter gain of FIL1 should be set to 0dB.)

Register setting

FIL1: F1AS bit = “1”, F1A[13:0] bits =A, F1B[13:0] bits =B  
 FIL3: F3AS bit = “1”, F3A[13:0] bits =A, F3B[13:0] bits =B  
 (MSB=F1A13, F1B13, F3A13, F3B13; LSB=F1A0, F1B0, F3A0, F3B0)

$$A = 10^{K/20} \times \frac{1}{1 + 1 / \tan (\pi f c / f s)}, \quad B = \frac{1 - 1 / \tan (\pi f c / f s)}{1 + 1 / \tan (\pi f c / f s)}$$

| Transfer function                         | Amplitude  | Phase   |
|---|--|---|
| $H(z) = A \frac{1 + z^{-1}}{1 + Bz^{-1}}$ | $M(f) = A \sqrt{\frac{2 + 2\cos(2\pi f / fs)}{1 + B^2 + 2B\cos(2\pi f / fs)}}$ | $\theta(f) = \tan^{-1} \frac{(B-1)\sin(2\pi f / fs)}{1 + B + (B+1)\cos(2\pi f / fs)}$ |

3) EQ

fs: Sampling frequency  
 fc<sub>1</sub>: Pole frequency  
 fc<sub>2</sub>: Zero-point frequency  
 f: Input signal frequency  
 K: Filter gain [dB] (Maximum +12dB)

Register setting

EQA[15:0] bits =A, EQB[13:0] bits =B, EQC[15:0] bits =C  
 (MSB=EQA15, EQB13, EQC15; LSB=EQA0, EQB0, EQC0)

$$A = 10^{K/20} \times \frac{1 + 1 / \tan(\pi f c_2 / f_s)}{1 + 1 / \tan(\pi f c_1 / f_s)}, \quad B = \frac{1 - 1 / \tan(\pi f c_1 / f_s)}{1 + 1 / \tan(\pi f c_1 / f_s)}, \quad C = 10^{K/20} \times \frac{1 - 1 / \tan(\pi f c_2 / f_s)}{1 + 1 / \tan(\pi f c_1 / f_s)}$$

| Transfer function                        | Amplitude  | Phase  |
|--|--|--|
| $H(z) = \frac{A + Cz^{-1}}{1 + Bz^{-1}}$ | $M(f) = \sqrt{\frac{A^2 + C^2 + 2AC\cos(2\pi f/f_s)}{1 + B^2 + 2B\cos(2\pi f/f_s)}}$ | $\theta(f) = \tan^{-1} \frac{(AB-C)\sin(2\pi f/f_s)}{A + BC + (AB+C)\cos(2\pi f/f_s)}$ |

[Translation the filter coefficient calculated by the equations above from real number to binary code (2's complement)]

$$X = (\text{Real number of filter coefficient calculated by the equations above}) \times 2^{13}$$

X should be rounded to integer, and then should be translated to binary code (2's complement).  
 MSB of each filter coefficient setting register is sine bit.

[Filter Coefficient Setting Example]

1) FIL1 block

Example: HPF, fs=44.1kHz, fc=100Hz  
 F1AS bit = "0"  
 F1A[13:0] bits = 01 1111 1100 0110  
 F1B[13:0] bits = 10 0000 0111 0100

2) EQ block

Example: fs=44.1kHz, fc<sub>1</sub>=300Hz, fc<sub>2</sub>=3000Hz, Gain=+8dB

EQA[15:0] bits = 0000 1001 0110 1110  
 EQB[13:0] bits = 10 0001 0101 1001  
 EQC[15:0] bits = 1111 1001 1110 1111

■ ALC Operation

The ALC (Automatic Level Control) is done by ALC block when ALC bit is “1”.

1. ALC Limiter Operation

During the ALC limiter operation, when either Lch or Rch exceeds the ALC limiter detection level (Table 24), the AVL and AVR values (same value) are attenuated automatically by the amount defined by the ALC limiter ATT step (Table 25).

When ZELMN bit = “0” (zero cross detection is enabled), the AVL and AVR values are changed by ALC limiter operation at the individual zero crossing points of Lch and Rch or at the zero crossing timeout. ZTM1-0 bits set the zero crossing timeout period of both ALC limiter and recovery operation (Table 26).

When ZELMN bit = “1” (zero cross detection is disabled), AVL and AVR values are immediately (period: 1/fs) changed by ALC limiter operation. Attenuation step is fixed to 1 step regardless as the setting of LMAT1-0 bits.

The attenuation operation is done continuously until the input signal level becomes ALC limiter detection level (Table 24) or less. After completing the attenuation operation, unless ALC bit is changed to “0”, the operation repeats when the input signal level exceeds LMTH1-0 bits.

| LMTH1 | LMTH0 | ALC Limier Detection Level        | ALC Recovery Waiting Counter Reset Level                   | Default |
|-------|-------|-----------------------------------|--|---------|
| 0     | 0     | ALC Output $\geq -2.5\text{dBFS}$ | $-2.5\text{dBFS} > \text{ALC Output} \geq -4.1\text{dBFS}$ | Default |
| 0     | 1     | ALC Output $\geq -4.1\text{dBFS}$ | $-4.1\text{dBFS} > \text{ALC Output} \geq -6.0\text{dBFS}$ |         |
| 1     | 0     | ALC Output $\geq -6.0\text{dBFS}$ | $-6.0\text{dBFS} > \text{ALC Output} \geq -8.5\text{dBFS}$ |         |
| 1     | 1     | ALC Output $\geq -8.5\text{dBFS}$ | $-8.5\text{dBFS} > \text{ALC Output} \geq -12\text{dBFS}$  |         |

Table 24. ALC Limiter Detection Level / Recovery Counter Reset Level

| ZELMN | LMAT1 | LMAT0 | ALC Limiter ATT Step |         | Default |
|-------|-------|-------|----------------------|---------|---------|
| 0     | 0     | 0     | 1 step               | 0.375dB | Default |
|       | 0     | 1     | 2 step               | 0.750dB |         |
|       | 1     | 0     | 4 step               | 1.500dB |         |
|       | 1     | 1     | 8 step               | 3.000dB |         |
| 1     | x     | x     | 1step                | 0.375dB |         |

Table 25. ALC Limiter ATT Step (x: Don't care)

| ZTM1 | ZTM0 | Zero Crossing Timeout Period |       |       |         | Default |
|------|------|------------------------------|-------|-------|---------|---------|
|      |      |                              | 8kHz  | 16kHz | 44.1kHz |         |
| 0    | 0    | 128/fs                       | 16ms  | 8ms   | 2.9ms   | Default |
| 0    | 1    | 256/fs                       | 32ms  | 16ms  | 5.8ms   |         |
| 1    | 0    | 512/fs                       | 64ms  | 32ms  | 11.6ms  |         |
| 1    | 1    | 1024/fs                      | 128ms | 64ms  | 23.2ms  |         |

Table 26. ALC Zero Crossing Timeout Period

## 2. ALC Recovery Operation

The ALC recovery operation waits for the WTM2-0 bits (Table 27) to be set after completing the ALC limiter operation. If the input signal does not exceed “ALC recovery waiting counter reset level” (Table 24) during the wait time, the ALC recovery operation is done. The AVL and AVR values are automatically incremented by RGAIN1-0 bits (Table 28) up to the set reference level (Table 29) with zero crossing detection which timeout period is set by ZTM1-0 bits (Table 26). Then the AVL and AVR are set to the same value for both channels. The ALC recovery operation is done at a period set by WTM2-0 bits. When zero cross is detected at both channels during the wait period set by WTM2-0 bits, the ALC recovery operation waits until WTM2-0 period and the next recovery operation is done. If ZTM1-0 is longer than WTM2-0 and no zero crossing occurs, the ALC recovery operation is done at a period set by ZTM1-0 bits.

For example, when the current AVOL value is 30H and RGAIN1-0 bits are set to “01”, AVOL is changed to 32H by the auto limiter operation and then the input signal level is gained by 0.75dB (=0.375dB x 2). When the AVOL value exceeds the reference level (REF7-0), the AVOL values are not increased.

When

“ALC recovery waiting counter reset level (LMTH1-0) ≤ Output Signal < ALC limiter detection level (LMTH1-0)” during the ALC recovery operation, the waiting timer of ALC recovery operation is reset. When

“ALC recovery waiting counter reset level (LMTH1-0) > Output Signal”, the waiting timer of ALC recovery operation starts.

The ALC operation corresponds to the impulse noise. When the impulse noise is input, the ALC recovery operation becomes faster than a normal recovery operation (Fast Recovery Operation). When large noise is input to microphone instantaneously, the quality of small level in the large noise can be improved by this fast recovery operation. The speed of fast recovery operation is set by RFST1-0 bits (Table 30).

| WTM2 | WTM1 | WTM0 | ALC Recovery Operation Waiting Period |        |         | Default |
|------|------|------|---------------------------------------|--------|---------|---------|
|      |      |      | 8kHz                                  | 16kHz  | 44.1kHz |         |
| 0    | 0    | 0    | 128/fs                                | 16ms   | 8ms     | 2.9ms   |
| 0    | 0    | 1    | 256/fs                                | 32ms   | 16ms    | 5.8ms   |
| 0    | 1    | 0    | 512/fs                                | 64ms   | 32ms    | 11.6ms  |
| 0    | 1    | 1    | 1024/fs                               | 128ms  | 64ms    | 23.2ms  |

Table 31. Example of the ALC setting

The following registers should not be changed during the ALC operation. These bits should be changed after the ALC operation is finished by ALC bit = "0" or PMDAC bit = "0".

- LMTH1-0, LMAT1-0, WTM2-0, ZTM1-0, RGAIN1-0, REF7-0, ZELMN, RFST1-0

Figure 33. Registers set-up sequence at ALC operation

■ Digital Volume at ALC Block (Manual Mode)

The digital volume at ALC block becomes a manual mode when ALC bit is “0”. This mode is used in the case shown below.

1. After exiting reset state, set-up the registers for the ALC operation (ZTM1-0, LMTH1-0 and etc)
2. When the registers for the ALC operation (Limiter period, Recovery period and etc) are changed.  
For example; when the change of the sampling frequency.

AVL7-0 and AVR7-0 bits set the gain of the volume control at ALC block (Table 32). The AVOL value is changed at zero crossing or timeout. Zero crossing timeout period is set by ZTM1-0 bits.

When ALC is not used, AVL7-0 and AVR7-0 bits should be set to “91H” (0dB).

| AVL7-0<br>AVR7-0 | GAIN (dB) | Step               |
|------------------|-----------|--------------------|
| F1H              | +36.0     | 0.375dB<br>Default |
| F0H              | +35.625   |                    |
| EFH              | +35.25    |                    |
| :                | :         |                    |
| E2H              | +30.375   |                    |
| E1H              | +30.0     |                    |
| E0H              | +29.625   |                    |
| :                | :         |                    |
| 03H              | -53.25    |                    |
| 02H              | -53.625   |                    |
| 01H              | -54       |                    |
| 00H              | MUTE      |                    |

Table 32. ALC Block Digital Volume Setting

When writing to the AVL7-0 and AVR7-0 bits continuously, the control register should be written by an interval more than zero crossing timeout. If not, AVL and AVR are not changed since zero crossing counter is reset at every write operation. If the same register value as the previous write operation is written to AVL and AVR, this write operation is ignored and zero crossing counter is not reset. Therefore, AVL and AVR can be written by an interval less than zero crossing timeout.

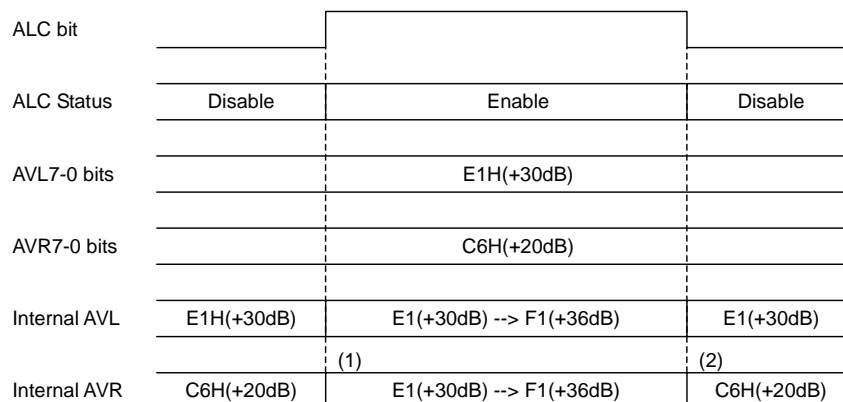

Figure 34. AVOL value during ALC operation

- (1) The AVL value becomes the start value if the AVL and AVR are different when the ALC starts. The wait time from ALC bit = "1" to ALC operation start by AVL7-0 bits is at most recovery time (WTM2-0 bits) plus zerocross timeout period (ZTM1-0 bits).
- (2) Writing to AVL and AVR registers (09H and 0CH) is ignored during ALC operation. After ALC is disabled, the AVOL changes to the last written data by zero crossing or timeout. When ALC is enabled again, ALC bit should be set to "1" by an interval more than zero crossing timeout period after ALC bit = "0".

■ De-emphasis Filter

The AK4343 includes the digital de-emphasis filter ( $t_c = 50/15\mu s$ ) by IIR filter. Setting the DEM1-0 bits enables the de-emphasis filter (Table 33).

| DEM1 | DEM0 | Mode    |
|------|------|---------|
| 0    | 0    | 44.1kHz |
| 0    | 1    | OFF     |
| 1    | 0    | 48kHz   |
| 1    | 1    | 32kHz   |

Default

Table 33. De-emphasis Control

■ Bass Boost Function

The BST1-0 bits control the amount of low frequency boost applied to the DAC output signal (Table 34). If the BST1-0 bits are set to "01" (MIN Level), use a  $47\mu F$  capacitor for AC-coupling. If the boosted signal exceeds full scale, the analog output clips to the full scale. Figure 35 shows the boost frequency response at  $-20dB$  signal input.

Figure 35. Bass Boost Frequency Response (fs=44.1kHz)

| BST1 | BST0 | Mode |
|------|------|------|
| 0    | 0    | OFF  |
| 0    | 1    | MIN  |
| 1    | 0    | MID  |
| 1    | 1    | MAX  |

Default

Table 34. Bass Boost Control

## ■ Digital Output Volume

The AK4343 has a digital output volume (256 levels, 0.5dB step, Mute). The volume can be set by the DVL7-0 and DVR7-0 bits. The volume is included in front of a DAC block. The input data of DAC is changed from +12 to -115dB or MUTE. When the DVOLC bit = "1", the DVL7-0 bits control both Lch and Rch attenuation levels. When the DVOLC bit = "0", the DVL7-0 bits control Lch level and DVR7-0 bits control Rch level. This volume has a soft transition function. The DVTM bit sets the transition time between set values of DVL/R7-0 bits as either 1061/fs or 256/fs (Table 36). When DVTM bit = "0", a soft transition between the set values occurs (1062 levels). It takes 1061/fs (=24ms@fs=44.1kHz) from 00H (+12dB) to FFH (MUTE).

| DVL/R7-0 | Gain               |
|----------|--------------------|
| 00H      | +12.0dB            |
| 01H      | +11.5dB            |
| 02H      | +11.0dB            |
| :        | :                  |
| 18H      | 0dB                |
| :        | :                  |
| FDH      | -114.5dB           |
| FEH      | -115.0dB           |
| FFH      | MUTE ( $-\infty$ ) |

Default

Table 35. Digital Volume Code Table

| DVTM bit | Transition time between DVL/R7-0 bits = 00H and FFH |         |            |
|----------|---|---------|------------|
|          | Setting   | fs=8kHz | fs=44.1kHz |
| 0        | 1061/fs   | 133ms   | 24ms       |
| 1        | 256/fs  | 32ms    | 6ms        |

Default

Table 36. Transition Time Setting of Digital Output Volume

### ■ Soft Mute

Soft mute operation is performed in the digital domain. When the SMUTE bit goes to “1”, the output signal is attenuated by  $-\infty$  (“0”) during the cycle set by the DVTM bit. When the SMUTE bit is returned to “0”, the mute is cancelled and the output attenuation gradually changes to the value set by the DVL/R7-0 bits during the cycle set of the DVTM bit. If the soft mute is cancelled within the cycle set by the DVTM bit after starting the operation, the attenuation is discontinued and returned to the value set by the DVL/R7-0 bits. The soft mute is effective for changing the signal source without stopping the signal transmission (Figure 36).

Figure 36. Soft Mute Function

- (1) The output signal is attenuated until  $-\infty$  (“0”) by the cycle set by the DVTM bit.
- (2) Analog output corresponding to digital input has the group delay (GD).
- (3) If the soft mute is cancelled within the cycle set by the DVTM bit, the attenuation is discontinued and returned to the value set by the DVL/R7-0 bits.

■ Analog Mixing: Stereo Input (LIN2/RIN2, AIN3 bit = “1”: LIN3/RIN3 pins)

When PMAINL2=PMAINR2 bits = “1”, LIN2 and RIN2 pins can be used as stereo line input for analog mixing. When the LINS2 and RINS2 bits are set to “1”, the input signal from the LIN2/RIN2 pins is output to Speaker-Amp. When the LINH2 and RINH2 bits are set to “1”, the input signal from the LIN2/RIN2 pins is output to Headphone-Amp. When the LINL2/RINR2 bits are set to “1”, the input signal from the LIN2/RIN2 pins is output to the stereo line output amplifier.

When AIN3 bit = “1”, MIN and VCOC pins becomes LIN3 and RIN3 pins, respectively. In this case, PLL is not available. When PMAINL3=PMAINR3 bits = “1”, LIN2 and RIN2 pins can be used as stereo line input for analog mixing. When PMMICL=PMMICR=MICL3=MICR3 bits = “1”, analog mixing source is changed from LIN3/RIN3 input to Gain-Amp output signal. When the LINS3 and RINS3 bits are set to “1”, the input signal from the LIN3/RIN3 pins is output to Speaker-Amp. When the LINH3 and RINH3 bits are set to “1”, the input signal from the LIN3/RIN3 pins is output to Headphone-Amp. When the LINL3/RINR3 bits are set to “1”, the input signal from the LIN3/RIN3 pins is output to the stereo line output amplifier.

When the analog mixing is used at MICL3=MICR3 bits = “0”, the input resistance of LIN3/RIN3 pins becomes 30kΩ (typ) at MGAIN1-0 bits = “00” and 20kΩ (typ) at MGAIN1-0 bits = “01”, “10” or “11”, respectively. When the analog mixing is used at MICL3=MICR3 bits = “1”, the input resistance of LIN3/RIN3 pins becomes 60kΩ (typ) at MGAIN1-0 bits = “00” and 30kΩ (typ) at MGAIN1-0 bits = “01”, “10” or “11”, respectively.

Table 37, Table 38, Table 39 and Table 40 show the typical gain.

| 11           | +6.63dB                       | +8.63dB       |         |

Table 40. LIN2/RIN2/LIN3/RIN3 Input → Speaker-Amp Output Gain (typ)

■ Analog Mixing: Mono Input

When AIN3 bit = “0”, MIN pin is used as mono input for analog mixing. When the PMMIN bit is set to “1”, the mono input is powered-up. When the MINS bit is set to “1”, the input signal from the MIN pin is output to Speaker-Amp. When the MINH bit is set to “1”, the input signal from the MIN pin is output to Headphone-Amp. When the MINL bit is set to “1”, the input signal from the MIN pin is output to the stereo line output amplifier. The external resistor  $R_i$  adjusts the signal level of MIN input. Table 41, Table 43 and Table 44 show the typical gain example at  $R_i = 20k\Omega$ . This gain is in inverse proportion to  $R_i$ .

Figure 40. Block Diagram of MIN pin

| LOVL bit | MIN → LOUT/ROUT |         |

|              | ALC bit = “0” | ALC bit = “1” |         |
| 00           | +4.43dB       | +6.43dB       | Default |
| 01           | +6.43dB       | +8.43dB       |         |
| 10           | +10.65dB      | +12.65dB      |         |
| 11           | +12.65dB      | +14.65dB      |         |

Table 44. MIN Input → Speaker-Amp Output Gain (typ) at  $R_i = 20k\Omega$

■ Stereo Line Output (LOUT/ROUT pins)

When DACL bit is “1”, Lch/Rch signal of DAC is output from the LOUT/ROUT pins which is single-ended. When DACL bit is “0”, output signal is muted and LOUT/ROUT pins output VCOM voltage. The load impedance is 10kΩ (min.). When the PMLO=LOPS bits = “0”, the stereo line output enters power-down mode and the output is pulled-down to AVSS by 100kΩ(typ). When the LOPS bit is “1”, stereo line output enters power-save mode. Pop noise at power-up/down can be reduced by changing PMLO bit at LOPS bit = “1”. In this case, output signal line should be pulled-down to AVSS by 20kΩ after AC coupled as Figure 42. Rise/Fall time is 300ms(max) at C=1μF and AVDD=3.3V. When PMLO=LOPS bits = “1”, stereo line output is in normal operation.

LOVL bit set the gain of stereo line output.

Figure 41. Stereo Line Output

| LOPS | PMLO | Mode             | LOUT/ROUT pin     |         |
|------|------|------------------|-------------------|---------|
| 0    | 0    | Power-down       | Pull-down to AVSS | Default |
|      | 1    | Normal Operation | Normal Operation  |         |
| 1    | 0    | Power-save       | Fall down to AVSS |         |
|      | 1    | Power-save       | Rise up to VCOM   |         |

Table 45. Stereo Line Output Mode Select (x: Don't care)

| LOVL | Gain | Output Voltage (typ) |         |
|------|------|----------------------|---------|
| 0    | +0dB | 0.6 x AVDD           | Default |
| 1    | +2dB | 0.757 x AVDD         |         |

Table 46. Stereo Line Output Volume Setting

Figure 42. External Circuit for Stereo Line Output (in case of using Pop Reduction Circuit)

**<Stereo Line Output Control Sequence (in case of using Pop Reduction Circuit)>**

Figure 43. Stereo Line Output Control Sequence (in case of using Pop Reduction Circuit)

- (1) Set LOPS bit = "1". Stereo line output enters the power-save mode.
- (2) Set PMLO bit = "1". Stereo line output exits the power-down mode.  
LOUT and ROUT pins rise up to VCOM voltage. Rise time is 200ms (max 300ms) at  $C=1\mu\text{F}$  and  $\text{AVDD}=3.3\text{V}$ .
- (3) Set LOPS bit = "0" after LOUT and ROUT pins rise up. Stereo line output exits the power-save mode.  
Stereo line output is enabled.
- (4) Set LOPS bit = "1". Stereo line output enters power-save mode.
- (5) Set PMLO bit = "0". Stereo line output enters power-down mode.  
LOUT and ROUT pins fall down to AVSS. Fall time is 200ms (max 300ms) at  $C=1\mu\text{F}$  and  $\text{AVDD}=3.3\text{V}$ .
- (6) Set LOPS bit = "0" after LOUT and ROUT pins fall down. Stereo line output exits the power-save mode.

**<Analog Mixing Circuit for Stereo Line Output>**

When AIN3 bit = "0", DACL, MINL, LINL2 and RINR2 bits controls each path switch.  
 MIN path mixing gain is 0dB(typ)@LOVL bit = "0" when the external input resistance is 20kΩ.  
 LIN2, RIN2 and DAC pathes mixing gain is 0dB(typ)@LOVL bit = "0".

Figure 44. LOUT Mixing Circuit (AIN3 bit = "0", LOVL bit = "0")

Figure 45. ROUT Mixing Circuit (AIN3 bit = "0", LOVL bit = "0")

When AIN3 bit = "1", DACL, LINL2, RINR2, LINL3, RINR3, MICL3 and MICR3 bits controls each path switch. All pathes mixing gain is 0dB(typ)@LOVL bit = "0".

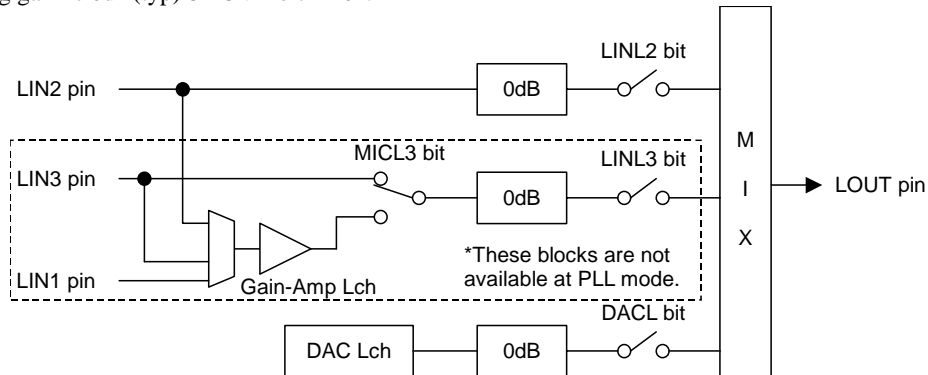

Figure 46. LOUT Mixing Circuit (AIN3 bit = "1", LOVL bit = "0")

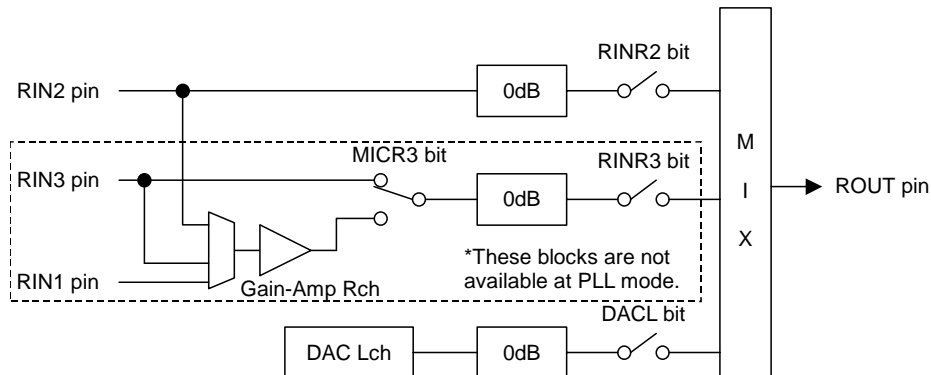

Figure 47. ROUT Mixing Circuit (AIN3 bit = "1", LOVL bit = "0")

**■ Mono Receiver Output (RCP/RCN pins)**

When RCV bit = "1", LOUT/ROUT pins become RCP/RCN pins, respectively. Lch/Rch signal of DAC or LIN2/RIN2/LIN3/RIN3 is output from the RCP/RCN pins which is BTL as (L+R)/2 signal. The load impedance is 32Ω (min). When the PMLO bit = "0", the mono receiver output enters power-down mode and the output is Hi-Z. When the PMLO bit is "1" and LOPS bit is "1", mono receiver output enters power-save mode. Pop noise at power-up/down can be reduced by changing PMLO bit at LOPS bit = "0". When PMLO bit = "1" and LOPS bit = "0", mono receiver output enters in normal operation. LOVL bit set the gain of mono receiver output.

Figure 48. Mono Receiver Output

| LOVL | Gain | Output Voltage (typ) |         |
|------|------|----------------------|---------|
| 0    | +6dB | 0.59 x AVDD @-6dBFS  | Default |
| 1    | +8dB | 0.59 x AVDD @-8dBFS  |         |

Table 47. Mono Receiver Output Volume Setting

| PMLO | LOPS | Mode             | RCP              | RCN              |         |
|------|------|------------------|------------------|------------------|---------|
| 0    | x    | Power-down       | Hi-Z             | Hi-Z             | Default |
| 1    | 1    | Power-save       | Hi-Z             | VCOM/2           |         |
|      | 0    | Normal Operation | Normal Operation | Normal Operation |         |

Table 48. Receiver-Amp Mode Setting (x: Don't care)

Figure 49. Power-up/Power-down Timing for Receiver-Amp

**<Analog Mixing Circuit for Receiver Output>**

When AIN3 bit = "0", DACL, MINL, LINL2 and RINR2 bits controls each path switch.  
 MIN path mixing gain is +6dB(typ)@LOVL bit = "0" when the external input resistance is 20kΩ.  
 LIN2, RIN2 and DAC pathes mixing gain is 0dB(typ)@LOVL bit = "0".

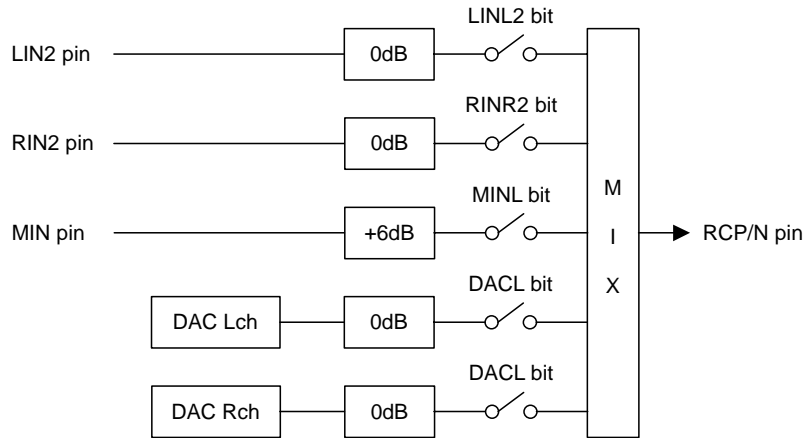

Figure 50. Receiver Mixing Circuit (AIN3 bit = "0", LOVL bit = "0")

When AIN3 bit = "1", DACL, LINL2, RINR2, LINL3, RINR3, MICL3 and MICR3 bits controls each path switch. All pathes mixing gain is 0dB(typ)@LOVL bit = "0".

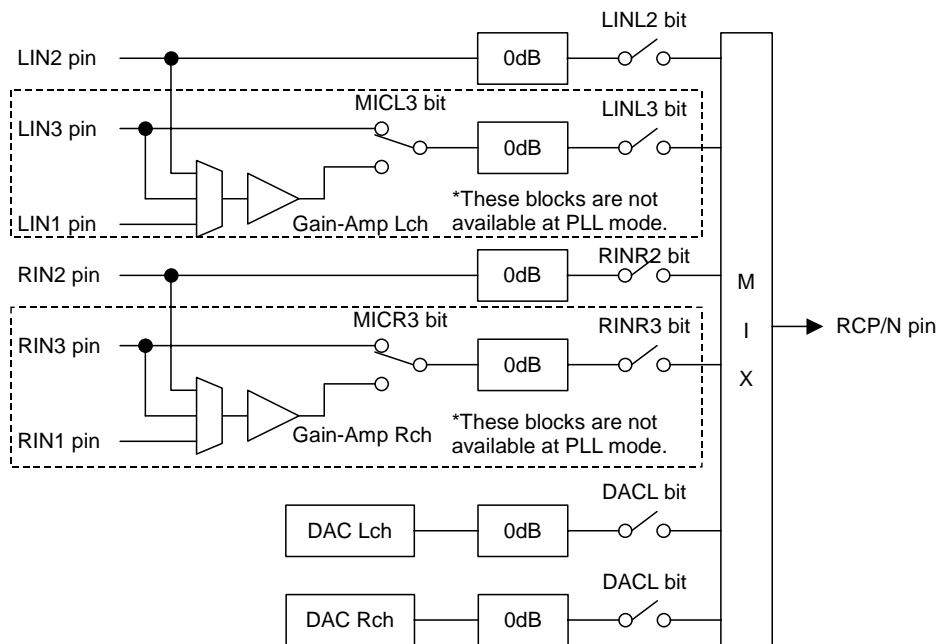

Figure 51. Receiver Mixing Circuit (AIN3 bit = "1", LOVL bit = "0")

## ■ Headphone Output

Power supply voltage for the Headphone-Amp is supplied from the HVDD pin and centered on the HVDD/2 voltage at VBAT bit = "0". The load resistance is 16Ω (min). HPG bit selects the output voltage (see Table 49).

| HPG bit              | 0          | 1           |
|----------------------|------------|-------------|
| Output Voltage [Vpp] | 0.6 x AVDD | 0.91 x AVDD |

Table 49. Headphone-Amp Output Voltage

When the HPMTN bit is "0", the common voltage of Headphone-Amp falls and the outputs (HPL and HPR pins) go to "L" (HVSS). When the HPMTN bit is "1", the common voltage rises to HVDD/2 at VBAT bit = "0". A capacitor between the MUTET pin and ground reduces pop noise at power-up. Rise/Fall time constant is in proportional to HVDD voltage and the capacitor at MUTET pin.

[Example]: A capacitor between the MUTET pin and ground = 1.0μF, HVDD=3.3V:

Rise/fall time constant:  $\tau = 100\text{ms}(\text{typ}), 250\text{ms}(\text{max})$

Time until the common goes to HVSS when HPMTN bit = "1" → "0": 500ms(max)

When PMHPL and PMHPR bits are "0", the Headphone-Amp is powered-down, and the outputs (HPL and HPR pins) go to "L" (HVSS).

Figure 52. Power-up/Power-down Timing for Headphone-Amp

- (1) Headphone-Amp power-up (PMHPL, PMHPR bit = "1"). The outputs are still HVSS.
- (2) Headphone-Amp common voltage rises up (HPMTN bit = "1"). Common voltage of Headphone-Amp is rising.
- (3) Headphone-Amp common voltage falls down (HPMTN bit = "0"). Common voltage of Headphone-Amp is falling.
- (4) Headphone-Amp power-down (PMHPL, PMHPR bit = "0"). The outputs are HVSS. If the power supply is switched off or Headphone-Amp is powered-down before the common voltage goes to HVSS, some POP noise occurs.

When BOOST=OFF, the cut-off frequency ( $f_c$ ) of Headphone-Amp depends on the external resistor and capacitor. This  $f_c$  can be shifted to lower frequency by using bass boost function. Table 50 shows the cut off frequency and the output power for various resistor/capacitor combinations. The headphone impedance  $R_L$  is  $16\Omega$ . Output powers are shown at  $HVDD = 2.7, 3.0$  and  $3.3V$ . The output voltage of headphone is  $0.6 \times AVDD$  (Vpp).

When an external resistor  $R$  is smaller than  $12\Omega$ , put an oscillation prevention circuit ( $0.22\mu F \pm 20\%$  capacitor and  $10\Omega \pm 20\%$  resistor) because it has the possibility that Headphone-Amp oscillates.

Figure 53. External Circuit Example of Headphone

| HPG bit | R [ $\Omega$ ] | C [ $\mu F$ ] | $f_c$ [Hz]<br>BOOST<br>=OFF | $f_c$ [Hz]<br>BOOST<br>=MIN<br>$f_s=44.1kHz$ | Output Power [mW]@0dBFS |                        |                      |

Table 50. External Circuit Example

Note 38. Output power at  $16\Omega$  load.

Note 39. Output signal is clipped.

<Headphone-Amp PSRR>

When HVDD is directly supplied from the battery in the mobile phone system, RF noise may influences headphone output performance. When VBAT bit is set to "1", HP-Amp PSRR for the noise applied to HVDD is improved. In this case, HP-Amp common voltage is  $0.64 \times AVDD$  (typ). When AVDD is 3.3V, common voltage is 2.1V. Therefore, when HVDD voltage becomes lower than 4.2V, the output signal will be clipped easily.

| VBAT bit           | 0                 | 1                  |
|--------------------|-------------------|--------------------|
| Common Voltage [V] | $0.5 \times HVDD$ | $0.64 \times AVDD$ |

Table 51. HP-Amp Common Voltage

**<Analog Mixing Circuit for Headphone Output>**

When AIN3 bit = "0", DACH, MINH, LINH2 and RINH2 bits controls each path switch.  
 MIN path mixing gain is -20dB(typ)@HPG bit = "0" when the external input resistance is 20kΩ.  
 LIN2, RIN2 and DAC pathes mixing gain is 0dB(typ)@HPG bit = "0".

## ■ Speaker Output

Power supply for Speaker-Amp (HVDD) is 2.6V to 5.25V.

| Speaker Type           | Dynamic Speaker | Piezo (Ceramic) Speaker |
|------------------------|-----------------|-------------------------|
| Load Resistance (min)  | 8Ω              | 50Ω                     |
| Load Capacitance (max) | 30pF            | 3μF                     |

Note 19. Load impedance is total impedance of series resistance (Rseries) and piezo speaker impedance at 1kHz in Figure 58. Load capacitance is capacitance of piezo speaker. When piezo speaker is used, 10Ω or more series resistors should be connected at both SPP and SPN pins, respectively.

Table 52. Speaker Type and Power Supply Range

The DAC or LIN2/RIN2/LIN3/RIN3 signal is input to the Speaker-amp as [(L+R)/2]. The Speaker-amp is mono and BTL output. The gain is set by SPKG1-0 bits. Output level depends on AVDD voltage and SPKG1-0 bits.

| SPKG1-0 bits | Gain          |               | Default |
|--------------|---------------|---------------|---------|
|              | ALC bit = "0" | ALC bit = "1" |         |
| 00           | +4.43dB       | +6.43dB       | Default |
| 01           | +6.43dB       | +8.43dB       |         |
| 10           | +10.65dB      | +12.65dB      |         |
| 11           | +12.65dB      | +14.65dB      |         |

Table 53. SPK-Amp Gain

| AVDD | HVDD | SPKG1-0 bits | SPK-Amp Output (DAC Input = 0dBFS) |  |
|------|------|--------------|------------------------------------|--|
|      |      |              | ALC bit = "0"                      | ALC bit = "1"<br>(LMTH1-0 bits = "00") |
| 3.3V | 3.3V | 00           | 3.30Vpp                            | 3.11Vpp                                |
|      |      | 01           | 4.15Vpp (Note 40)                  | 3.92Vpp                                |
|      |      | 10           | 6.75Vpp (Note 40)                  | 6.37Vpp (Note 40)                      |
|      |      | 11           | 8.50Vpp (Note 40)                  | 8.02Vpp (Note 40)                      |
|      | 5.0V | 00           | 3.30Vpp                            | 3.11Vpp                                |
|      |      | 01           | 4.15Vpp                            | 3.92Vpp                                |
|      |      | 10           | 6.75Vpp (Note 40)                  | 6.37Vpp (Note 40)                      |
|      |      | 11           | 8.50Vpp (Note 40)                  | 8.02Vpp (Note 40)                      |

Note 40. The output level is calculated by assuming that output signal is not clipped. In actual case, output signal may be clipped when DAC outputs 0dBFS signal. DAC output level should be set to lower level by setting digital volume so that Speaker-Amp output level is 4.0Vpp (HVDD=3.3V) or 6.0V (HVDD=5V) or less and output signal is not clipped.

Table 54. SPK-Amp Output Level

<ALC Operation Example of Speaker Playback>

| Register Name     | Comment  | fs=44.1kHz |           |

Table 55. ALC Operation Example of Speaker Playback

<Caution for using Piezo Speaker>

When a piezo speaker is used, resistances more than 10Ω should be inserted between SPP/SPN pins and speaker in series, respectively, as shown in Figure 58. Zener diodes should be inserted between speaker and GND as shown in Figure 58, in order to protect SPK-Amp of AK4343 from the power that the piezo speaker outputs when the speaker is pressured. Zener diodes of the following zener voltage should be used.

$$0.92 \times HVDD \leq \text{Zener voltage of zener diode (ZD in Figure 58)} \leq HVDD + 0.3V$$

Ex) In case of HVDD = 5.0V:  $4.6V \leq ZD \leq 5.3V$

For example, zener diode which zener voltage is 5.1V (Min: 4.97V, Max: 5.24V) can be used.

Figure 58. Speaker Output Circuit (Load Capacitance > 30pF)

**<Speaker-Amp Control Sequence>**

Speaker-Amp is powered-up/down by PMSPK bit. When PMSPK bit is "0", both SPP and SPN pin are in Hi-Z state. When PMSPK bit is "1" and SPPSN bit is "0", the Speaker-Amp enters power-save mode. In this mode, SPP pin is placed in Hi-Z state and SPN pin goes to HVDD/2 voltage. Power-save mode can reduce the pop noise at power-up and power-down.

| PMSPK | SPPSN | Mode             | SPP              | SPN              |         |
|-------|-------|------------------|------------------|------------------|---------|
| 0     | x     | Power-down       | Hi-Z             | Hi-Z             | Default |
| 1     | 0     | Power-save       | Hi-Z             | HVDD/2           |         |
|       | 1     | Normal Operation | Normal Operation | Normal Operation |         |

Figure 59. Power-up/Power-down Timing for Speaker-Amp

**<Analog Mixing Circuit for Speaker Output>**

When AIN3 bit = "0", DACS, MINS, LINS2 and RINS2 bits controls each path switch.  
 MIN path mixing gain is +4.43dB(typ)@SPKG bits = "00" & ALC bit = "0" when the external input resistance is 20kΩ.  
 LIN2, RIN2 and DAC paths mixing gain is -1.57dB(typ)@SPKG bits = "00" & ALC bit = "0".

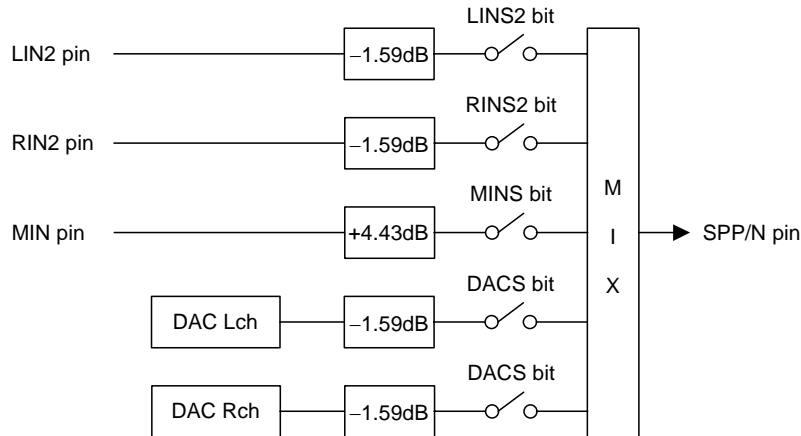

Figure 60. Speaker Mixing Circuit (AIN3 bit = "0", SPKG1-0 bits = "00", ALC bit = "0")

When AIN3 bit = "1", DACS, LINS2, RINS2, LINS3, RINS3, MICL3 and MICR3 bits controls each path switch. All pathes mixing gain is 0dB(typ)@HPG bit = "0".

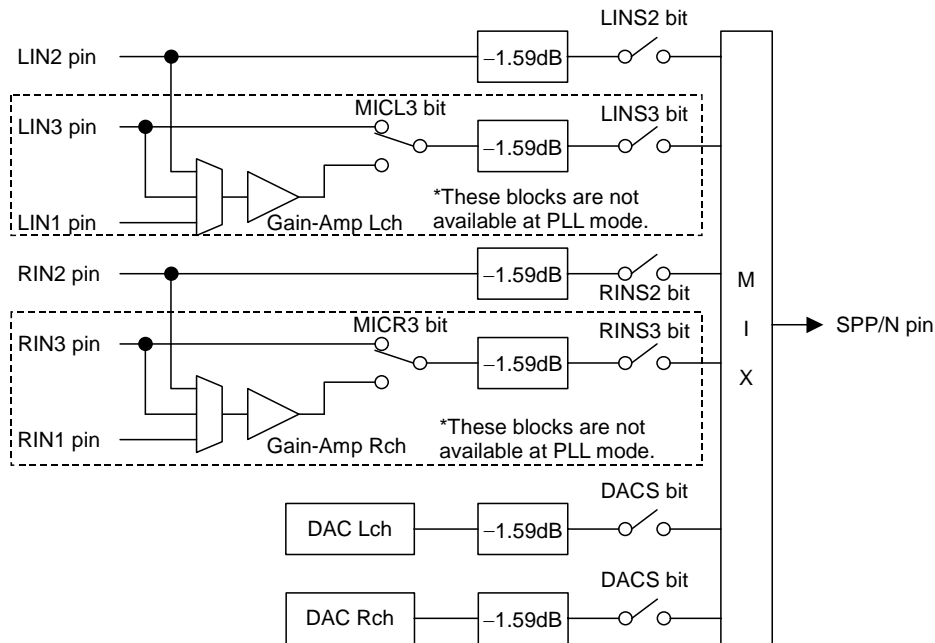

Figure 61. Speaker Mixing Circuit (AIN3 bit = "1", SPKG bits = "00", ALC bit = "0")

■ Serial Control Interface

(1) 3-wire Serial Control Mode (I2C pin = "L")

Internal registers may be written by using the 3-wire  $\mu$ P interface pins (CSN, CCLK and CDTI). The data on this interface consists of a 1-bit Chip address (Fixed to "1"), Read/Write (Fixed to "1"), Register address (MSB first, 6bits) and Control data (MSB first, 8bits). Each bit is clocked in on the rising edge ("↑") of CCLK. Address and data are latched on the 16th CCLK rising edge ("↑") after CSN falling edge("↓"). Clock speed of CCLK is 5MHz (max). The value of internal registers are initialized by PDN pin = "L".

Figure 62. Serial Control I/F Timing

(2) I<sup>2</sup>C-bus Control Mode (I2C pin = "H")

The AK4343 supports the fast-mode I<sup>2</sup>C-bus (max: 400kHz). Pull-up resistors at SDA and SCL pins should be connected to (DVDD+0.3)V or less voltage.

(2)-1. WRITE Operations

Figure 63 shows the data transfer sequence for the I<sup>2</sup>C-bus mode. All commands are preceded by a START condition. A HIGH to LOW transition on the SDA line while SCL is HIGH indicates a START condition (Figure 69). After the START condition, a slave address is sent. This address is 7 bits long followed by an eighth bit that is a data direction bit (R/W). The most significant six bits of the slave address are fixed as "001001". The next bit is CAD0 (device address bit). This bit identifies the specific device on the bus. The hard-wired input pin (CAD0 pin) sets these device address bits (Figure 64). If the slave address matches that of the AK4343, the AK4343 generates an acknowledge and the operation is executed. The master must generate the acknowledge-related clock pulse and release the SDA line (HIGH) during the acknowledge clock pulse (Figure 70). A R/W bit value of "1" indicates that the read operation is to be executed. A "0" indicates that the write operation is to be executed.

The second byte consists of the control register address of the AK4343. The format is MSB first, and those most significant 2-bits are fixed to zeros (Figure 65). The data after the second byte contains control data. The format is MSB first, 8bits (Figure 66). The AK4343 generates an acknowledge after each byte has been received. A data transfer is always terminated by a STOP condition generated by the master. A LOW to HIGH transition on the SDA line while SCL is HIGH defines a STOP condition (Figure 69).

The AK4343 can perform more than one byte write operation per sequence. After receipt of the third byte the AK4343 generates an acknowledge and awaits the next data. The master can transmit more than one byte instead of terminating the write cycle after the first data byte is transferred. After receiving each data packet the internal 6-bit address counter is incremented by one, and the next data is automatically taken into the next address. If the address exceeds 24H prior to generating a stop condition, the address counter will "roll over" to 00H and the previous data will be overwritten.

The data on the SDA line must remain stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW (Figure 71) except for the START and STOP conditions.

Figure 63. Data Transfer Sequence at the I<sup>2</sup>C-Bus Mode

(Those CAD1/0 should match with CAD1/0 pins)

Figure 64. The First Byte

Figure 65. The Second Byte

Figure 66. Byte Structure after the second byte

(2)-2. READ Operations

Set the R/W bit = "1" for the READ operation of the AK4343. After transmission of data, the master can read the next address's data by generating an acknowledge instead of terminating the write cycle after the receipt of the first data word. After receiving each data packet the internal 6-bit address counter is incremented by one, and the next data is automatically taken into the next address. If the address exceeds 24H prior to generating a stop condition, the address counter will "roll over" to 00H and the data of 00H will be read out.

The AK4343 supports two basic read operations: CURRENT ADDRESS READ and RANDOM ADDRESS READ.

(2)-2-1. CURRENT ADDRESS READ

The AK4343 contains an internal address counter that maintains the address of the last word accessed, incremented by one. Therefore, if the last access (either a read or write) were to address n, the next CURRENT READ operation would access data from the address n+1. After receipt of the slave address with R/W bit set to "1", the AK4343 generates an acknowledge, transmits 1-byte of data to the address set by the internal address counter and increments the internal address counter by 1. If the master does not generate an acknowledge to the data but instead generates a stop condition, the AK4343 ceases transmission.

Figure 67. CURRENT ADDRESS READ

(2)-2-2. RANDOM ADDRESS READ

The random read operation allows the master to access any memory location at random. Prior to issuing the slave address with the R/W bit set to "1", the master must first perform a "dummy" write operation. The master issues a start request, a slave address (R/W bit = "0") and then the register address to read. After the register address is acknowledged, the master immediately reissues the start request and the slave address with the R/W bit set to "1". The AK4343 then generates an acknowledge, 1 byte of data and increments the internal address counter by 1. If the master does not generate an acknowledge to the data but instead generates a stop condition, the AK4343 ceases transmission.

Note 41. PDN pin = “L” resets the registers to their default values.

Note 42. Unused bits must contain a “0” value.

## ■ Register Definitions

| Addr | Register Name      | D7 | D6    | D5    | D4    | D3   | D2    | D1 | D0 |
|------|--------------------|----|-------|-------|-------|------|-------|----|----|
| 00H  | Power Management 1 | 0  | PMVCM | PMMIN | PMSPK | PMLO | PMDAC | 0  | 0  |
|      | Default            | 0  | 0     | 0     | 0     | 0    | 0     | 0  | 0  |

PMDAC: DAC Power Management

0: Power-down (Default)

1: Power-up

PMLO: Stereo Line Out Power Management

0: Power-down (Default)

1: Power-up

PMSPK: Speaker-Amp Power Management

0: Power-down (Default)

1: Power-up

PMMIN: MIN Input Power Management

0: Power-down (Default)

1: Power-up

PMMIN or PMAINL3 bit should be set to “1” for playback.

PMVCM: VCOM Power Management

0: Power-down (Default)

1: Power-up

When any blocks are powered-up, the PMVCM bit must be set to “1”. PMVCM bit can be set to “0” only when all power management bits of 00H, 01H, 02H, 10H, 20H and MCKO bits are “0”.

Each block can be powered-down respectively by writing “0” in each bit of this address. When the PDN pin is “L”, all blocks are powered-down regardless as setting of this address. In this case, register is initialized to the default value.

When all power management bits are “0” in the 00H, 01H, 02H and 20H addresses and MCKO bit is “0”, all blocks are powered-down. The register values remain unchanged.

When DAC is not used, external clocks may not be present. When DAC is used, external clocks must always be present.

| Addr | Register Name      | D7 | D6    | D5    | D4    | D3  | D2 | D1   | D0    |
|------|--------------------|----|-------|-------|-------|-----|----|------|-------|
| 01H  | Power Management 2 | 0  | HPMTN | PMHPL | PMHPR | M/S | 0  | MCKO | PMPLL |
|      | Default            | 0  | 0     | 0     | 0     | 0   | 0  | 0    | 0     |

PMPLL: PLL Power Management

0: EXT Mode and Power-Down (Default)

1: PLL Mode and Power-up

MCKO: Master Clock Output Enable

0: Disable: MCKO pin = "L" (Default)

1: Enable: Output frequency is selected by PS1-0 bits.

M/S: Master / Slave Mode Select

0: Slave Mode (Default)

1: Master Mode

PMHPR: Headphone-Amp Rch Power Management

0: Power-down (Default)

1: Power-up

PMHPL: Headphone-Amp Lch Power Management

0: Power-down (Default)

1: Power-up

HPMTN: Headphone-Amp Mute Control

0: Mute (Default)

1: Normal operation

| Addr | Register Name   | D7    | D6   | D5   | D4   | D3 | D2 | D1 | D0     |
|------|-----------------|-------|------|------|------|----|----|----|--------|
| 02H  | Signal Select 1 | SPPSN | MINS | DACS | DACL | 0  | 0  | 0  | MGAIN0 |
|      | Default         | 0     | 0    | 0    | 0    | 0  | 0  | 0  | 1      |

MGAIN1-0: Input Gain Control (See Table 22)

MGAIN1 bit is D5 bit of 03H.

DACL: Switch Control from DAC to Stereo Line Output or Receiver Output

0: OFF (Default)

1: ON

When PMLO bit is "1", DACL bit is enabled. When PMLO bit is "0", the LOUT/ROUT pins go to AVSS.

DACS: Switch Control from DAC to Speaker-Amp

0: OFF (Default)

1: ON

When DACS bit is "1", DAC output signal is input to Speaker-Amp.

MINS: Switch Control from MIN pin to Speaker-Amp

0: OFF (Default)

1: ON

When MINS bit is "1", mono signal is input to Speaker-Amp.

SPPSN: Speaker-Amp Power-Save Mode

0: Power-Save Mode (Default)

1: Normal Operation

When SPPSN bit is "0", Speaker-Amp is in power-save mode. In this mode, SPP pin goes to Hi-Z and SPN pin is outputs HVDD/2 voltage. When PMSPK bit = "1", SPPSN bit is enabled.

| Addr | Register Name   | D7   | D6   | D5     | D4    | D3    | D2   | D1 | D0 |
|------|-----------------|------|------|--------|-------|-------|------|----|----|
| 03H  | Signal Select 2 | LOVL | LOPS | MGAIN1 | SPKG1 | SPKG0 | MINL | 0  | 0  |
|      | Default         | 0    | 0    | 0      | 0     | 0     | 0    | 0  | 0  |

MINL: Switch Control from MIN pin to Stereo Line Output or Receiver Output

0: OFF (Default)

1: ON

When PMLO bit is "1", MINL bit is enabled. When PMLO bit is "0", the LOUT/ROUT pins go to AVSS.

SPKG1-0: Speaker-Amp Output Gain Select (See Table 53)

MGAIN1: Input Gain Control (See Table 22)

LOPS: Stereo Line Output Power-Save Mode

0: Normal Operation (Default)

1: Power-Save Mode

LOVL: Stereo Line Output / Receiver Output Gain Select (See Table 46, Table 47)

0: 0dB/+6dB (Default)

1: +2dB/+8dB

| Addr | Register Name  | D7   | D6   | D5   | D4   | D3   | D2 | D1   | D0   |
|------|----------------|------|------|------|------|------|----|------|------|
| 04H  | Mode Control 1 | PLL3 | PLL2 | PLL1 | PLL0 | BCKO | 0  | DIF1 | DIF0 |
|      | Default        | 0    | 0    | 0    | 0    | 0    | 0  | 1    | 0    |

DIF1-0: Audio Interface Format (See Table 17)

Default: "10" (Left justified)

BCKO: BICK Output Frequency Select at Master Mode (See Table 11)

PLL3-0: PLL Reference Clock Select (See Table 5)

Default: "0000"(LRCK pin)

| Addr | Register Name  | D7  | D6  | D5  | D4   | D3   | D2  | D1  | D0  |
|------|----------------|-----|-----|-----|------|------|-----|-----|-----|
| 05H  | Mode Control 2 | PS1 | PS0 | FS3 | MSBS | BCKP | FS2 | FS1 | FS0 |
|      | Default        | 0   | 0   | 0   | 0    | 0    | 0   | 0   | 0   |

FS3-0: Sampling Frequency Select (See Table 6 and Table 7.) and MCKI Frequency Select (See Table 12.)

FS3-0 bits select sampling frequency at PLL mode and MCKI frequency at EXT mode.

BCKP: BICK Polarity at DSP Mode (See Table 18)

"0": SDTO is output by the rising edge ("↑") of BICK and SDTI is latched by the falling edge ("↓"). (Default)

"1": SDTO is output by the falling edge ("↓") of BICK and SDTI is latched by the rising edge ("↑").

MSBS: LRCK Polarity at DSP Mode (See Table 18)

"0": The rising edge ("↑") of LRCK is half clock of BICK before the channel change. (Default)

"1": The rising edge ("↑") of LRCK is one clock of BICK before the channel change.

PS1-0: MCKO Output Frequency Select (See Table 10)

Default: "00"(256fs)

| Addr | Register Name | D7   | D6   | D5   | D4   | D3   | D2   | D1    | D0    |
|------|---------------|------|------|------|------|------|------|-------|-------|
| 06H  | Timer Select  | DVTM | WTM2 | ZTM1 | ZTM0 | WTM1 | WTM0 | RFST1 | RFST0 |
|      | Default       | 0    | 0    | 0    | 0    | 0    | 0    | 0     | 0     |

RFST1-0: ALC First recovery Speed (See Table 30)

Default: "00"(4times)

WTM2-0: ALC Recovery Waiting Period (See Table 27.)

Default: "000" (128/fs)

ZTM1-0: ALC Limiter/Recovery Operation Zero Crossing Timeout Period (See Table 26.)

Default: "00" (128/fs)

DVTM: Digital Volume Transition Time Setting (See Table 36.)

0: 1061/fs (Default)

1: 256/fs

This is the transition time between DVL/R7-0 bits = 00H and FFH.

| Addr | Register Name      | D7 | D6 | D5  | D4    | D3    | D2    | D1     | D0    |
|------|--------------------|----|----|-----|-------|-------|-------|--------|-------|
| 07H  | ALC Mode Control 1 | 0  | 0  | ALC | ZELMN | LMAT1 | LMAT0 | RGAIN0 | LMTH0 |
|      | Default            | 0  | 0  | 0   | 0     | 0     | 0     | 0      | 0     |

LMTH1-0: ALC Limiter Detection Level / Recovery Counter Reset Level (See Table 24.)

Default: "00"

LMTH1 bit is D6 bit of 0BH.

RGAIN1-0: ALC Recovery GAIN Step (See Table 28.)

Default: "00"

RGAIN1 bit is D7 bit of 0BH.

LMAT1-0: ALC Limiter ATT Step (See Table 25.)

Default: "00"

ZELMN: Zero Crossing Detection Enable at ALC Limiter Operation

0: Enable (Default)

1: Disable

ALC: ALC Enable

0: ALC Disable (Default)

1: ALC Enable

| Addr | Register Name      | D7   | D6   | D5   | D4   | D3   | D2   | D1   | D0   |
|------|--------------------|------|------|------|------|------|------|------|------|
| 08H  | ALC Mode Control 2 | REF7 | REF6 | REF5 | REF4 | REF3 | REF2 | REF1 | REF0 |
|      | Default            | 1    | 1    | 1    | 0    | 0    | 0    | 0    | 1    |

REF7-0: Reference Value at ALC Recovery Operation. 0.375dB step, 242 Level (See Table 29.)

Default: "E1H" (+30.0dB)

| Addr    | Register Name            | D7   | D6   | D5   | D4   | D3   | D2   | D1   | D0   |
|---------|--------------------------|------|------|------|------|------|------|------|------|
| 09H     | Lch Input Volume Control | AVL7 | AVL6 | AVL5 | AVL4 | AVL3 | AVL2 | AVL1 | AVL0 |
| 0CH     | Rch Input Volume Control | AVR7 | AVR6 | AVR5 | AVR4 | AVR3 | AVR2 | AVR1 | AVR0 |
| Default |                          | 1    | 1    | 1    | 0    | 0    | 0    | 0    | 1    |

AVL7-0, AVR7-0: ALC Block Digital Volume; 0.375dB step, 242 Level (See Table 32.)

Default: "E1H" (+30.0dB)

| Addr    | Register Name              | D7   | D6   | D5   | D4   | D3   | D2   | D1   | D0   |
|---------|----------------------------|------|------|------|------|------|------|------|------|
| 0AH     | Lch Digital Volume Control | DVL7 | DVL6 | DVL5 | DVL4 | DVL3 | DVL2 | DVL1 | DVL0 |
| 0DH     | Rch Digital Volume Control | DVR7 | DVR6 | DVR5 | DVR4 | DVR3 | DVR2 | DVR1 | DVR0 |
| Default |                            | 0    | 0    | 0    | 1    | 1    | 0    | 0    | 0    |

DVL7-0, DVR7-0: Output Digital Volume (See Table 35.)

Default: "18H" (0dB)

| Addr    | Register Name      | D7     | D6    | D5 | D4 | D3 | D2 | D1   | D0 |
|---------|--------------------|--------|-------|----|----|----|----|------|----|
| 0BH     | ALC Mode Control 3 | RGAIN1 | LMTH1 | 0  | 0  | 0  | 0  | VBAT | 0  |
| Default |                    | 0      | 0     | 0  | 0  | 0  | 0  | 0    | 0  |

VBAT: HP-Amp Common Voltage (See Table 51.)

0: 0.5 x HVDD (Default)

1: 0.64 x AVDD

LMTH1: ALC Limiter Detection Level / Recovery Counter Reset Level (See Table 24.)

RGAIN1: ALC Recovery GAIN Step (See Table 28.)

| Addr    | Register Name  | D7 | D6   | D5    | D4    | D3   | D2   | D1   | D0   |
|---------|----------------|----|------|-------|-------|------|------|------|------|
| 0EH     | Mode Control 3 | 0  | LOOP | SMUTE | DVOLC | BST1 | BST0 | DEM1 | DEM0 |
| Default |                | 0  | 0    | 0     | 1     | 0    | 0    | 0    | 1    |

DEM1-0: De-emphasis Frequency Select (See Table 33)

Default: "01" (OFF)

BST1-0: Bass Boost Function Select (See Table 34)

Default: "00" (OFF)

DVOLC: Output Digital Volume Control Mode Select

0: Independent

1: Dependent (Default)

When DVOLC bit = "1", DVL7-0 bits control both Lch and Rch volume level, while register values of DVL7-0 bits are not written to DVR7-0 bits. When DVOLC bit = "0", DVL7-0 bits control Lch level and DVR7-0 bits control Rch level, respectively.

SMUTE: Soft Mute Control

0: Normal Operation (Default)

1: DAC outputs soft-muted

LOOP: Digital Loopback Mode

0: SDTI → DAC (Default)

1: SDTO → DAC

| Addr | Register Name  | D7 | D6 | D5 | D4 | D3    | D2  | D1   | D0   |
|------|----------------|----|----|----|----|-------|-----|------|------|
| 0FH  | Mode Control 4 | 0  | 0  | 0  | 0  | AVOLC | HPM | MINH | DACH |
|      | Default        | 0  | 0  | 0  | 0  | 1     | 0   | 0    | 0    |

DACH: Switch Control from DAC to Headphone-Amp

0: OFF (Default)

1: ON

MINH: Switch Control from MIN pin to Headphone-Amp

0: OFF (Default)

1: ON

HPM: Headphone-Amp Mono Output Select

0: Stereo (Default)

1: Mono

When the HPM bit = "1", DAC output signal is output to Lch and Rch of the Headphone-Amp as (L+R)/2.

AVOLC: ALC Block Digital Volume Control Mode Select

0: Independent

1: Dependent (Default)

When AVOLC bit = "1", AVL7-0 bits control both Lch and Rch volume level, while register values of AVL7-0 bits are not written to AVR7-0 bits. When AVOLC bit = "0", AVL7-0 bits control Lch level and AVR7-0 bits control Rch level, respectively.

| Addr | Register Name      | D7   | D6   | D5  | D4    | D3    | D2   | D1   | D0 |
|------|--------------------|------|------|-----|-------|-------|------|------|----|
| 10H  | Power Management 3 | INR1 | INL1 | HPG | MDIF2 | MDIF1 | INR0 | INL0 | 0  |
|      | Default            | 0    | 0    | 0   | 0     | 0     | 0    | 0    | 0  |

INL1-0: Gain-Amp Lch Input Source Select

Default: 00 (LIN1 pin)

INR1-0: Gain-Amp Rch Input Source Select

Default: 00 (RIN1 pin)

MDIF1: Single-ended / Full-differential Input Select 1

0: Single-ended input (LIN1/RIN1 pins: Default)

1: Full-differential input (IN1+/IN1- pins)

MDIF1 bit selects the input type of pins #32 and #31.

MDIF2: Single-ended / Full-differential Input Select 2

0: Single-ended input (LIN2/RIN2 pins: Default)

1: Full-differential input (IN2+/IN2- pins)

MDIF2 bit selects the input type of pins #30 and #29.

HPG: Headphone-Amp Gain Select (See Table 49.)

0: 0dB (Default)

1: +3.6dB

| Addr | Register Name         | D7  | D6  | D5 | D4   | D3 | D2   | D1 | D0 |
|------|-----------------------|-----|-----|----|------|----|------|----|----|
| 11H  | Digital Filter Select | GN1 | GN0 | 0  | FIL1 | EQ | FIL3 | 0  | 0  |
|      | Default               | 0   | 0   | 0  | 0    | 0  | 0    | 0  | 0  |

GN1-0: Gain Select at GAIN block (See Table 23.)

Default: "00"

FIL3: FIL3 (Stereo Separation Emphasis Filter) Coefficient Setting Enable

0: Disable (Default)

1: Enable

When FIL3 bit is "1", the settings of F3A13-0 and F3B13-0 bits are enabled. When FIL3 bit is "0", FIL3 block is OFF (MUTE).

EQ: EQ (Gain Compensation Filter) Coefficient Setting Enable

0: Disable (Default)

1: Enable

When EQ bit is "1", the settings of EQA15-0, EQB13-0 and EQC15-0 bits are enabled. When EQ bit is "0", EQ block is through (0dB).

FIL1: FIL1 (Wind-noise Reduction Filter) Coefficient Setting Enable

0: Disable (Default)

1: Enable

When FIL1 bit is "1", the settings of F1A13-0 and F1B13-0 bits are enabled. When FIL1 bit is "0", FIL1 block is through (0dB).

| Addr    | Register Name       | D7    | D6    | D5    | D4    | D3    | D2    | D1   | D0   |

**SYSTEM DESIGN**

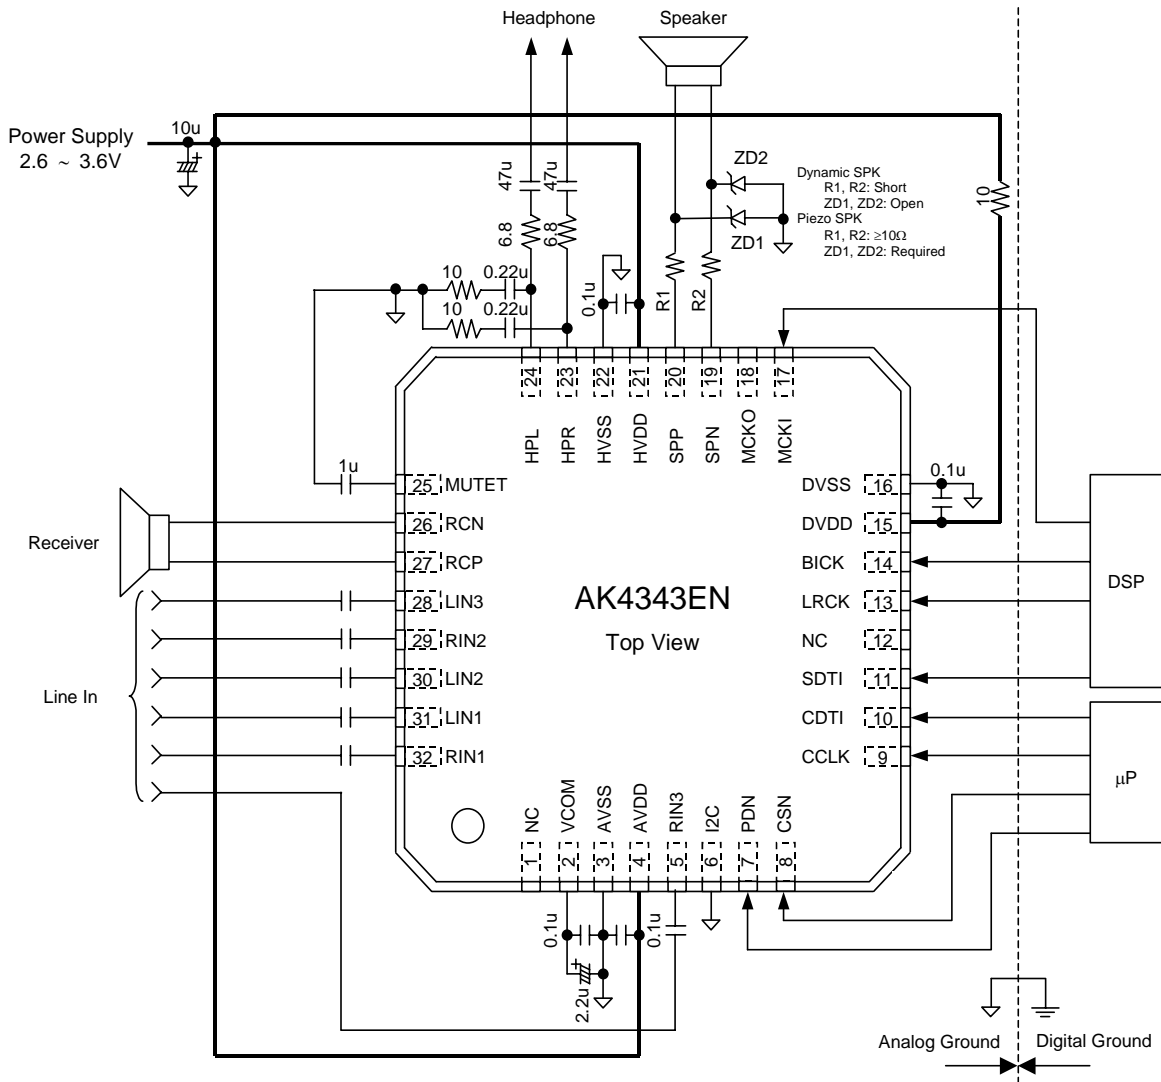

Figure 72 and Figure 73 shows the system connection diagram for the AK4343. An evaluation board [AKD4343] is available which demonstrates the optimum layout, power supply arrangements and measurement results.

**Notes:**

- AVSS, DVSS and HVSS of the AK4343 should be distributed separately from the ground of external controllers.
- All digital input pins should not be left floating.
- When the AK4343 is EXT mode (PMPLL bit = "0"), a resistor and capacitor of VCOC pin is not needed.
- When the AK4343 is PLL mode (PMPLL bit = "1"), a resistor and capacitor of VCOC pin is shown in Table 5.
- When piezo speaker is used, 2.6 ~ 5.25V power should be supplied to HVDD and 10Ω or more series resistors should be connected to both SPP and SPN pins, respectively.
- When the AK4343 is used at master mode, LRCK and BICK pins are floating before M/S bit is changed to "1". Therefore, 100kΩ around pull-up resistor should be connected to LRCK and BICK pins of the AK4343.

Figure 72. Typical Connection Diagram (AIN3 bit = "0", Line Input)

Notes:

- AVSS, DVSS and HVSS of the AK4343 should be distributed separately from the ground of external controllers.
- All digital input pins should not be left floating.
- When AIN3 bit = "1", PLL is not available.
- When piezo speaker is used, 2.6 ~ 5.25V power should be supplied to HVDD and 10Ω or more series resistors should be connected to both SPP and SPN pins, respectively.

Figure 73. Typical Connection Diagram (AIN3 bit = "1": PLL is not available, RCV bit = "1", Line Input)

## 1. Grounding and Power Supply Decoupling

The AK4343 requires careful attention to power supply and grounding arrangements. AVDD, DVDD and HVDD are usually supplied from the system's analog supply. If AVDD, DVDD and HVDD are supplied separately, the power-up sequence is not critical. AVSS, DVSS and HVSS of the AK4343 should be connected to the analog ground plane. System analog ground and digital ground should be connected together near to where the supplies are brought onto the printed circuit board. Decoupling capacitors should be as near to the AK4343 as possible, with the small value ceramic capacitor being the nearest.

## 2. Voltage Reference

VCOM is a signal ground of this chip. A 2.2 $\mu$ F electrolytic capacitor in parallel with a 0.1 $\mu$ F ceramic capacitor attached to the VCOM pin eliminates the effects of high frequency noise. No load current may be drawn from the VCOM pin. All signals, especially clocks, should be kept away from the VCOM pin in order to avoid unwanted coupling into the AK4343.

## 3. Analog Inputs

The Line and MIN inputs are single-ended. The input signal range scales with nominally at 0.06 x AVDD Vpp(typ) @MGAIN1-0 bits = "01", 0.03 x AVDD Vpp(typ) @MGAIN1-0 bits = "10", 0.015 x AVDD Vpp(typ) @MGAIN1-0 bits = "11" or 0.6 x AVDD Vpp(typ) @MGAIN1-0 bits = "00" for the Line input and 0.6 x AVDD Vpp (typ) for the MIN input, centered around the internal common voltage (0.45 x AVDD). Usually the input signal is AC coupled using a capacitor. The cut-off frequency is  $f_c = (1/2\pi RC)$ . The AK4343 can accept input voltages from AVSS to AVDD.

## 4. Analog Outputs

The input data format for the DAC is 2's complement. The output voltage is a positive full scale for 7FFFH(@ 16bit) and a negative full scale for 8000H(@ 16bit). Stereo Line Output and Receiver Output are centered at 0.45 x AVDD. The Headphone-Amp and Speaker-Amp outputs are centered at HVDD/2.

## CONTROL SEQUENCE

### ■ Clock Set up

When DAC is powered-up, the clocks must be supplied.

#### 1. PLL Master Mode.

Figure 74. Clock Set Up Sequence (1)

#### <Example>

- (1) After Power Up, PDN pin = "L" → "H"  
 "L" time of 150ns or more is needed to reset the AK4343.
- (2) DIF1-0, PLL3-0, FS3-0, BCKO and M/S bits should be set during this period.
- (3) Power Up VCOM: PMVCM bit = "0" → "1"  
 VCOM should first be powered-up before the other block operates.
- (4) In case of using MCKO output: MCKO bit = "1"  
 In case of not using MCKO output: MCKO bit = "0"
- (5) PLL lock time is 40ms(max) after PMPLL bit changes from "0" to "1" and MCKI is supplied from an external source.
- (6) The AK4343 starts to output the LRCK and BICK clocks after the PLL becomes stable. Then normal operation starts.
- (7) The invalid frequency is output from MCKO pin during this period if MCKO bit = "1".
- (8) The normal clock is output from MCKO pin after the PLL is locked if MCKO bit = "1".

2. PLL Slave Mode (LRCK or BICK pin)

Figure 75. Clock Set Up Sequence (2)

<Example>

- (2) After Power Up: PDN pin "L" → "H"  
 "L" time of 150ns or more is needed to reset the AK4343.
- (3) DIF1-0, FS3-0 and PLL3-0 bits should be set during this period.
- (4) Power Up VCOM: PMVCM bit = "0" → "1"  
 VCOM should first be powered up before the other block operates.
- (5) PLL starts after the PMPLL bit changes from "0" to "1" and PLL reference clock (LRCK or BICK pin) is supplied. PLL lock time is 160ms(max) when LRCK is a PLL reference clock. And PLL lock time is 2ms(max) when BICK is a PLL reference clock.
- (6) Normal operation starts after that the PLL is locked.

3. PLL Slave Mode (MCKI pin)

Example:

Audio I/F Format: MSB justified  
 Input Master Clock Select at PLL Mode: 11.2896MHz  
 MCKO: Enable  
 Sampling Frequency: 44.1kHz

Figure 76. Clock Set Up Sequence (3)

<Example>

- (1) After Power Up: PDN pin “L” → “H”  
 “L” time of 150ns or more is needed to reset the AK4343.
- (2) DIF1-0, PLL3-0 and FS3-0 bits should be set during this period.
- (3) Power Up VCOM: PMVCM bit = “0” → “1”  
 VCOM should first be powered up before the other block operates.
- (4) Enable MCKO output: MCKO bit = “1”
- (5) PLL starts after that the PMPLL bit changes from “0” to “1” and PLL reference clock (MCKI pin) is supplied.  
 PLL lock time is 40ms(max).
- (6) The normal clock is output from MCKO after PLL is locked.
- (7) The invalid frequency is output from MCKO during this period.
- (8) BICK and LRCK clocks should be synchronized with MCKO clock.

4. EXT Slave Mode

Figure 77. Clock Set Up Sequence (4)

<Example>

- (1) After Power Up: PDN pin “L” → “H”  
 “L” time of 150ns or more is needed to reset the AK4343.
- (2) DIF1-0 and FS1-0 bits should be set during this period.
- (3) Power Up VCOM: PMVCM bit = “0” → “1”  
 VCOM should first be powered up before the other block operates.
- (4) Normal operation starts after the MCKI, LRCK and BICK are supplied.

5. EXT Master Mode

Figure 78. Clock Set Up Sequence (5)

<Example>

- (1) After Power Up: PDN pin “L” → “H”  
 “L” time of 150ns or more is needed to reset the AK4343.
- (2) MCKI should be input.
- (3) After DIF1-0 and FS1-0 bits are set, M/S bit should be set to “1”. Then LRCK and BICK are output.
- (4) Power Up VCOM: PMVCM bit = “0” → “1”  
 VCOM should first be powered up before the other block operates.

■ Speaker-amp Output

Figure 79. Speaker-Amp Output Sequence

<Example>

At first, clocks should be supplied according to “Clock Set Up” sequence.

- (1) Set up a sampling frequency (FS3-0 bits). When the AK4343 is PLL mode, DAC and Speaker-Amp should be powered-up in consideration of PLL lock time after a sampling frequency is changed.
- (2) Set up the path of “DAC → SPK-Amp”: DACS bit = “0” → “1”
- (3) SPK-Amp gain setting: SPKG1-0 bits = “00” → “01”
- (4) Set up Timer Select for ALC (Addr: 06H)
- (5) Set up REF value for ALC (Addr: 08H)
- (6) Set up LMTH1 and RGAIN1 bits (Addr: 0BH)
- (7) Set up LMTH0, RGAIN0, LMAT1-0 and ALC bits (Addr: 07H)
- (8) Set up the ALC Block Digital Volume (Addr: 09H and 0CH)  
 AVL7-0 and AVR7-0 bits should be set to “91H”(0dB).
- (9) Set up the output digital volume (Addr: 0AH and 0DH).  
 When DVOLC bit is “1” (default), DVL7-0 bits set the volume of both channels. After DAC is powered-up, the digital volume changes from default value (0dB) to the register setting value by the soft transition.
- (10) Power Up of DAC, MIN-Amp and Speaker-Amp: PMDAC = PMMIN = PMSPK bits = “0” → “1”  
 The DAC enters an initialization cycle that starts when the PMDAC bit is changed from “0” to “1”. The initialization cycle time is  $1059/fs=24ms@fs=44.1kHz$ . During the initialization cycle, the DAC input digital data of both channels are internally forced to a 2's compliment, “0”. The DAC output reflects the digital input data after the initialization cycle is complete. When ALC bit is “1”, ALC is disable (ALC gain is set by AVL/R7-0 bits) during an intialization cycle ( $1059/fs=24ms@fs=44.1kHz$ ). After the initialization cycle, ALC operation starts from the gain set by AVL/R7-0 bits.
- (11) Exit the power-save-mode of Speaker-Amp: SPPSN bit = “0” → “1”
- (12) Enter the power-save-mode of Speaker-Amp: SPPSN bit = “1” → “0”
- (13) Disable the path of “DAC → SPK-Amp”: DACS bit = “1” → “0”
- (14) Power Down DAC, MIN-Amp and Speaker-Amp: PMDAC = PMMIN = PMSPK bits = “1” → “0”

■ Mono signal output from Speaker-Amp

Figure 80. “MIN-Amp → Speaker-Amp” Output Sequence

<Example>

The clocks can be stopped when only MIN-Amp and Speaker-Amp are operating.

- (1) Power Up MIN-Amp and Speaker-Amp: PMMIN = PMSPK bits = “0” → “1”
- (2) Disable the path of “DAC → SPK-Amp”: DACS bit = “0”  
Enable the path of “MIN → SPK-Amp”: MINS bit = “0” → “1”
- (3) Exit the power-save-mode of Speaker-Amp: SPPSN bit = “0” → “1”
- (4) Enter the power-save-mode of Speaker-Amp: SPPSN bit = “1” → “0”
- (5) Power Down MIN-Amp and Speaker-Amp: PMMIN = PMSPK bits = “1” → “0”
- (6) Disable the path of “MIN → SPK-Amp”: MINS bit = “1” → “0”

## Headphone-amp Output

Figure 81. Headphone-Amp Output Sequence

### <Example>

At first, clocks should be supplied according to “Clock Set Up” sequence.

- (1) Set up a sampling frequency (FS3-0 bits). When the AK4343 is PLL mode, DAC and Speaker-Amp should be powered-up in consideration of PLL lock time after a sampling frequency is changed.
- (2) Set up the path of “DAC → HP-Amp”: DACH bit = “0” → “1”
- (3) Set up the low frequency boost level (BST1-0 bits)
- (4) Set up the ALC Block Digital Volume (Addr: 09H and 0CH)  
AVL7-0 and AVR7-0 bits should be set to “91H”(0dB).
- (5) Set up the output digital volume (Addr: 0AH and 0DH)  
When DVOLC bit is “1” (default), DVL7-0 bits set the volume of both channels. After DAC is powered-up, the digital volume changes from default value (0dB) to the register setting value by the soft transition.
- (6) Power up DAC and MIN-Amp: PMDAC = PMMIN bits = “0” → “1”  
The DAC enters an initialization cycle that starts when the PMDAC bit is changed from “0” to “1”. The initialization cycle time is  $1059/fs=24ms@fs=44.1kHz$ . During the initialization cycle, the DAC input digital data of both channels are internally forced to a 2's complement, “0”. The DAC output reflects the digital input data after the initialization cycle is complete. When ALC bit is “1”, ALC is disable (ALC gain is set by AVL/R7-0 bits) during an initialization cycle ( $1059/fs=24ms@fs=44.1kHz$ ). After the initialization cycle, ALC operation starts from the gain set by AVL/R7-0 bits.
- (7) Power up headphone-amp: PMHPL = PMHPR bits = “0” → “1”  
Output voltage of headphone-amp is still HVSS.
- (8) Rise up the common voltage of headphone-amp: HPMTN bit = “0” → “1”  
The rise time depends on HVDD and the capacitor value connected with the MUTET pin. When HVDD=3.3V and the capacitor value is 1.0 $\mu$ F, the time constant is  $\tau_r = 100ms$ (typ), 250ms(max).
- (9) Fall down the common voltage of headphone-amp: HPMTN bit = “1” → “0”  
The fall time depends on HVDD and the capacitor value connected with the MUTET pin. When HVDD=3.3V and the capacitor value is 1.0 $\mu$ F, the time constant is  $\tau_f = 100ms$ (typ), 250ms(max).  
If the power supply is powered-off or headphone-Amp is powered-down before the common voltage goes to GND, the pop noise occurs. It takes twice of  $\tau_f$  that the common voltage goes to GND.
- (10) Power down headphone-amp: PMHPL = PMHPR bits = “1” → “0”
- (11) Power down DAC and MIN-Amp: PMDAC = PMMIN bits = “1” → “0”
- (12) Off the bass boost: BST1-0 bits = “00”
- (13) Disable the path of “DAC → HP-Amp”: DACH bit = “1” → “0”

## ■ Stereo Line Output

Figure 82. Stereo Lineout Sequence

### <Example>

At first, clocks should be supplied according to "Clock Set Up" sequence.

- (1) Set up the sampling frequency (FS3-0 bits). When the AK4343 is PLL mode, DAC and Stereo Line-Amp should be powered-up in consideration of PLL lock time after the sampling frequency is changed.
- (2) Set up the path of "DAC → Stereo Line Amp": DACL bit = "0" → "1"
- (3) Set up the ALC Block Digital Volume (Addr: 09H and 0CH)  
AVL7-0 and AVR7-0 bits should be set to "91H"(0dB).
- (4) Set up the output digital volume (Addr: 0AH and 0DH)  
When DVOLC bit is "1" (default), DVL7-0 bits set the volume of both channels. After DAC is powered-up, the digital volume changes from default value (0dB) to the register setting value by the soft transition.
- (5) Enter power-save mode of Stereo Line Amp: LOPS bit = "0" → "1"
- (6) Power-up DAC, MIN-Amp and Stereo Line-Amp: PMDAC = PMMIN = PMLO bits = "0" → "1"  
The DAC enters an initialization cycle that starts when the PMDAC bit is changed from "0" to "1". The initialization cycle time is  $1059/fs=24ms@fs=44.1kHz$ . During the initialization cycle, the DAC input digital data of both channels are internally forced to a 2's complement, "0". The DAC output reflects the digital input data after the initialization cycle is complete. When ALC bit is "1", ALC is disable (ALC gain is set by AVL/R7-0 bits) during an initialization cycle ( $1059/fs=24ms@fs=44.1kHz$ ). After the initialization cycle, ALC operation starts from the gain set by AVL/R7-0 bits.  
LOUT and ROUT pins rise up to VCOM voltage after PMLO bit is changed to "1". Rise time is 300ms(max) at  $C=1\mu F$  and  $AVDD=3.3V$ .
- (7) Exit power-save mode of Stereo Line-Amp: LOPS bit = "1" → "0"  
LOPS bit should be set to "0" after LOUT and ROUT pins rise up. Stereo Line-Amp goes to normal operation by setting LOPS bit to "0".
- (8) Enter power-save mode of Stereo Line-Amp: LOPS bit: "0" → "1"
- (9) Power-down DAC, MIN-Amp and Stereo Line-Amp: PMDAC = PMMIN = PMLO bits = "1" → "0"  
LOUT and ROUT pins fall down to AVSS. Fall time is 300ms(max) at  $C=1\mu F$  and  $AVDD=3.3V$ .
- (10) Disable the path of "DAC → Stereo Line-Amp": DACL bit = "1" → "0"
- (11) Exit power-save mode of Stereo Line-Amp: LOPS bit = "1" → "0"  
LOPS bit should be set to "0" after LOUT and ROUT pins fall down.

■ Receiver-amp Output

Figure 83. Speaker-Amp Output Sequence

<Example>

At first, clocks should be supplied according to "Clock Set Up" sequence.

- (1) Set up a sampling frequency (FS3-0 bits). When the AK4343 is PLL mode, DAC and Receiver-Amp should be powered-up in consideration of PLL lock time after a sampling frequency is changed.
- (2) Set up the path of "DAC → RCV-Amp and Power-save mode": DACL=LOPS bit = "0" → "1"
- (3) Set up the ALC Block Digital Volume (Addr: 09H and 0CH)  
AVL7-0 and AVR7-0 bits should be set to "91H"(0dB).
- (4) Set up the output digital volume (Addr: 0AH and 0DH).  
When DVOLC bit is "1" (default), DVL7-0 bits set the volume of both channels. After DAC is powered-up, the digital volume changes from default value (0dB) to the register setting value by the soft transition.
- (5) Power Up of DAC, MIN-Amp and Receiver-Amp: PMDAC = PMMIN = PMLO bits = "0" → "1"  
The DAC enters an initialization cycle that starts when the PMDAC bit is changed from "0" to "1". The initialization cycle time is 1059/fs=24ms@fs=44.1kHz. During the initialization cycle, the DAC input digital data of both channels are internally forced to a 2's compliment, "0". The DAC output reflects the digital input data after the initialization cycle (1059/fs=24ms@fs=44.1kHz) is complete.
- (6) Exit the power-save-mode of Receiver-Amp: LOPS bit = "1" → "0"
- (7) Enter the power-save-mode of Receiver-Amp: LOPS bit = "0" → "1"
- (8) Disable the path of "DAC → RCV-Amp": DACL bit = "1" → "0"
- (9) Power Down DAC, MIN-Amp and Receiver-Amp: PMDAC = PMMIN = PMLO bits = "1" → "0"

■ Stop of Clock

Master clock can be stopped when DAC is not used.

1. PLL Master Mode

Figure 84. Clock Stopping Sequence (1)

<Example>

- (1) Power down PLL: PMPLL bit = "1" → "0"
- (2) Stop MCKO clock: MCKO bit = "1" → "0"
- (3) Stop an external master clock.

2. PLL Slave Mode (LRCK or BICK pin)

Figure 85. Clock Stopping Sequence (2)

<Example>

- (1) Power down PLL: PMPLL bit = "1" → "0"
- (2) Stop the external BICK and LRCK clocks

3. PLL Slave (MCKI pin)

Figure 86. Clock Stopping Sequence (3)

<Example>

- (1) Power down PLL: PMPLL bit = "1" → "0"  
Stop MCKO output: MCKO bit = "1" → "0"
- (2) Stop the external master clock.

4. EXT Slave Mode

Figure 87. Clock Stopping Sequence (4)

<Example>

(1) Stop the external MCKI, BICK and LRCK clocks.

5. EXT Master Mode

Figure 88. Clock Stopping Sequence (5)

<Example>

(1) Stop MCKI clock. BICK and LRCK are fixed to "H" or "L".

■ Power down

Power supply current can be shut down (typ. 10μA) by stopping clocks and setting PMVCM bit = "0" after all blocks except for VCOM are powered-down. Power supply current can be also shut down (typ. 10μA) by stopping clocks and setting PDN pin = "L". When PDN pin = "L", the registers are initialized.

PACKAGE

● 32pin QFN (Unit: mm)

Note) The exposed pad on the bottom surface of the package must be open or connected to the ground.

■ Material & Lead finish

### IMPORTANT NOTICE

- These products and their specifications are subject to change without notice. Before considering any use or application, consult the Asahi Kasei Microsystems Co., Ltd. (AKM) sales office or authorized distributor concerning their current status.
- AKM assumes no liability for infringement of any patent, intellectual property, or other right in the application or use of any information contained herein.
- Any export of these products, or devices or systems containing them, may require an export license or other official approval under the law and regulations of the country of export pertaining to customs and tariffs, currency exchange, or strategic materials.
- AKM products are neither intended nor authorized for use as critical components in any safety, life support, or other hazard related device or system, and AKM assumes no responsibility relating to any such use, except with the express written consent of the Representative Director of AKM. As used here:
  - a. A hazard related device or system is one designed or intended for life support or maintenance of safety or for applications in medicine, aerospace, nuclear energy, or other fields, in which its failure to function or perform may reasonably be expected to result in loss of life or in significant injury or damage to person or property.
  - b. A critical component is one whose failure to function or perform may reasonably be expected to result, whether directly or indirectly, in the loss of the safety or effectiveness of the device or system containing it, and which must therefore meet very high standards of performance and reliability.
- It is the responsibility of the buyer or distributor of an AKM product who distributes, disposes of, or otherwise places the product with a third party to notify that party in advance of the above content and conditions, and the buyer or distributor agrees to assume any and all responsibility and liability for and hold AKM harmless from any and all claims arising from the use of said product in the absence of such notification.
