SJF	80	12.5	1562	1000	812

Note :

1. θ_{JA}: Thermal Resistance-Junction to Ambient, D_F : Derating factor, Po: Power consumption.
   Junction Temperature Calculation: $T_J = T_A + (P_D \times \theta_{JA})$, $Po = D_F \times (T_J - T_A)$
   The θ_{JA} numbers are guidelines for the thermal performance of the device/PC-board system.
   All of the above assume no ambient airflow.

2. θ_{JT}: Thermal Resistance-Junction to Tab, T_C: case(Tab) temperature, $T_J = T_C + (P_D \times \theta_{JT})$
   For SK package, $\theta_{JT} = 15.0^oC$ /W.
   For SJ package, $\theta_{JT} = 7.0^oC$ /W.

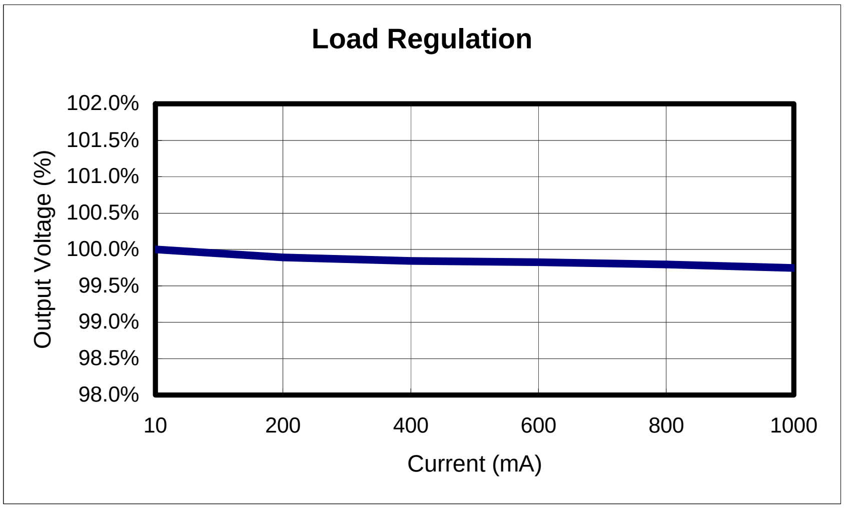
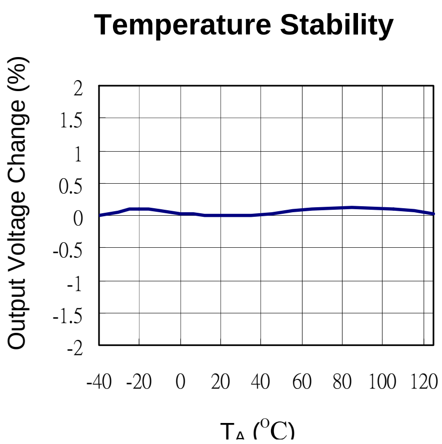
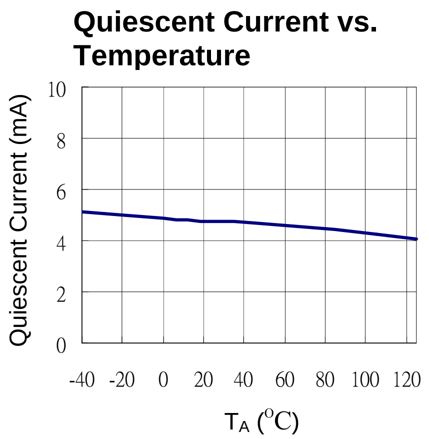
CHARACTERIZATION CURVES

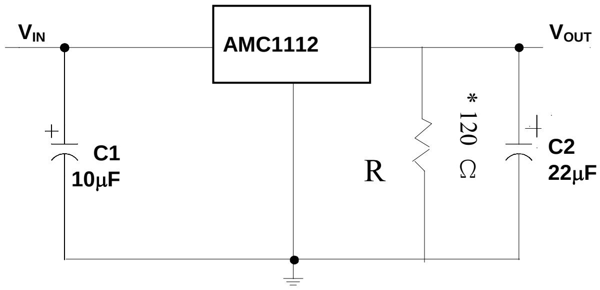
Unless otherwise specified, $V_{IN}= V_{OUT}+2V$，$C_{IN}=1\mu F$，$C_{OUT}=4.7\mu F$，$T_A=25^oC$







APPLICATION INFORMATION



Note: 1. *120Ω for warrant work on 10mA.

2. R doesn't need to use if load more than 120Ω.

Fixed Voltage Regulator

Application Note:

Maximum Power Calculation:

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_{A(MAX)}}{\theta_{JA}}$$

T_J(°C): Maximum recommended junction temperature

T_A(°C): Ambient temperature of the application

θ_{JA}(°C/W): Junction-to-junction temperature thermal resistance of the package, and other heat dissipating materials.

The maximum power dissipation of a single-output regulator :

$P_{D(MAX)} = [(V_{IN(MAX)} - V_{OUT(NOM)})] \times I_{OUT(NOM)} + V_{IN(MAX)} \times I_Q$

Where: $V_{OUT(NOM)}$ = the nominal output voltage
$I_{OUT(NOM)}$ = the nominal output current, and
I_Q = the quiescent current the regulator consumes at $I_{OUT(MAX)}$
$V_{IN(MAX)}$ = the maximum input voltage

Then $\theta_{JA} = (150\,^{o}C - T_A) / P_D$

Thermal consideration:

When power consumption is over about 404 mW (for SOT-223 package, 687mW for TO-252 package, at T_A=70 °C), additional heat sink is required to control the junction temperature below 125 °C.

The junction temperature is: $T_J = P_D\ (\theta_{JT} + \theta_{CS} + \theta_{SA}) + T_A$

P_D.:Dissipated power.

θ_{JT}.:Thermal resistance from the junction to the mounting tab of the package.

θ_{CS}.:Thermal resistance through the interface between the IC and the surface on which it is mounted. (typically, $\theta_{CS} < 1.0$°C/W)

θ_{SA} : Thermal resistance from the mounting surface to ambient (thermal resistance of the heat sink).

If PC Board copper is going to be used as a heat sink, below table can be used to determine the appropriate size of copper foil required. For multi-layered PCB, these layers can also be used as a heat sink. They can be connected with several through hole vias.

PCB θ_{SA} (°C /W)	59	45	38	33	27	24	21
PCB heat sink size (mm^2)	500	1000	1500	2000	3000	4000	5000

Recommended figure of PCB area used as a heat sink.
