

**150mA RF ULDO REGULATOR**

**AP2201**

**General Description**

The AP2201 is a 150mA output current fixed voltage regulator designed to provide very low noise (45µVrms at 80Hz-100KHz), ultra low dropout voltage (typically 165mV at 150mA), very low quiescent current (1µA maximum) and excellent power supply ripple rejection (PSRR 75dB at 100Hz) in battery powered applications, such as handsets and PDAs and in noise sensitive applications, such as RF electronics.

The AP2201 also features individual logic compatible enable/shutdown control inputs, a low power shutdown mode for extended battery life, over current protection, over temperature protection, as well as reversed-battery protection.

The output capacitor of 1.0µF minimum and 2.2µF minimum near its pin are recommended when C<sub>BYP</sub> is not used and when C<sub>BYP</sub> is 470pF respectively. The output capacitor should have 5Ω or less ESR, tantalum or aluminium electrolytic capacitors are adequate. Bypass capacitor is connected to the internal voltage reference to quiet noise. Its recommended value is from 470pF to 1nF. If output noise is not a major concern and rapid turn-on is necessary, omit C<sub>BYP</sub> and leave BYP open.

The AP2201 has 2.6V, 2.8V and 3.0V versions now.

The AP2201 is available in space saving 5-pin SOT-23-5 package.

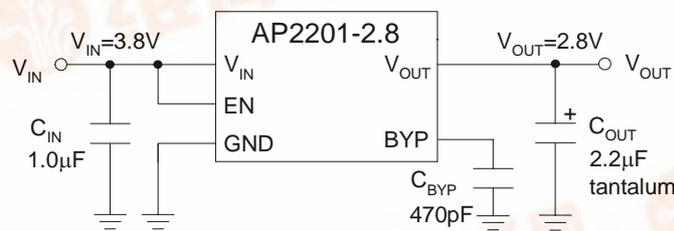

Figure 1. Typical Application of AP2201

**Features**

- Up to 150mA Regulator Output
- Low Quiescent Current
- Low Dropout Voltage: V<sub>D</sub>=165mV at 150mA
- High Precision Output Voltage: ±1%
- Output Noise: 45µVrms at 80Hz-100KHz
- Good Ripple Rejection Ability: 75dB at 100Hz and I<sub>OUT</sub>=100µA
- Tight Load and Line Regulation
- Low Temperature Coefficient
- Over Current Protection
- Thermal Protection
- Reverse-battery Protection
- Zero Off-mode Current
- Logic-controlled Enable

**Applications**

- Cellular Phones
- Cordless Phones
- Digital Still Cameras
- Wireless Communicators
- PDAs / Palmtops
- PC Mother Board
- Consumer Electronics

**Ordering Information**

**150mA RF ULDO REGULATOR****AP2201****Ordering Information (Continued)**

Package	Temperature Range	Part Number		Marking ID		Packing Type
		Tin Lead	Lead Free	Tin Lead	Lead Free	
SOT-23-5	-40 to 125°C	AP2201K-2.6TR	AP2201K-2.6TRE1	K1E	E1E	Tape & Reel
		AP2201K-2.8TR	AP2201K-2.8TRE1	K1G	E1G	Tape & Reel
		AP2201K-3.0TR	AP2201K-3.0TRE1	K1I	E1I	Tape & Reel

BCD Semiconductor's Pb-free products, as designated with "E1" suffix in the part number, are RoHS compliant.

**Absolute Maximum Ratings (Note 1)**

Parameter	Symbol	Value	Unit
Supply Input Voltage	$V_{IN}$	15	V
Enable Input Voltage	$V_{EN}$	15	V
Power Dissipation	$P_D$	Internally Limited	W
Lead Temperature (Soldering, 5sec)	$T_{LEAD}$	260	°C
Storage Temperature	$T_{STG}$	-65 to 150	°C
ESD (Machine Model)		200	V
Thermal Resistance	$\theta_{JA}$	(Note 2)	

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

Note 2: Absolute maximum ratings indicate limits beyond which damage to the component may occur. Electrical specifications do not apply when operating the device outside of its operating ratings. The maximum allowable power dissipation is a function of the maximum junction temperature,  $T_{J(max)}$ , the junction-to-ambient thermal resistance,  $\theta_{JA}$ , and the ambient temperature,  $T_A$ . The maximum allowable power dissipation at any ambient temperature is calculated using:  $P_{D(max)} = (T_{J(max)} - T_A) / \theta_{JA}$ . Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown.

**Recommended Operating Conditions**

Parameter	Symbol	Min	Max	Unit
Supply Input Voltage	$V_{IN}$	2.5	13.2	V
Enable Input Voltage	$V_{EN}$	0	13.2	V
Operating Junction Temperature	$T_J$	-40	125	°C

Enable Input Logic-Low Voltage	$V_{IL}$	Regulator shutdown			0.4	V
					<b>0.18</b>	
Enable Input Logic-High Voltage	$V_{IH}$	Regulator enabled	<b>2.0</b>			V
Enable Input Logic-Low Current	$I_{IL}$	$V_{IL} \leq 0.4V$		0.01	-1	$\mu A$
		$V_{IL} \leq 0.18V$			<b>-2</b>	
Enable Input Logic-High Current	$I_{IH}$	$V_{IL} \geq 2.0V$		5	20	$\mu A$
		$V_{IL} \geq 2.0V$			<b>25</b>	

Note 3: Output voltage temperature coefficient is defined as the worst case voltage change divided by the total temperature range.

Note 4: Regulation is measured at constant junction temperature using low duty cycle pulse testing. Parts are tested for load regulation in the load range from 0.1mA to 150mA. Changes in output voltage due to heating effects are covered by the thermal regulation specification.

Note 5: Dropout voltage is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at 1V differential.

Note 6: Ground pin current is the regulator quiescent current plus pass transistor base current. The total current drawn from the supply is the sum of the load current plus the ground pin current.

**150mA RF ULDO REGULATOR****AP2201****Application Information****External Capacitors**

The AP2201 requires external capacitors for regulator stability. These capacitors must be correctly selected for good performance.

**Input Capacitor**

If there is more than 10 inches of wire between the input and the AC filter or if a battery is used as the input, at least a  $1\mu\text{F}$  capacitor should be placed from IN to GND.

**Output Capacitor**

It is required to prevent oscillation.  $1.0\mu\text{F}$  minimum is recommended when  $C_{\text{BYP}}$  is not used.  $2.2\mu\text{F}$  minimum is recommended when  $C_{\text{BYP}}$  is  $470\text{pF}$ . The output capacitor may be increased without limit for large values to improve transient response.

The output capacitor should have an ESR of about  $5\Omega$  or less. In most cases, tantalum or aluminium electrolytic capacitors are adequate.

**Noise Bypass Capacitor**

Bypass capacitor is connected to the internal voltage reference. A  $680\text{pF}$  capacitor connected from BYP to GND make this reference quiet, resulting in a significant reduction in output noise. When using  $C_{\text{BYP}}$  output capacitors of  $2.2\mu\text{F}$  or greater are required for better stability.

The start-up speed of the AP2201 is inversely proportional to the value of reference bypass capacitor. In some cases if output noise is not a major concern and rapid turn-on is necessary, omit  $C_{\text{BYP}}$  and leave BYP open.
