

APA2057A

2.4W Stereo Audio Power Amplifier (with Gain Setting) & Capfree Headphone Driver

Features

- **Operating Voltage**
 - HV_{DD}=3.0~3.6V
 - V_{DD}=4.5~5.5V
- **No Output Capacitor at Headphone Amplifier Required**
- **Meeting VISTA Requirement**
- **Low Distortion**
 - AMP mode**
 - THD+N=56dB, at V_{DD}=5V, R_L=4W, P_o=1.5W
 - THD+N=64dB, at V_{DD}=5V, R_L=8W, P_o=0.9W
 - HP mode**
 - THD+N=73dB, at HV_{DD}=3.3V, R_L=16W
P_o=125mW
 - THD+N=77dB, at HV_{DD}=3.3V, R_L=32W,
P_o=88mW
 - THD+N=85dB, at HV_{DD}=3.3V, R_L=10kW,
V_o=1.7Vrms
- **Output Power at 1% THD+N**
 - 1.9W, at V_{DD}=5V, AMP mode, R_L=4W
 - 1.2W, at V_{DD}=5V, AMP mode, R_L=8W
- **at 10% THD+N**
 - 2.4W at V_{DD}=5V, AMP mode, R_L=4W
 - 1.5W at V_{DD}=5V, AMP mode, R_L=8W
- **Depop Circuitry Integrated**
- **Internal 19-steps Gain Setting for Flexible Application**
- **Thermal Shutdown Protection and Over Current Protection Circuitry**
- **High Supply Voltage Ripple Rejection**
- **Surface-Mount Packaging**
 - TSSOP-28P (with enhanced thermal pad)
 - TQFN5x5-28 (with enhanced thermal pad)
- **Lead Free Available (RoHS Compliant)**

General Description

The APA2057A is a monolithic integrated circuit, which combines a stereo power amplifier and a stereo output capacitor-less headphone amplifier. The stereo power amplifier provides 19-steps gain setting for flexible application. The headphone amplifier is ground-reference output, and no need the output capacitors for DC blocking. The advantages of eliminating the output capacitor are saving the cost, PCB's space and component height.

Both the de-pop circuitry and the thermal shutdown protection circuitry are integrated in the APA2057A, which reduces pops and clicks noise during power on/off and in shutdown mode. Thermal shutdown protects the chip from being destroyed by over-temperature failure. To simplify the audio system design in notebook computer applications, the APA2057A provides the internal gain setting, and these features can minimize components and PCB area.

The APA2057A is available in both TSSOP-28P and TQFN5x5-28 packages. Both packages are characterized by space saving and thermal efficiency.

Applications

- Note book PCs
- LCD monitor

ANPEC reserves the right to make changes to improve reliability or manufacturability without notice, and advise customers to obtain the latest version of relevant information to verify before placing orders.

APA2057A

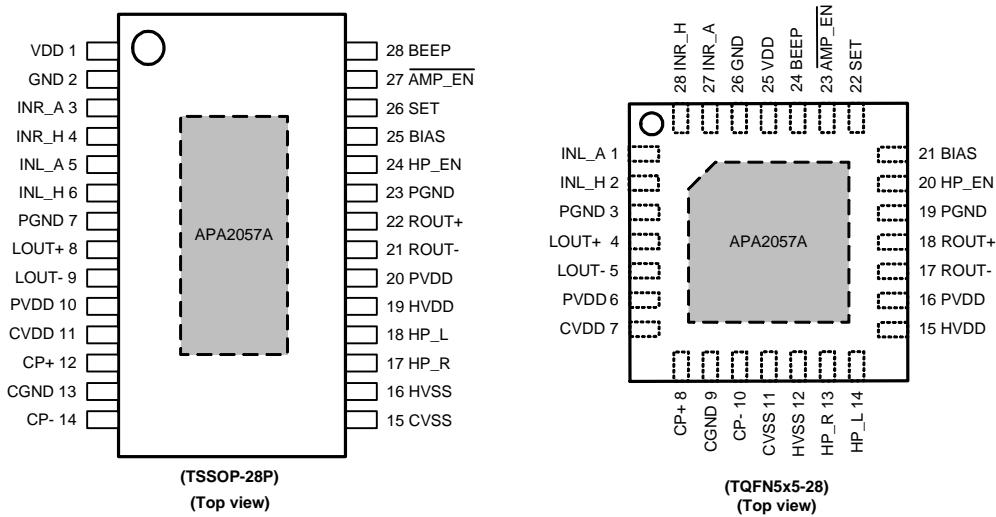

Ordering and Marking Information

| | | |
|---------------|--|--|
| APA2057A | | Package Code R : TSSOP-28P QB : TQFN5x5-28 Operating Ambient Temperature Range I : -40 to 85°C Handling Code TR : Tape & Reel Lead Free Code L : Lead Free Device |
| APA2057A R : | | XXXXX - Date Code |
| APA2057A QB : | | XXXXX - Date Code |

Note: ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS and compatible with both SnPb and lead-free soldering operations. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J STD-020C for MSL classification at lead-free peak reflow temperature.

Pin Configurations

= ThermalPad (connected the ThermalPad to GND plane for better heat dissipation)

Absolute Maximum Ratings (Note 1)

(Over operating free-air temperature range unless otherwise noted.)

| Symbol | Parameter | Rating | Unit |
|--|-------------------------------------|--------------------|------|
| V_{DD} | Supply Voltage (PVDD, CVDD, VDD) | -0.3 to 6 | V |
| HV_{DD} | Supply Voltage (HVDD) | | |
| V_{SS} | Supply Voltage (VSS) | +0.3 to -6 | V |
| V_{SET} , V_{AMP_EN} , V_{HP_EN} | Input Voltage | 0 to $V_{DD}+0.3V$ | |
| T_A | Operating Ambient Temperature Range | -40 to 85 | °C |
| T_J | Maximum Junction Temperature | 150 | °C |

APA2057A

Absolute Maximum Ratings (Cont.) (Note 1)

(Over operating free-air temperature range unless otherwise noted.)

| Symbol | Parameter | Rating | Unit |
|-----------|------------------------------------|--------------------|------|
| T_{STG} | Storage Temperature Range | -65 to +150 | °C |
| T_{SDR} | Maximum Lead Soldering Temperature | 260, 10 seconds | °C |
| P_D | Power Dissipation | Internally Limited | W |

Note 1 : Absolute Maximum Ratings are those values beyond which the life of a device may be impaired. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Thermal Characteristics (Note 2)

| Symbol | Parameter | Value | Unit |
|---------------|--|----------|------|
| θ_{JA} | Thermal Resistance - Junction to Ambient (Note 2) TSSOP-28P TQFN5x5-28 | 45 43 | °C/W |

Note 2 : 3.42 in² printed circuit board with 2OZ trace and copper through 10 vias of 15mil diameter vias. The thermal pad on the TSSOP-28P & TQFN-28 packages with solder on the printed circuit board.

Recommended Operating Conditions

| | | Min. | Max. | Unit |
|--|-------------------------|------|-------------|------|
| Supply voltage, V_{DD} | | 4.5 | 5.5 | V |
| Supply voltage, HV_{DD} | | 3.0 | 3.6 | V |
| High level threshold voltage, V_{IH} | AMP_EN, HP_EN | 2 | | V |
| Low level threshold voltage, V_{IL} | AMP_EN, HP_EN | | 0.8 | V |
| Common mode input voltage, V_{ICM} | for Amplifier | | $V_{DD}-1$ | V |
| | for Headphone Amplifier | | $HV_{DD}-1$ | V |
| Input Voltage (V_{SET}) | Shutdown | | 0.8 | |
| | Gain Setting | 2 | 4.2 | V |
| | Fix Gain | 4.5 | | V |

Electrical Characteristics

Block Diagram

Typical Application Circuit

Application Information

Amplifier Mode Operation

The APA2057A has two pairs of operational amplifiers internally, which allows different amplifier configurations.

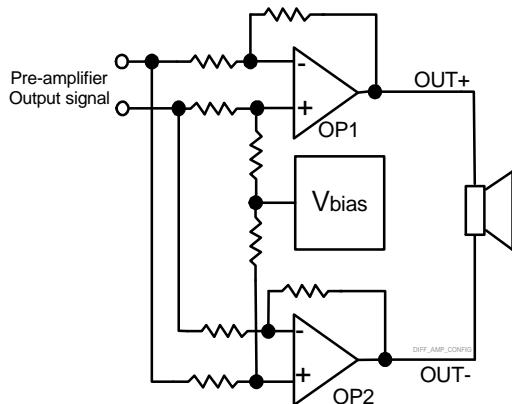

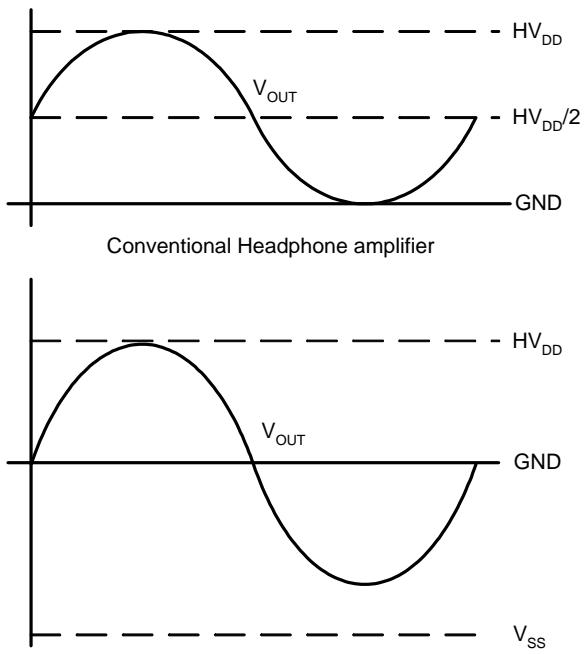

Figure 1: APA2057A internal configuration
(each channel)

The OP1 and OP2 are all differential drive configurations. The differential drive configurations doubling the voltage swing on the load. Compare with the single-ended configuration, the differential gain for each channel is 2X (Gain of SE mode).

By driving the load differentially through outputs OUT+ and OUT-, an amplifier configuration commonly referred to all differential mode is established. All differential mode operation is different from the classical single-ended SE amplifier configuration where one side of its load is connected to ground.

A differential amplifier design has a few distinct advantages over the SE configuration, as it provides differential drive to the load, thus it is doubling the output swing for a specified supply voltage. The output power can be 4 times greater than the SE amplifier working under the same condition. A differential configuration, similar as the one used in APA2057A, also creates a second advantage over SE amplifiers. Since the differential outputs, ROUT+, ROUT-, LOUT+, and LOUT-, are biased at half-supply, there is no need for DC voltage across the load. This eliminates the need for an output coupling capacitor which is required in a single supply, SE configuration.

Headphone Mode Operation

Cap-free Headphone amplifier
Figure 2: Cap-free Operation

The APA2057A's headphone amplifiers uses a charge pump to invert the positive power supply (HV_{DD}) to negative power supply (V_{SS}), see Figure2. The headphone amplifiers operate at this bipolar power supply (HV_{DD} & V_{SS}), and the outputs reference refers to the ground. This feature eliminates the output capacitor that is using in conventional single-ended headphone amplifier. The headphone amplifier internal supply voltage comes from HV_{DD} and V_{SS} . For good AC performance, the HV_{DD} connected to 3.3V is recommended. It can avoid the output over voltage for line out application.

Charge Pump Flying Capacitor

The flying capacitor (C_{CPF}) affects the load transient of the charge pump. If the capacitor's value is too small, then that will degrade the charge pump's current driver capability and the performance of headphone amplifier.

Increasing the flying capacitor's value will improve the load transient of charge pump. It is recommend to use the low ESR ceramic capacitors (X7R type is recommended) above 1 μ F.

Application Information (Cont.)

Charge Pump Output Capacitor

The output capacitor (C_{CPO})'s value affects the power ripple directly at $CV_{ss}(V_{ss})$. Increasing the value of output capacitor reduces the power ripple. The ESR of output capacitor affects the load transient of $CV_{ss}(V_{ss})$. Lower ESR and greater than $1\mu F$ ceramic capacitor (X7R type) is recommended.

Charge Pump Bypass Capacitor

The bypass capacitor (C_{CPB}) relates with the charge pump switching transient. The capacitor's value is same as flying capacitor ($1\mu F$). Place it close to the CV_{DD} and PGND.

Headphone Detection Input

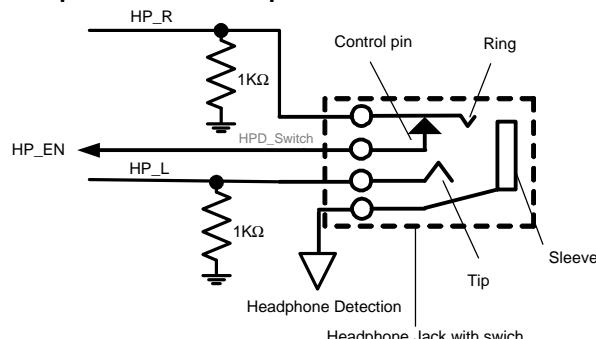

Figure 3 HPD configurations

The HP_EN will detect the voltage. If the voltage is less than 0.8V, the headphone amplifiers will be disabled; if greater than 2V, then the headphone amplifier will be enabled.

In Figure 3, phone-jack with the control pin is used and connected to HP_EN input from control pin. When a headphone plug is inserted, the HP_EN will pull high internally which enables headphone amplifiers; without headphone plug, the HP_EN is pulled to GND.

Operation Mode

The APA2057A amplifier has two pairs of independent amplifier. One for stereo speaker is BTL structure, and the other for headphone is cap-less structure. Each pair has independent input pin; INR_A and INA_L are for stereo speaker drivers, and INR_H and INL_H are for stereo headphone drivers.

- Amplifier mode operation: Pull low the AMP_EN control pin can enable the stereo speaker driver.
- Headphone mode operation: Pull high the HP_EN control pin can enable the cap-less headphone

drive.

- Both amplifier and headphone "ON" mode: Pull low the AMP_EN and pull high the HP_EN control pins, then turn on both speaker drivers and headphone drivers
- Both amplifier and headphone "OFF" mode: Pull high the AMP_EN and pull low the HP_EN control pins, then turn off both speaker drivers and headphone drivers

If the AMP_EN and HP_EN are connected together, then this pin will be connected to headphone jack's control pin (Figure 3), the APA2057A is switchable between "Amplifier mode (Headphone mute), or Headphone mode (Amplifier mute).

Gain Setting

The gain for speaker drivers can be adjustable by applying DC voltage to SET pin. The APA2057A control consists 19 step gain settings from 2.0V~ 4.2V, and the gain is from -7dB to 16dB. Each gain step corresponds to a specific input voltage range, as shown in "Gain Setting Table". To minimize the effect of noise on the gain setting control, which can affect the selected gain level, hysteresis and clock delay are implemented. For the highest accuracy, the voltage shown in the "recommended voltage" column of the table is used to select a desired gain. This recommended voltage is exactly halfway between the two nearest transitions. The amount of hysteresis corresponds to half of the step width, as shown in Figure 4. Apply 0V to SET pin will place the APA2057A into shutdown mode, and when SD =5V, it allows the speaker driver at a fixed gain ($A_V=10.5dB$).

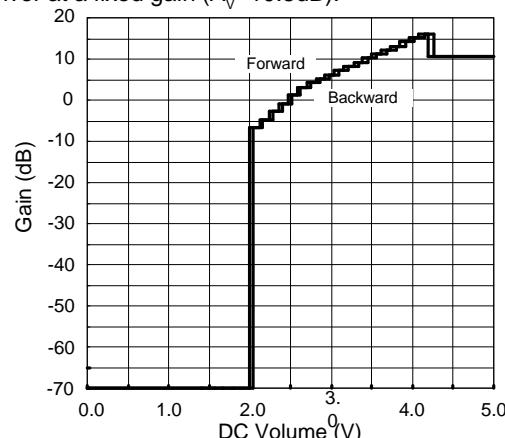

Figure 4: APA2057A Gain setting vs. SET pin Voltage

Application Information (Cont.)

Gain Setting (Cont.)

For headphone driver, the internal feedback resistor is $40\text{k}\Omega$ ($R_{f(HP)}$ external, 10% variation by process), so the headphone driver's gain is set by the input resistor ($R_{i(HP)}$ external), the Table 1 lists the reference gain settings with external resistor for headphone driver (HP Mode).

| HP Mode Gain Setting Table for Reference | | | |
|---|---|--------------|-------------|
| $R_{i(HP)}$,external ($\text{k}\Omega$) | * $R_{i(HP)}$,internal ($\text{k}\Omega$) | HP OUT (V/V) | HP Gain(dB) |
| 62 | 40 | 0.65 | -3.8 |
| 50 | 40 | 0.80 | -1.9 |
| 39 | 40 | 1.03 | 0.2 |

Table 1: Gain Setting Table for Reference

Input Capacitor, C_i

In the typical application, an input capacitor, C_i , is required to allow the amplifier to bias the input signal to the proper DC level for optimum operation. In this case, C_i and the minimum input impedance R_i from a high-pass filter with the corner frequency are determined by the following equation:

$$F_C(\text{highpass}) = \frac{1}{(2\pi R_i(\text{MIN}) \times C_i)} \quad (1)$$

The value of C_i is important to consider as it directly affects the low frequency performance of the circuit. Consider the example where R_i is $10\text{k}\Omega$ and the specification calls for a flat bass response down to 10Hz. Equation is reconfigured as below:

$$C_i = \frac{1}{(2\pi R_i F_C)} \quad (2)$$

Consider to input resistance variation, the C_i is $1.6\mu\text{F}$, so one would likely choose a value in the range of $2.2\mu\text{F}$ to $3.3\mu\text{F}$. A further consideration for this capacitor is the leakage path from the input source through the input network ($R_i + R_f$, C_i) to the load. This leakage current creates a DC offset voltage at the input to the amplifier that reduces useful headroom, especially in high gain applications. For this reason, a low-leakage tantalum or ceramic capacitor is the best choice. When polarized capacitors are used, the positive side of the capacitor should face the amplifier input. As the DC level is held at $V_{DD}/2$, which is likely higher than the source DC level.

Please note that it is important to confirm the capacitor polarity in the application.

Note: The headphone driver's input is ground reference, so please check the $C_{i(HP)}$'s polarized at design.

Effective Bias Capacitor, C_B

As with any power amplifier, proper supply bypassing is critical for low noise performance and high power supply rejection.

The capacitor location on both the bypass and power supply pins should be as close to the device as possible. The effect of a larger bypass capacitor is improved PSRR due to increased 1.8V bias voltage stability. Typical applications employ a 5V regulator with $2.2\mu\text{F}$ and a $0.1\mu\text{F}$ bypass capacitor, which aids in supply filtering. This does not eliminate the need for bypassing the supply nodes of the APA2057A. The selection of bypass capacitors, especially C_B , is thus dependent upon desired PSRR requirements and click-and-pop performance.

Power Supply Decoupling, C_s

The APA2057A is a high-performance CMOS audio amplifier that requires adequate power supply decoupling to ensure the output total harmonic distortion (THD+N) is as low as possible. Power supply decoupling also prevents the oscillations causing by long lead length between the amplifier and the speaker. The optimum decoupling is achieved by using two different types of capacitor that target on different types of noise on the power supply leads. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically $0.1\mu\text{F}$, is placed as close as possible to the device V_{DD} lead works best (the pin1 (V_{DD}) and pin2 (GND)'s capacitor must short less than 1cm). For filtering lower-frequency noise signals, a large aluminum electrolytic capacitor of $10\mu\text{F}$ or greater is placed near the audio power amplifier is recommended.

Shutdown Function

In order to reduce power consumption while not in use, the APA2057A contains a shutdown pin to externally turn off the amplifier bias circuitry. This shutdown feature turns the amplifier off when a logic low is placed on the

Application Information (Cont.)

Shutdown Function (Cont.)

SET pin. The trigger point between a logic high and logic low level is typically 2.0V. It is the best to switch between ground and the supply V_{DD} to provide maximum device performance.

By switching the SET pin to low, the amplifier enters a low-current consumption state, $I_{DD} < 80\mu A$. Even the APA2057A is in shutdown mode, PC_BEEP will keep detecting circuit. In normal operating, SET pin is pulled to high level to keep the IC out of the shutdown mode. The SET pin should be tied to a definite voltage to avoid unwanted state changes. The wake-up time of shutdown is about 150ms, and the shutdown release's pop is caused by the operational amplifier's offset.

PC-BEEP Detection

The APA2057A integrates a PCBEEP circuit detection for notebook PC using. When PC-BEEP signal drives to PCBEEP input pin, PCBEEP mode is active. The APA2057A will turn on speaker drivers and the internal gain is fixed as 0dB. The PCBEEP signal becomes the amplifiers input signal. If the amplifiers in the shutdown mode, it will be out of shutdown mode whenever PCBEEP mode is enabled. The APA2057A will return to previous setting when it is out of PC BEEP mode. The input impedance is $100K\Omega$ on PCBEEP input pin.

Speaker Driver Amplifier Efficiency

An easy-to-use equation to calculate efficiency starts out as being equal to the ratio of power from the power supply to the power delivered to the load. The following equations are the basis for calculating amplifier efficiency.

$$\text{Efficiency} = \frac{P_o}{Psup} \quad (3)$$

Where:

$$P_o = \frac{V_{O\text{rms}} * V_{O\text{rms}}}{R_L} = \frac{(V_p * V_p)}{2R_L} \quad (4)$$

$$V_{O\text{rms}} = \frac{V_p}{\sqrt{2}} \quad (5)$$

$$Psup = V_{DD} * I_{DD}(\text{AVG}) = V_{DD} * \frac{2V_p}{\pi R_L} \quad (6)$$

Efficiency of a Differential configuration:

$$\frac{P_o}{Psup} = \left\{ \frac{(V_p * V_p)}{2R_L} \right\} / \left\{ V_{DD} * \frac{2V_p}{\pi R_L} \right\} = \frac{\pi R_L}{4V_{DD}} \quad (7)$$

Table 1 calculates efficiencies for four different output

power levels. Note that the efficiency of the amplifier is quite low for lower power levels and rises sharply as power to the load is increased resulting in nearly flat internal power dissipation over the normal operating range. Note that the internal dissipation at full output power is less than in the half power range. Calculating the efficiency for a specific system is the key to proper power supply design. For a stereo 1W audio system with 8W loads and a 5V supply, the maximum draw on the power supply is almost 3W.

| Po (W) | Efficiency (%) | IDD(A) | VPP(V) | PD (W) |
|--------|----------------|--------|--------|--------|
| 0.25 | 31.25 | 0.16 | 2.00 | 0.55 |
| 0.50 | 47.62 | 0.21 | 2.83 | 0.55 |
| 1.00 | 66.67 | 0.30 | 4.00 | 0.5 |
| 1.25 | 78.13 | 0.32 | 4.47 | 0.35 |

**High peak voltages cause the THD+N to increase

Table 2. Efficiency vs. Output Power in 5-V/8W Differential Amplifier Systems.

A final point to remember about linear amplifiers is how to manipulate the terms in the efficiency equation to utmost advantage when possible. Note that in equation, V_{DD} is in the denominator. This indicates that as V_{DD} goes down, efficiency goes up. In other words, using the efficiency analysis to choose the correct supply voltage and speaker impedance for the application.

Power Dissipation

Whether the power amplifier is operated in BTL or SE modes, power dissipation is a major concern. Equation 8 states the maximum power dissipation point for a SE mode operating at a given supply voltage and driving a specified load.

$$\text{SE mode: } P_{D,\text{MAX}} = \frac{V_{DD}^2}{2\pi R_L} \quad (8)$$

In BTL mode operation, the output voltage swing is doubled as in SE mode. Thus the maximum power dissipation point for a BTL mode operating at the same given conditions is 4 times as in SE mode.

$$\text{BTL mode: } P_{D,\text{MAX}} = \frac{4V_{DD}^2}{2p^2 R_L} \quad (9)$$

Since the APA2057A is a dual channel power amplifier, the maximum internal power dissipation is 2 times that both of equations depending on the mode of operation. Even with this substantial increasing in power dissipation, the APA2057A does not require extra heatsink. The

Application Information (Cont.)

Power Dissipation (Cont.)

power dissipation from equation 9, assuming a 5V-power supply and an 8Ω load, must not be greater than the power dissipation that results from the equation 9:

$$P_{D,MAX} = \frac{T_{J,MAX} - T_A}{\theta_{JA}} \quad (10)$$

For TSSOP-28 package with thermal pad, the thermal resistance (θ_{JA}) is equal to 45°C/W.

Since the maximum junction temperature ($T_{J,MAX}$) of APA2057A is 150°C and the ambient temperature (T_A) is defined by the power system design, the maximum power dissipation that the IC package is able to handle can be obtained from equation 10. Once the power dissipation is greater than the maximum limit ($P_{D,MAX}$), either the supply voltage (V_{DD}) must be decreased, the load impedance (R_L) must be increased or the ambient temperature should be reduced.

Thermal Pad Considerations

The thermal pad must be connected to ground. The package with thermal pad of the APA2057A requires special attention on thermal design. If the thermal design issues are not properly addressed, the APA2057A 4Ω will go into thermal shutdown when driving a 4Ω load. The thermal pad on the bottom of the APA2057A should be soldered down to a copper pad on the circuit board. Heat can be conducted away from the thermal pad through the copper plane to ambient. If the copper plane is not on the top surface of the circuit board, 8 to 10 vias of 15 mil or smaller in diameter should be used to thermally couple the thermal pad to the bottom plane. For good thermal conduction, the vias must be plated through and solder filled. The copper plane used to conduct heat away from the thermal pad should be as large as practical.

If the ambient temperature is higher than 25°C, a larger copper plane or forced-air cooling will be required to keep the APA2057A junction temperature below the thermal shutdown temperature (150°C).

In higher ambient temperature, higher airflow rate and/or larger copper area will be required to keep the IC out of thermal shutdown. See Demo Board Circuit Layout as an example for PCB layout.

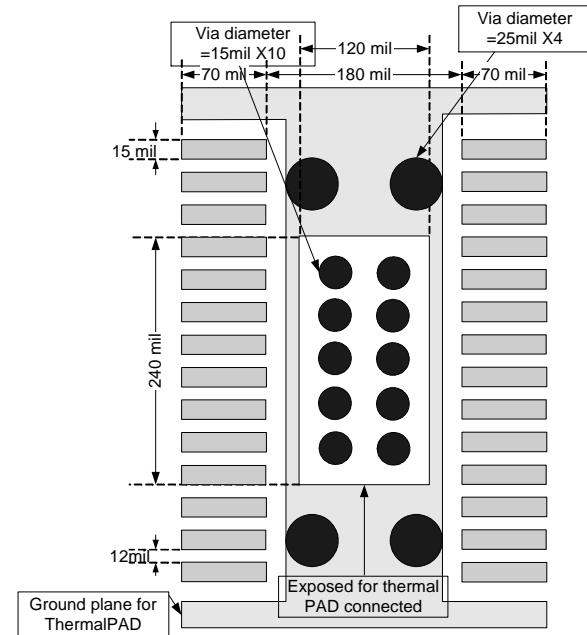

Figure 5: TSSOP-28P layout recommendation

Thermal Considerations

Linear power amplifiers dissipate a significant amount of heat in the package under normal operating conditions. In the Power Dissipation vs. Output Power graph, the APA2057A is operating at a 5V supply and a 4Ω speaker that 2W output power peaks are available. The vertical axis gives the information of power dissipation (P_D) in the IC with respect to each output driving power (P_o) on the horizontal axis.

This is valuable information when attempting to estimate the heat dissipation of the IC requirements for the amplifier system.

Using the power dissipation curves for a 5V/4Ω system, the internal dissipation in the APA2057A and maximum ambient temperatures is shown in Table 3.

| Peak output power (W) | Average output power (W) | Power dissipation (W/channel) | Max. T_A (°C) |
|-----------------------|--------------------------|-------------------------------|------------------|
| | | | With thermal pad |
| 2 | 1.95 | 1.25 | 37 |
| 2 | 1.17 | 1.25 | 37 |
| 2 | 0.74 | 1.19 | 43 |
| 2 | 0.43 | 1.05 | 55 |
| 2 | 0.19 | 0.8 | 78 |

Thermal Considerations (Cont.)

| Package | q_{JA} |
|----------|----------|
| TSSOP-28 | 45°C/W |
| TQFN -28 | 43°C/W |

Table 4: Thermal resistance Table

This parameter is measured with the recommended copper heat sink pattern on a 2-layer PCB, 23cm² in 5.7mm * 4mm in PCB, 2oz. Copper, 100mm² coverage. Airflow 0 CFM the maximum ambient temperature depends on the heat sink ability of the PCB system.

To calculate maximum ambient temperatures, first consideration is that the numbers from the dissipation graphs are per channel values, so the dissipation of the IC heat needs to be doubled for two-channel operation.

Given θ_{JA} , the maximum allowable junction temperature ($T_{J,Max}$), and the total internal dissipation (P_D), the maximum ambient temperature can be calculated with the following equation. The maximum recommended junction temperature for the APA2057A is 150°C. The internal dissipation figures are taken from the Power Dissipation vs. Output Power graph.

$$T_{A,Max} = T_{J,Max} - \theta_{JA} P_D \quad (11)$$

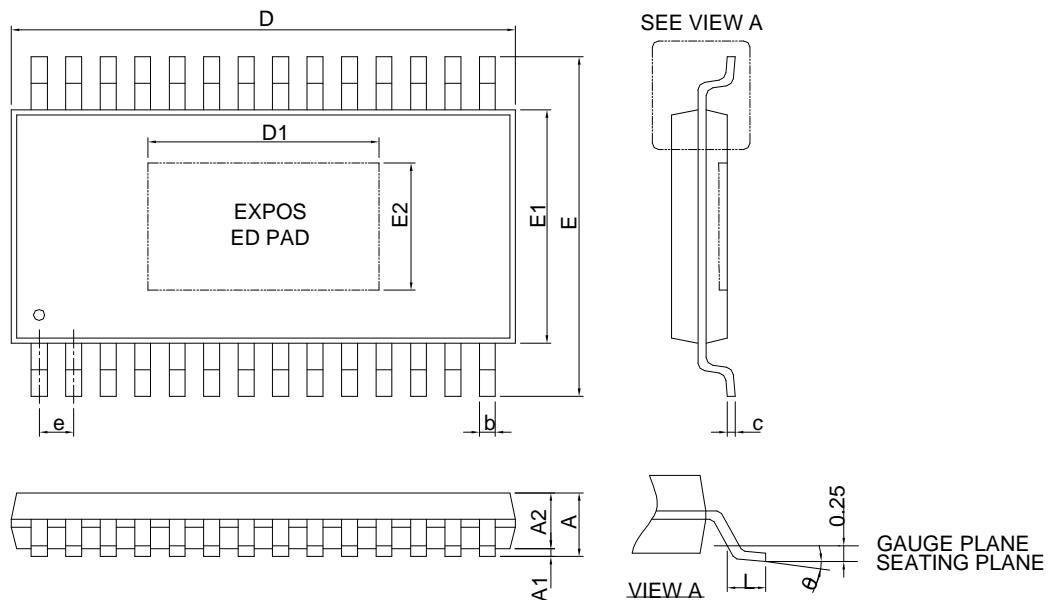

$$150 - 45(0.8*2) = 78^\circ\text{C} \text{ (with thermal pad)}$$

NOTE: Internal dissipation of 0.8W is estimated for a 2W system with 15-dB headroom per channel.

Table 3 shows that for some applications, no airflow is required to keep junction temperatures in the specified range. The APA2057A is designed with a thermal shutdown protection that turns the device off when the junction temperature surpasses 150°C to prevent IC from damage. The information in table 3 was calculated for maximum listen volume with limited distortion. When the output level is reduced, the numbers in the table change significantly. Also, using 8Ω speakers will dramatically increase the thermal performance by increasing amplifier efficiency.
