## +3.3V Rising Edge Data Strobe LVDS Receiver 28-Bit Channel Link—66 MHz, +3.3V Rising Edge Strobe LVDS Receiver 21-Bit Channel Link—66 MHz

### General Description

The DS90CR286A receiver converts the four LVDS data streams (Up to 1.848 Gbps throughput or 231 Megabytes/sec bandwidth) back into parallel 28 bits of CMOS/TTL data. Also available is the DS90CR216A that converts the three LVDS data streams (Up to 1.386 Gbps throughput or 173 Megabytes/sec bandwidth) back into parallel 21 bits of CMOS/TTL data. Both Receivers' outputs are Rising edge strobe.

Both devices are offered in TSSOP packages.

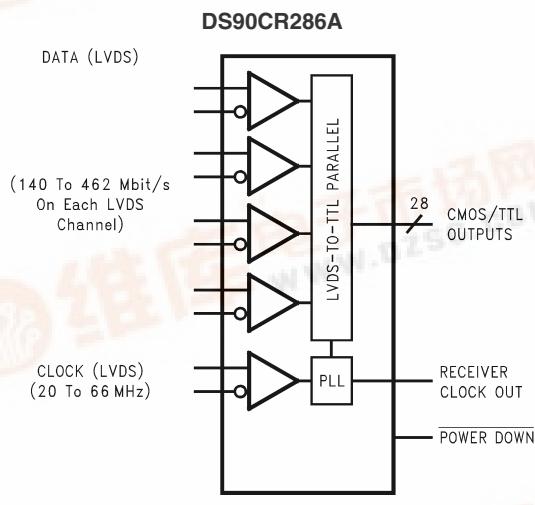

The DS90CR286A / DS90CR216A devices are enhanced over prior generation receivers and provided a wider data valid time on the receiver output.

This chipset is an ideal means to solve EMI and cable size problems associated with wide, high speed TTL interfaces.

**Note 4:** Receiver Skew Margin is defined as the valid data sampling region at the receiver inputs. This margin takes into account the transmitter pulse positions (min and max) and the receiver input setup and hold time (internal data sampling window - RSPos). This margin allows for LVDS interconnect skew, inter-symbol interference (both dependent on type/length of cable), and clock jitter (less than 250 ps).

**Note 5:** Total latency for the channel link chipset is a function of clock period and gate delays through the transmitter (TCCD) and receiver (RCCD). The total latency for the 215/285 transmitter and 216A/286A receiver is:  $(T + TCCD) + (2*T + RCCD)$ , where  $T$  = Clock period.

C—Setup and Hold Time (Internal data sampling window) defined by Rspos (receiver input strobe position) min and max

Tppos—Transmitter output pulse position (min and max)

RSKM = Cable Skew (type, length) + Source Clock Jitter (cycle to cycle) (Note 6) + ISI (Inter-symbol interference) (Note 7)

Cable Skew—typically 10 ps–40 ps per foot, media dependent

**Note 6:** Cycle-to-cycle jitter is less than TBD ps at 66 MHz.

**Note 7:** ISI is dependent on interconnect length; may be zero.

RxOUT	O	21	TTL level data outputs.

RxCLK IN-	I	1	Negative LVDS differential clock input.
RxCLK OUT	O	1	TTL level clock output. The rising edge acts as data strobe.
PWR DOWN	I	1	TTL level input. When asserted (low input) the receiver outputs are low.

PLL GND	I	2	Ground pin for PLL.
LVDS V <sub>cc</sub>	I	1	Power supply pin for LVDS inputs.
LVDS GND	I	3	Ground pins for LVDS inputs.

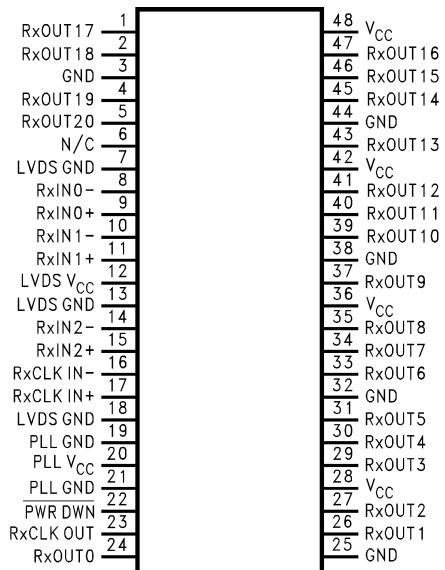

**Note 8:** These receivers have input failsafe bias circuitry to guarantee a stable receiver output for floating or terminated receiver inputs. Under these conditions receiver inputs will be in a HIGH state. If a clock signal is present, outputs will all be HIGH; if the clock input is also floating/terminated outputs will remain in the last valid state. A floating/terminated clock input will result in a LOW clock output.
