

# GM7130 3A STEP-DOWN VOLTAGE REGULATORS

Power Management

## Description

The GM7130 series of regulators provide all the active functions for a step-down (buck) switching regulator, and drive 3A load with excellent line and load regulation. GM7130's are available in fixed output voltages of 3.3V, 5V, 12V, 15V, and a versatile Adjustable output version. These regulators are simple to use and require a minimum number of external components. Features include internal frequency compensation and a fixed-frequency oscillator. The GM7130 series are high-efficiency replacements for popular three-terminal linear regulators, requiring a smaller heatsink or even no heatsink. The GM7130's perform well with standard inductors from several manufacturers, simplifying the design of switch-mode power supplies. The GM7130 series guarantee  $\pm 4\%$  tolerance on output voltage within specified input voltages and output load conditions, and  $\pm 10\%$  on the oscillator frequency. External shutdown is included, with 50  $\mu\text{A}$  (typical) standby current. The output switch has cycle-by-cycle current limiting, as well as thermal shutdown for full protection under fault conditions.

## Features

- ◆ 3.3V, 5V, 12V, 15V, Adjustable output versions
- ◆ Adjustable version output voltage range 1.23V to 37V  $\pm 4\%$  max over line and load conditions
- ◆ 3A output current
- ◆ Input voltage range 7V to 40V
- ◆ Requires only 4 external components
- ◆ High efficiency
- ◆ TTL shutdown capability, low power standby mode
- ◆ Thermal shutdown, current limit protection
- ◆ Uses standard inductors
- ◆ 52 kHz fixed frequency internal oscillator

## Application

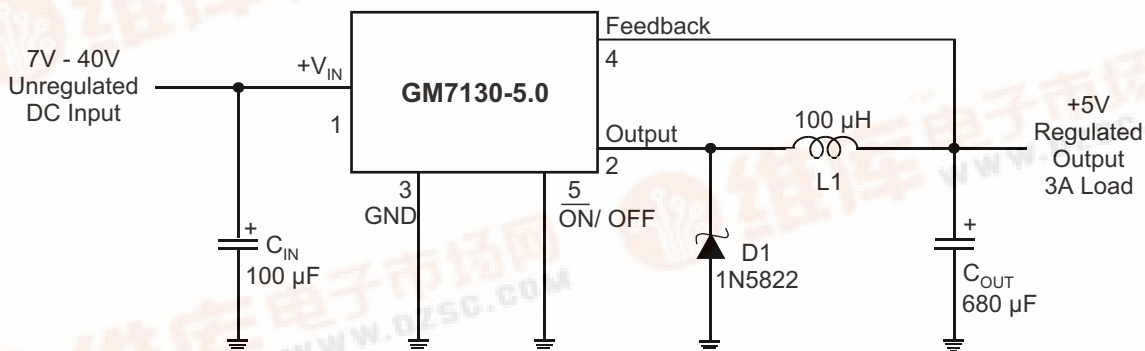

Pre-regulator for linear regulators

High-efficiency step-down buck regulator

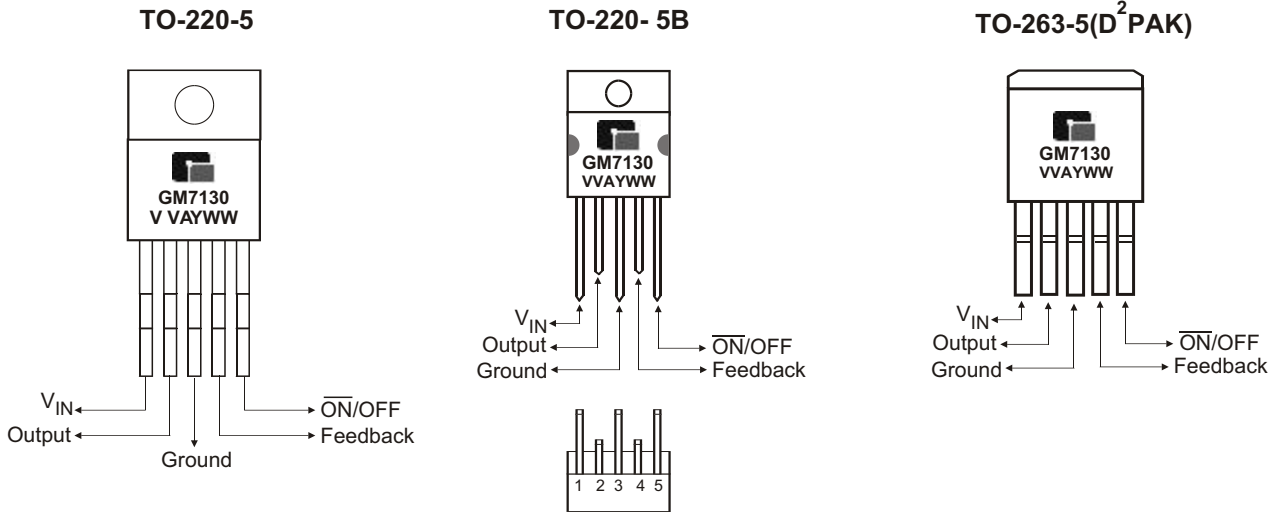

On-card/ board switching regulators

Positive to negative converter (buck-boost)

## ◆ ELECTRICAL CHARACTERISTICS

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. Guaranteed specifications and Test conditions are shown in Electrical Characteristics.

**Note 2:** All limits guaranteed at 25°C (standard type face) and over full operating temperature range (bold type face). All 25°C limits are 100% production tested. All limits over full operating temperature range are guaranteed via correlation using standard Statistical Quality Control methods.

**Note 3:** External components such as the catch diode, inductor, input and output capacitors can affect switching regulator system performance. When the GM7130 is used as shown in the Figure 1 test circuit, system performance will be as shown in system parameters section of Electrical Characteristics.

**Note 4:** Output pin sourcing current. No diode, inductor or capacitor connected to output.

**Note 5:** Feedback pin removed from output and connected to 0V.

**Note 6:** Feedback pin removed from output and connected to +12V for the Adjustable, 3.3V, and 5V versions, and +25V for the 12V and 15V versions, to force the output transistor OFF.

**Note 7:**  $V_{IN} = 40V$

**Note 8:** Junction to ambient thermal resistance (no external heat sink) for the 5 lead TO-220 package mounted vertically, with ½ inch leads in a socket, or on a PC board with minimum copper area.

**Note 9:** Junction to ambient thermal resistance (no external heat sink) for the 5 lead TO-220 package mounted vertically, with ¼ inch leads soldered to a PC board containing approximately 4 square inches of copper area surrounding the leads.

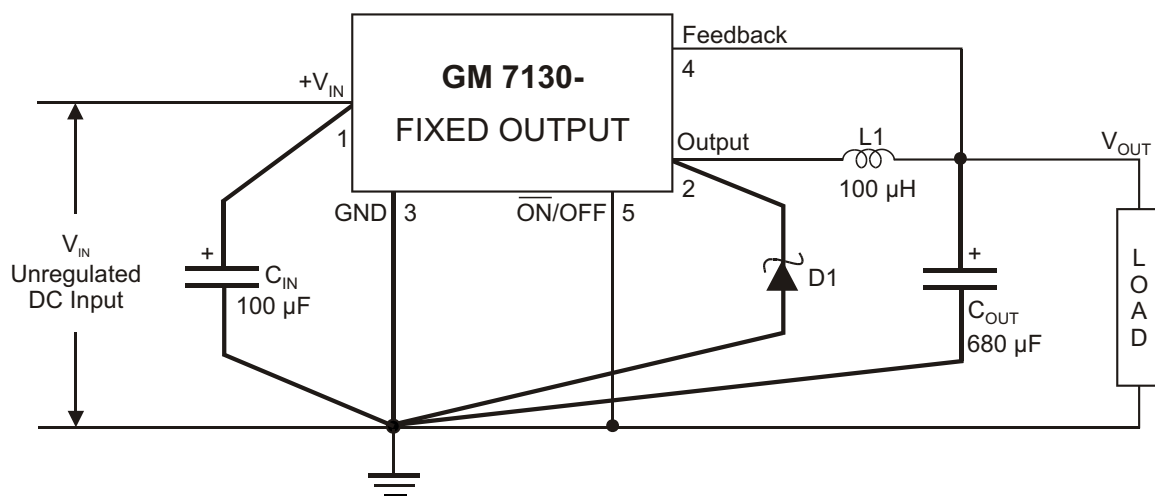

**Note 10:** If the TO-263 package is used, the thermal resistance can be reduced by increasing the PC board Copper area thermally connected to the package. Using 0.5 square inches of copper area,  $\theta_{JA}$  is 50°C/W, with 1 square inch of copper area,  $\theta_{JA}$  is 37°C/W, and with 1.6 or more square inches of copper area,  $\theta_{JA}$  is 32°C/W.

**Note 11:** The oscillator frequency reduces to approximately 11 kHz in the event of an output short or an Overload which causes the regulated output voltage to drop approximately 40% from the nominal output voltage. This self-protection feature lowers the Average power dissipation of the GM7130 By lowering the minimum duty cycle from 5% down to approximately 2%.

### ◆ TEST CIRCUIT AND LAYOUT GUIDELINES

Careful layout is important with any switching regulator. Rapidly switching currents associated with wiring inductance generate voltage transients which can cause problems. To minimize inductance and ground loops, the lengths of the leads indicated by heavy lines in Figure 1 below should be kept as short as possible. Single-point grounding (as indicated in Figure 1) or ground plane construction should be used for best results. When using the Adjustable version, place the programming resistors as close as possible to the GM7130, to keep the sensitive feedback wiring short.

$$E \cdot T = (V_{IN} - V_{OUT}) \frac{V_{OUT}}{V_{IN}} \cdot \frac{1,000}{F(\text{in kHz})}$$

**PROCEDURE(Adjustable Output Voltage Versions)**

**Given:**

- $V_{OUT}$  = Regulated Output Voltage
- $V_{IN}(\text{Max})$  = Maximum Input Voltage
- $I_{LOAD}(\text{Max})$  = Maximum Load Current
- $F$  = Switching Frequency (Fixed at 52 kHz)

1. Programming Output Voltage(Selecting R1 and R2, as shown in Figure 12. And Figure 13.

Use the following formula to select the appropriate resistor values.

$$V_{OUT} = V_{REF} \left( 1 + \frac{R_2}{R_1} \right) \quad \text{where } V_{REF} = 1.23V$$

$R_1$  can be between 1k and 5k. (For best temperature coefficient and stability with time, use 1% metal film resistors)

$$R_2 = R_1 \left( \frac{V_{OUT}}{V_{REF}} - 1 \right)$$

**EXAMPLE (Adjustable Output Voltage Versions)**

**Given:**

- $V_{OUT} = 10V$
- $V_{IN}(\text{Max}) = 25V$
- $I_{LOAD}(\text{Max}) = 3A$
- $F = 52kHz$

1. Programming Output Voltage (Selecting R1 and R2)

$$V_{OUT} = 1.23 \left( 1 + \frac{R_2}{R_1} \right) \quad \text{Select } R_1 = 1k$$

$$R_2 = R_1 \left( \frac{V_{OUT}}{V_{REF}} - 1 \right) = 1k \left( \frac{10V}{1.23V} - 1 \right)$$

$R_2 = 1k (8.13 - 1) = 7.13k$ . closest 1% value is 7.15k
