## GSC3842 HIGH PERFORMANCE CURRENT MODE CONTROLLERS

### Description

The GSC3842 is high performance fixed frequency current mode controllers. This is specifically designed for Off-Line and DC To DC converter applications offering the designer a cost-effective solution with minimal external components.

These integrated circuits feature a trimmed oscillator for precise duty cycle control. A temperature compensated reference, high gain Error amplifier, current sensing comparator, and a high current totem pole output ideally suited for driving a power MOSFET. Also Included are protective features consisting of input and reference undervoltage lockouts each with hysteresis, cycle-by-cycle current limiting, programmable output deadtime, and latch for single pulse metering.

### Features

- \*Trimmed Oscillator for Precise Frequency Control
- \*Oscillator Frequency Guaranteed at 250kHz
- \*Current Mode Operation to 500kHz
- \*Automatic Feed Forward Compensation
- \*latching PWM for Cycle-By-Cycle Current Limiting
- \*Internally Trimmed Reference with Undervoltage Lockout
- \*High Current Totem Pole Output
- \*Undervoltage Lockout with Hysteresis
- \*Low Startup and Operating Current

### Package Dimensions

### Marking :

| REF. | Millimeter |      | REF. | Millimeter |      |
|------|------------|------|------|------------|------|
|      | Min.       | Max. |      | Min.       | Max. |
| A    | 5.80       | 6.20 | M    | 0.10       | 0.25 |
| B    | 4.80       | 5.00 | H    | 0.35       | 0.49 |
| C    | 3.80       | 4.00 | L    | 1.35       | 1.75 |
| D    | 0°         | 8°   | J    | 0.375 REF. |      |
| E    | 0.40       | 0.90 | K    | 45°        |      |
| F    | 0.19       | 0.25 | G    | 1.27 TYP.  |      |

| SOP-8L | Function               | Description                                                                                                                                                       |
|--------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | Pin1: Compensation     | This pin is the Error Amplifier output and is made available for loop compensation.                                                                               |
|        | Pin2: Voltage Feedback | This is the inverting input of the Error Amplifier. It's normally connected to the Switching power supply output through a resistor divider.                      |
|        | Pin3: Current Sense    | A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.                   |
|        | Pin4: RT/CT            | The oscillator frequency and maximum output duty cycle are programmed by connecting resistor RT to Vref and capacitor CT to ground. Operation 500kHz is possible. |
|        | Pin5: Ground           | This pin is the combined control circuitry and power ground.                                                                                                      |
|        | Pin6: Output           | This output directly drives the gate of a power MOSFET. Peak currents up to 1 A are sourced and sunk by this pin.                                                 |
|        | Pin7: Vcc              | This pin is the positive supply of the control IC.                                                                                                                |
|        | Pin8: Vref             | This is the reference output. It provides charging current for capacitor CT through resistor RT.                                                                  |

### Absolute Maximum Ratings at Ta = 25°C

| Parameter                                 | Symbol   | Value       | Unit |
|-------------------------------------------|----------|-------------|------|
| Total power Supply and Zener current      | (ICC+Iz) | 30          | mA   |
| Output current, source or sink(note1)     | Io       | 1.0         | A    |
| Output energy(capacitive load per cycle)  | W        | 5.0         | μJ   |
| Current sense and voltage feedback inputs | Vin      | -0.3 to 5.5 | V    |
| Error Amplifier Output Sink Current       | Io       | 10          | mA   |

|                                              |            |            |            |
|----------------------------------------------|------------|------------|------------|
| Power Dissipation at Thermal characteristics | PD<br>P8JA | 702<br>178 | mW<br>°C/W |
| Storage Temperature Range                    | Tstg       | -65 to 150 | °C         |
| Operating Junction Temperature               | TJ         | +150       | °C         |
| Operating ambient Temperature                | TA         | 0~+70      | °C         |

## Electrical Characteristics (0°C≤TA≤70°C, Vcc=15V [note 2], RT=10k, CT=3.3nF, unless otherwise specified)

| Parameter                                 | Symbol       | Test Conditions               | Min        | Typ      | Max        | Unit  |
|-------------------------------------------|--------------|-------------------------------|------------|----------|------------|-------|
| Reference Section                         |              |                               |            |          |            |       |

| Min. Operating Voltage After Turn-on(VCC) | VCC(min)     | -                             | 8.5        | 10       | 11.5       | V     |

| PWM Section                    |                                 |                       |    |     |     |    |
|--------------------------------|---------------------------------|-----------------------|----|-----|-----|----|
| Maximum Duty Cycle             | DC(MAX)                         | -                     | 94 | 96  | -   | %  |
| Minimum Duty Cycle             | DC(MIN)                         | -                     | -  | -   | 0   | %  |
| Total Device                   |                                 |                       |    |     |     |    |
| Power Startup Supply Current   | I <sub>CC</sub> +I <sub>C</sub> | V <sub>CC</sub> =14V  | -  | 0.3 | 0.5 | mA |
| Power Operating Supply Current | I <sub>CC</sub> +I <sub>C</sub> | Note 2                | -  | 12  | 17  | mA |
| Power Supply Zener Voltage     | V <sub>Z</sub>                  | I <sub>CC</sub> =25mA | 30 | 36  | -   | V  |

Note 1: Maximum Package power dissipation limits must be observed.

Note 2: Adjust V<sub>CC</sub> above the Startup threshold before setting to 15V.

Note 3: This parameter is measured at the latch trip point with V<sub>FB</sub>=0V.

Note 4: Comparator gain is defined as::

$$AV = \frac{\Delta V \text{ Output Compensation}}{\Delta V \text{ Current Sense Input}}$$

## Application Information

### Open Loop Test Circuit

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin5 in a single point ground. The transistor and 5KΩ potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin3.

### Oscillator and Output Waveforms

### Error Amp Configuration

### Under Voltage Lockout

## Current Sense Circuit

Peak current ( $I_s$ ) is determined by the formula

$$I_{s(max)} \approx 1V/R_s$$

A small RC filter may be required to suppress switch transients.

## Slope Compensation Techniques

## Isolated MOSFET Drive and Current Transformer Sensing

## Latched Shutdown

SCR must be selected for a holding current of less than 0.5mA at TA(min). The simple two transistor circuit can be used in place of the SCR as shown. All resistors are 10K.

## Error Amplifier Compensation

Error Amp compensation circuit for stabilizing any current-mode topology except for boost and flyback converters operating with continuous inductor current

Error Amp compensation circuit for stabilizing current-mode boost and flyback topologies operating with continuous inductor current.

## External Clock Synchronization

The diode clamp is required if the Sync amplitude is large enough to cause the bottom side of CT to go more than 300mV below ground

## Soft-Start and Error Amplifier Output Duty Cycle Clamp

## Soft-Start Circuit

## External Duty Cycle Clamp and Multi Unit Synchronization
