

HT83R074 Q-Voice™

Technical Document

- [Tools Information](#)
- [FAQs](#)
- [Application Note](#)

Features

- Operating voltage: 2.4V~5.2V
- Up to 1 μ s (0.5 μ s) instruction cycle with 4MHz (8MHz) system clock
- System clock: 4MHz~8MHz (2.4V)
- Crystal or RC oscillator for system clock
- 12 I/O pins
- 2K \times 15 program ROM
- 80 \times 8 RAM
- 1536K voice ROM size
- 72 sec voice length
- Two 8-bit programmable timer counter with 8-stage prescaler and one time base counter
- Watchdog Timer
- 4-level subroutine nesting
- HALT function and wake-up feature reduce power consumption
- PWM circuit direct drive speaker or output by transistor
- 28-pin SOP package

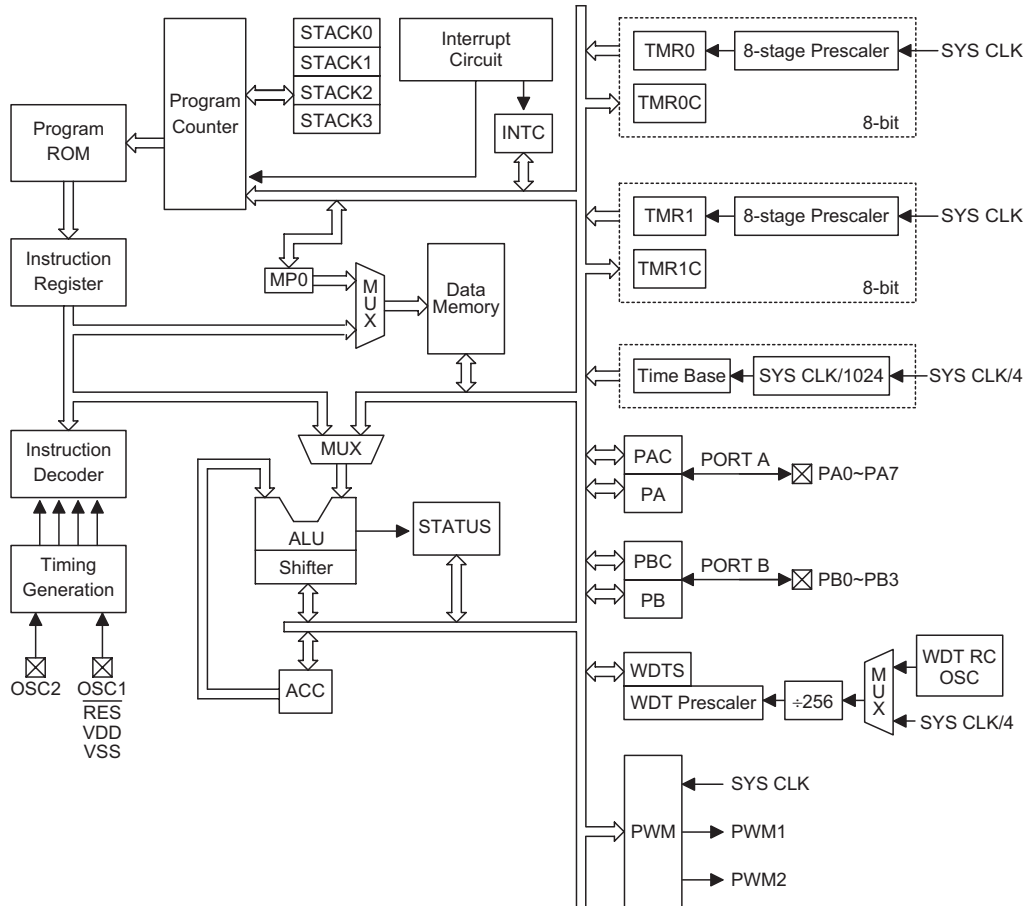

Applications

- Intelligent educational leisure products
- Alert and warning systems
- Sound effect generators

General Description

The HT83R074 is 8-bit high performance microcontroller with voice synthesizer and tone generator. The HT83R074 is designed for applications on multiple I/Os with sound effects, such as voice and melody. It can provide various sampling rates and beats, tone levels, tempos for speech synthesizer and melody generator.

The HT83R074 is excellent for versatile voice and sound effect product applications. The efficient MCU instructions allow users to program the powerful custom applications. The system frequency of HT83R074 can be up to 8MHz under 2.4V and include a HALT function to reduce power consumption.

Pad Description

Pad Name	I/O	Option	Description
PA0~PA7	I/O	Wake-up, Pull-high or None	Bidirectional 8-bit I/O port. Each pin can be configured as a wake-up input by configuration option. Software instructions determine the CMOS output or Schmitt trigger input with or without pull-high resistor (configuration option).
PB0~PB3	I/O	Pull-high or None	Bidirectional 4-bit I/O port. Software instructions determine the CMOS output or Schmitt trigger input (pull-high resistor depending on configuration option).
VSS	—	—	Negative power supply, ground
VDD	—	—	Positive power supply
VSSP	—	—	PWM negative power supply, ground
VDDP	—	—	PWM positive power supply
RES	I	—	Schmitt trigger reset input, active low
OSC1, OSC2	—	RC or Crystal	OSC1 and OSC2 are connected to an RC network or crystal (by configuration option) for the internal system clock. In the case of RC operation, OSC2 is the output terminal for 1/4 system clock. The system clock may come from the crystal, the two pins cannot be floating.
PWM1, PWM2	O	—	PWM output for driving an external transistor or speaker.

Absolute Maximum Ratings

Supply Voltage	$V_{SS}+2.4V$ to $V_{SS}+5.5V$	Storage Temperature	$-50^{\circ}C$ to $125^{\circ}C$
Input Voltage	$V_{SS}-0.3V$ to $V_{DD}+0.3V$	Operating Temperature	$-20^{\circ}C$ to $70^{\circ}C$

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

Functional Description

Execution Flow

The system clock for the HT83R074 is derived from either a crystal or RC oscillator. It is internally divided into four non-overlapping clocks. One instruction cycle consists of four system clock cycles.

Instruction fetching and execution are pipelined in such a way that a fetch takes one instruction cycle while decoding and execution takes the next instruction cycle. However, the pipelining scheme causes each instruction to effectively execute within one cycle. If an instruction changes the Program Counter, two cycles are required to complete the instruction.

Program Counter – PC

The 11-bit program counter (PC) controls the sequence in which the instructions stored in program ROM are executed.

After accessing a program memory word to fetch an instruction code, the contents of the program counter are

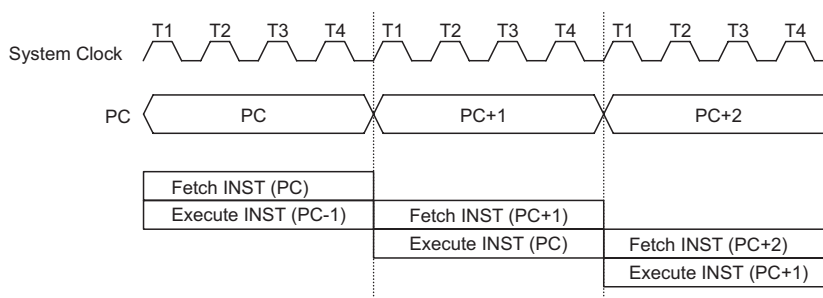

incremented by one. The program counter then points to the memory word containing the next instruction code.

When executing a jump instruction, conditional skip execution, loading PCL register, subroutine call, initial reset, internal interrupt or return from subroutine, the PC manipulates the program transfer by loading the address corresponding to each instruction.

The conditional skip is activated by instruction. Once the condition is met, the next instruction, fetched during the current instruction execution, is discarded and a dummy cycle takes its place while the correct instruction is obtained.

The lower byte of the program counter (PCL) is a read/write register (06H). Moving data into the PCL performs a short jump. The destination must be within 256 locations.

When a control transfer takes place, an additional dummy cycle is required.

Execution Flow

Mode	Program Counter										
	*10	*9	*8	*7	*6	*5	*4	*3	*2	*1	*0
Initial Reset	0	0	0	0	0	0	0	0	0	0	0
Time Base Overflow	0	0	0	0	0	0	0	0	1	0	0
Timer Counter 0 Overflow	0	0	0	0	0	0	0	1	0	0	0
Timer Counter 1 Overflow	0	0	0	0	0	0	0	1	1	0	0
Skip	Program Counter+2										
Loading PCL	*10	*9	*8	@7	@6	@5	@4	@3	@2	@1	@0
Jump, Call Branch	#10	#9	#8	#7	#6	#5	#4	#3	#2	#1	#0
Return from Subroutine	S10	S9	S8	S7	S6	S5	S4	S3	S2	S1	S0

Program Counter

Note: *10~*0: Program counter bits

#10~#0: Instruction code bits

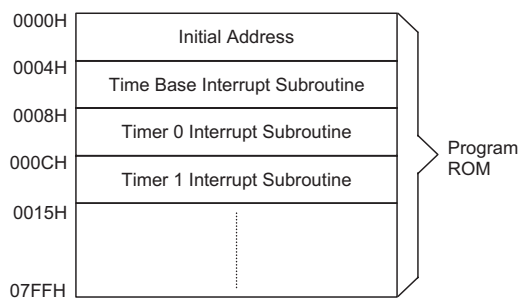

S10~S0: Stack register bits

@7~@0: PCL bits

Program Memory – ROM

The program memory stores the program instructions that are to be executed. It also includes data, table and interrupt entries, addressed by the program counter along with the table pointer. The program memory size for HT83R074 is 2048×15 bits. Certain locations in the program memory are reserved for special usage:

- Location 000H
This area is reserved for program initialization. The program always begins execution at location 000H each time the system is reset.
- Location 004H
This area is reserved for the time base interrupt service program. If the ETBI (intc.1) is activated, and the interrupt is enabled and the stack is not full, the program will jump to location 004H and begins execution.
- Location 008H
This area is reserved for the 8-bit Timer Counter 0 interrupt service program. If a timer interrupt results from a Timer Counter 0 overflow, and if the interrupt is enabled and the stack is not full, the program will jump to location 008H and begins execution.
- Location 00CH
This area is reserved for the 8-bit Timer Counter 1 interrupt service program. If a timer interrupt results from a Timer Counter 1 overflow, and if the interrupt is enabled and the stack is not full, the program will jump to location 00CH and begins execution.

Program Memory
Table Location

Any location in the ROM space can be used as look up tables. The instructions "TABRDC [m]" (used for any bank) and "TABRDL [m]" (only used for last page of program ROM) transfer the contents of the lower-order byte to the specified data memory [m], and the higher-order byte to TBLH (08H). Only the destination of the lower-order byte in the table is well-defined. The higher-order bytes of the table word are transferred to the TBLH. The table higher-order byte register (TBLH) is read only.

The table pointer (TBLP) is a read/write register, which indicates the table location.

Stack Register – Stack

The stack register is a special part of the memory used to save the contents of the Program Counter. This stack is organized into four levels. It is neither part of the data nor part of the program space, and cannot be read or written to. Its activated level is indexed by a Stack Pointer (SP) and cannot be read or written to. At a subroutine call or interrupt acknowledgment, the contents of the program counter are pushed onto the stack.

The program counter is restored to its previous value from the stack at the end of subroutine or interrupt routine, which is signaled by return instruction (RET or RETI). After a chip resets, SP will point to the top of the stack.

The interrupt request flag will be recorded but the acknowledgment will be inhibited when the stack is full and a non-masked interrupt takes place. After the stack pointer is decremented (by RET or RETI), the interrupt request will be serviced. This feature prevents stack overflow and allows programmers to use the structure more easily. In a similar case, if the stack is full and a "CALL" is subsequently executed, stack overflow occurs and the first entry is lost.

Instruction	Table Location										
	*10	*9	*8	*7	*6	*5	*4	*3	*2	*1	*0
TABRDC [m]	P10	P9	P8	@7	@6	@5	@4	@3	@2	@1	@0
TABRDL [m]	1	1	1	@7	@6	@5	@4	@3	@2	@1	@0

Table Location

Note: *10~*0: Current program ROM table

@7~@0: Write @7~@0 to TBLP pointer register

P10~P8: Bits of current program counter

Data Memory – RAM

The data memory is designed with 80×8 bits. The data memory is further divided into two functional groups, namely, special function registers (00H~2AH) and general purpose user data memory (30H~7FH). Although most of them can be read or be written to, some are read only.

The general purpose data memory, addressed from 30H~7FH, is used for data and control information under instruction commands.

The areas in the RAM can directly handle the arithmetic, logic, increment, decrement and rotate operations. Except some dedicated bits, each bit in the RAM can be set and reset by "SET [m].i" and "CLR [m].i". They are also indirectly accessible through the Memory Pointer register 0 (MP0:01H).

Indirect Addressing Register

Location 00H is indirect addressing registers that are not physically implemented. Any read/write operation of [00H] accesses the RAM pointed to by MP0 (01H) respectively. Reading location 00H indirectly returns the result 00H. While, writing it indirectly leads to no operation.

Accumulator – ACC (05H)

The accumulator (ACC) is related to the ALU operations. It is also mapped to location 05H of the RAM and is capable of operating with immediate data. The data movement between two data memory locations must pass through the ACC.

Arithmetic and Logic Unit – ALU

This circuit performs 8-bit arithmetic and logic operations and provides the following functions:

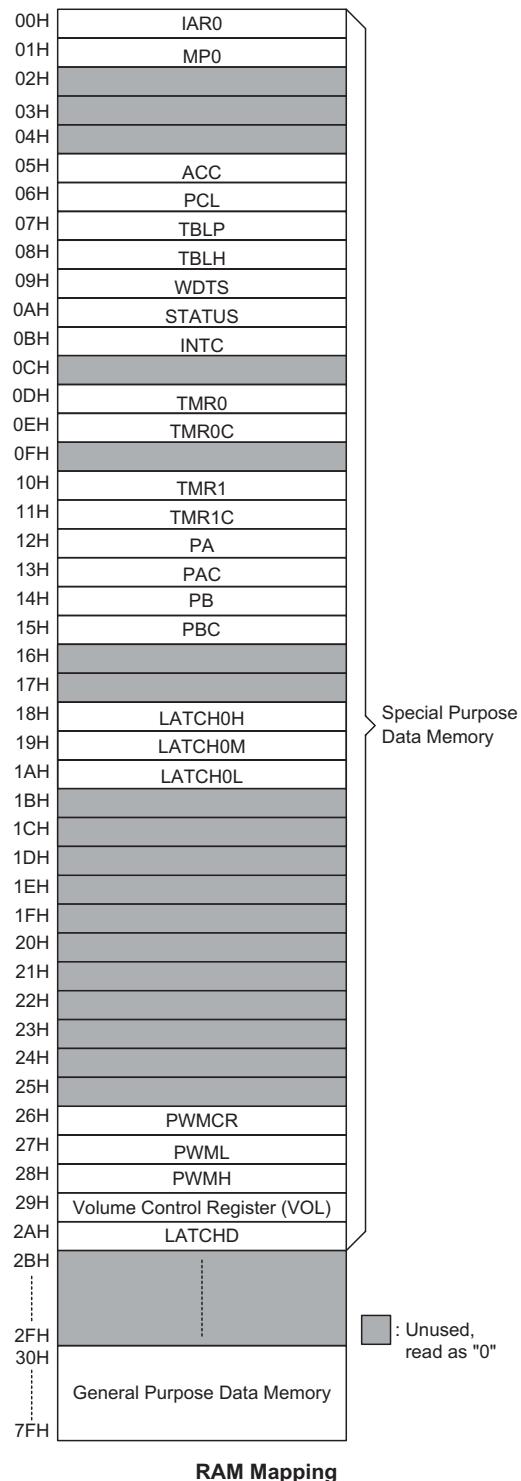

- Arithmetic operations (ADD, ADC, SUB, SBC, DAA)
- Logic operations (AND, OR, XOR, CPL)
- Rotation (RL, RR, RLC, RRC)
- Increment and Decrement (INC, DEC)
- Branch decision (SZ, SNZ, SIZ, SDZ etc)

Status Register – STATUS (0AH)

This 8-bit STATUS register (0AH) consists of a zero flag (Z), carry flag (C), auxiliary carry flag (AC), overflow flag (OV), power down flag (PDF), watchdog time-out flag (TO). It also records the status information and controls the operation sequence.

Except the TO and PDF flags, bits in the status register can be altered by instructions similar to other registers. Data written into the status register does not alter the TO or PDF flags. Operations related to the status register, however, may yield different results from those intended. The TO and PDF flags can only be changed by a Watchdog Timer overflow, chip power-up, or clearing the Watchdog Timer and executing the "HALT" instruction. The Z, OV, AC, and C flags reflect the status of the latest operations.

On entering the interrupt sequence or executing the subroutine call, the status register will not be automatically pushed onto the stack. If the contents of the status is important, and if the subroutine is likely to corrupt the status register, the programmer should take precautions and save it properly.

Address	RAM Mapping	Read/Write	Description
00H	IAR0	R/W	Indirect Addressing Register 0
01H	MP0	R/W	Memory Pointer 0
05H	ACC	R/W	Accumulator
06H	PCL	R/W	Program counter lower-order byte address
07H	TBLP	R/W	Table pointer lower-order byte register
08H	TBLH	R	Table higher-order byte content register
09H	WDTS	R/W	Watchdog Timer option setting register
0AH	STATUS	R/W	Status register
0BH	INTC	R/W	Interrupt control register 0
0DH	TMR0	R/W	Timer Counter 0 register
0EH	TMR0C	R/W	Timer Counter 0 control register
10H	TMR1	R/W	Timer Counter 1 register
11H	TMR1C	R/W	Timer Counter 1 control register
12H	PA	R/W	Port A I/O data register
13H	PAC	R/W	Port A I/O control register
14H	PB	R/W	Port B I/O data register
15H	PBC	R/W	Port B I/O control register
18H	LATCH0H	R/W	Voice ROM address latch 0 [A17, A16]
19H	LATCH0M	R/W	Voice ROM address latch 0 [A15~A8]
1AH	LATCH0L	R/W	Voice ROM address latch 0 [A7~A0]
26H	PWMCR	R/W	PWM control register
27H	PWML	R/W, higher-nibble available only	PWM output data P3~P0 to PWML7~PWML4
28H	PWMH	R/W	PWM output data P11~P4 to PWMH7~PWMH0
29H	VOL	R/W, higher-nibble available only	Volume control register and volume controlled by VOL8~VOL4
2AH	LATCHD	R	Voice ROM data register
2BH~2FH	Unused		
30H~7FH	User data RAM	R/W	User data RAM

Note: R: Read only
W: Write only
R/W: Read/Write

Interrupts

The HT83R074 provides two 8-bit programmable timer interrupts, and a time base interrupt. The Interrupt Control registers (INTC:0BH) contain the interrupt control bits to set to enable/disable and the interrupt request flags.

Once an interrupt subroutine is serviced, all other interrupts will be blocked (by clearing the EMI bit). This scheme may prevent any further interrupt nesting. Other interrupt requests may happen during this interval but only the interrupt request flag is recorded. If a certain interrupt needs servicing within the service routine, the EMI bit and the corresponding INTC bit may be set to al-

low interrupt nesting. If the stack is full, the interrupt request will not be acknowledged, even if the related interrupt is enabled, until the Stack Pointer is decremented. If immediate service is desired, the stack must be prevented from becoming full.

As an interrupt is serviced, a control transfer occurs by pushing the program counter onto the stack and then branching to subroutines at the specified location(s) in the program memory. Only the program counter is pushed onto the stack. The programmer must save the contents of the register or status register (STATUS) in advance if they are altered by an interrupt service program which corrupts the desired control sequence.

Bit No.	Label	Function
0	C	C is set if an operation results in a carry during an addition operation or if a borrow does not take place during a subtraction operation; otherwise C is cleared. C is also affected by a rotate through carry instruction.
1	AC	AC is set if an operation results in a carry out of the low nibbles in addition or no borrow from the high nibble into the low nibble in subtraction; otherwise AC is cleared.
2	Z	Z is set if the result of an arithmetic or logical operation is zero; otherwise Z is cleared.
3	OV	OV is set if an operation results in a carry into the highest-order bit but not a carry out of the highest-order bit, or vice versa; otherwise OV is cleared.
4	PDF	PDF is cleared by system power-up or executing the "CLR WDT" instruction. PDF is set by executing the "HALT" instruction.
5	TO	TO is cleared by system power-up or executing the "CLR WDT" or "HALT" instruction. TO is set by a WDT time-out.
6~7	—	Unused bit, read as "0"

Status (0AH) Register

The Internal Timer Counter 0 Interrupt is initialized by setting the Timer Counter 0 interrupt request flag (T0F:bit 5 of INTC), caused by a Timer Counter 0 overflow. When the interrupt is enabled, and the stack is not full and the T0F bit is set, a subroutine call to location 08H will occur. The related interrupt request flag (T0F) will be reset and the EMI bit cleared to disable further interrupts.

The Internal Timer Counter 1 Interrupt is initialized by setting the Timer Counter 1 interrupt request flag (T1F:bit 6 of INTC), caused by a Timer Counter 1 overflow. When the interrupt is enabled, and the stack is not full and the T1F bit is set, a subroutine call to location 0CH will occur. The related interrupt request flag (T1F) will be reset and the EMI bit cleared to disable further interrupts.

Time Base Interrupt is triggered by set INTC.1 (ETBI) which sets the related interrupt request flag (TBF:bit 4 of INTC). When the interrupt is enabled, and the stack is not full and the external interrupt is active, a subroutine call to location 04H will occur. The interrupt request flag (TBF) and EMI bits will be cleared to disable other interrupts.

During the execution of an interrupt subroutine, other interrupt acknowledgment are held until the "RETI" instruction is executed or the EMI bit and the related interrupt control bit are set to "1" (of course, if the stack is not full). To return from the interrupt subroutine, the "RET" or "RETI" instruction may be invoked. RETI will set the EMI bit to enable an interrupt service, but RET will not.

Interrupts occurring in the interval between the rising edges of two consecutive T2 pulses, will be serviced on the latter of the two T2 pulses, if the corresponding interrupts are enabled. In the case of simultaneous requests, the following table shows the priority that is applied. These can be masked by resetting the EMI bit.

The Timer Counter 0/1 interrupt request flag (T0F/T1F) which enables Timer Counter 0/1 control bit (ET0I/

ET1I), the time base interrupt request flag (TBF) which enables time base control bit (ETBI) from the interrupt control register (INTC:0BH) EMI, ETBI, ET0I, ET1I are used to control the enabling/disabling of interrupts. These bits prevent the requested interrupt begin serviced. Once the interrupt request flags (T0F, T1F, TBF) are set, they will remain in the INTC register until the interrupts are serviced or cleared by a software instruction.

It is recommended that application programs do not use CALL subroutines within an interrupt subroutine. Interrupts often occur in an unpredictable manner or need to be serviced immediately in some applications. If only one stack is left and the interrupt enable is not well controlled, once a CALL subroutine if used in the interrupt subroutine will corrupt the original control sequence.

Bit No.	Label	Function
0	EMI	Controls the master (global) interrupt (1= enabled; 0= disabled)
1	ETBI	Controls the time base interrupt (1= enabled; 0= disabled)
2	ET0I	Controls the timer 0 interrupt (1= enabled; 0= disabled)
3	ET1I	Controls the timer 1 interrupt (1= enabled; 0= disabled)
4	TBF	Time base interrupt request flag (1= active; 0= inactive)
5	T0F	Timer 0 request flag (1= active; 0= inactive)
6	T1F	Timer 1 request flag (1= active; 0= inactive)
7	—	Unused bit, read as "0"

INTC (0BH) Register

Interrupt Source	Priority	Vector
Time Base Interrupt	1	04H
Timer Counter 0 Overflow	2	08H
Timer Counter 1 Overflow	3	0CH

Oscillator Configuration

The HT83R074 provides two oscillator circuits for system clock, i.e., RC oscillator and Crystal oscillator. No matter what type of oscillator. The signal is used for the system clock. The HALT mode stops the system oscillator to conserve power. If the RC oscillator is used, an external resistor between OSC1 and VSS is required, and the range of the resistance should be from 144kΩ to 275kΩ. The system clock, divided by 4. The RC oscillator provides the most cost effective solution. However, the frequency of the oscillation may vary with VDD, temperature, and the chip itself due to process variations. It is therefore not suitable for timing sensitive operations where accurate oscillator frequency is desired.

On the other hand, if the crystal oscillator is selected, a crystal across OSC1 and OSC2 is needed to provide the feedback and phase shift required for the oscillator, and no other external components are required. A resonator may be connected between OSC1 and OSC2 to replace the crystal and to get a frequency reference, but two external capacitors in OSC1 and OSC2 are required.

System Oscillator

Watchdog Timer – WDT

The WDT clock source is implemented by a dedicated RC oscillator (WDT oscillator) or instruction clock (system clock divided by 4), decided by options. This timer is designed to prevent a software malfunction or sequence jumping to an unknown location with unpredictable results. The Watchdog Timer can be disabled by option. If the Watchdog Timer is disabled, all the executions related to the WDT result in no operation.

Once the internal WDT oscillator (RC oscillator with period 78μs normally) is selected, it is first divided by 256 (8-stages) to get the nominal time-out period of approximately 20ms. This time-out period may vary with temperature, VDD and process variations. By invoking the WDT prescaler, longer time-out period can be realized. Writing data to WS2, WS1, WS0 (bit 2,1,0 of WDTS(09H)) can give different time-out period.

If WS2, WS1, WS0 all equal to 1, the division ratio is up to 1:128, and the maximum time-out period is 2.6 seconds.

If the device operates in a noisy environment, using the on-chip RC oscillator (WDT OSC) is strongly recommended, since the HALT will stop the system clock.

The WDT overflow under normal operation will initialize a "chip reset" and set the status bit "TO". Whereas in the HALT mode, the overflow will initialize a "warm reset" only the Program Counter and SP are reset to zero. To clear the contents of the WDT (including the WDT prescaler), three methods are adopted; external reset (external reset (a low level to RES), software instructions, or a "HALT" instruction. The software instruction is "CLR WDT" and execution of the "CLR WDT" instruction will clear the WDT.

WS7	WS6	WS5	WS4	WS3	WS2	WS1	WS0	Division Ratio
—	—	—	—	—	0	0	0	1:1
—	—	—	—	—	0	0	1	1:2
—	—	—	—	—	0	1	0	1:4
—	—	—	—	—	0	1	1	1:8
—	—	—	—	—	1	0	0	1:16
—	—	—	—	—	1	0	1	1:32
—	—	—	—	—	1	1	0	1:64
—	—	—	—	—	1	1	1	1:128

WDTS (09H) Register

Watchdog Timer

Power Down – HALT

The HALT mode is initialized by a "HALT" instruction and results in the following:

- The system oscillator will be turned off but the WDT oscillator keeps running (if the WDT oscillator is selected).
- The contents of the on chip RAM and registers remain unchanged.
- WDT and WDT prescaler will be cleared and recount again.
- All I/O ports maintain their original status.
- The PDF flag is set and the TO flag is cleared.

The system can leave the HALT mode by means of an external reset, an interrupt, an external falling edge signal on port A or a WDT overflow. An external reset causes a device initialization and the WDT overflow performs a "warm reset". By examining the TO and PDF flags, the reason for the chip reset can be determined. The PDF flag is cleared when the system powers-up or executes the "CLR WDT" instruction, and is set when the "HALT" instruction is executed. The TO flag is set if a WDT time-out occurs, and causes a wake-up that only resets the Program Counter and Stack Pointer. The other maintain their original status.

The port A wake-up and interrupt methods can be considered as a continuation of normal execution. Each bit in port A can be independently selected to wake up the device by options. Awakening from an I/O port stimulus, the program will resume execution of the next instruction. If awakening from an interrupt, two sequence may occur. If the related interrupt is disabled or the interrupt is enabled by the stack is full, the program will resume execution at the next instruction. If the interrupt is enabled and the stack is not full, the regular interrupt response takes place.

Once a wake-up event occurs, it takes 1024 system clock period to resume normal operation. In other words, a dummy cycle period will be inserted after a wake-up. If the wake-up results from an interrupt acknowledge, the actual interrupt subroutine will be delayed by one more cycle. If the wake-up results in next instruction execution, this will be executed immediately after a dummy period is finished. If an interrupt request flag is set to "1" before entering the HALT mode, the wake-up function of the related interrupt will be dis-

abled. To minimize power consumption, all I/O pins should be carefully managed before entering the HALT status.

Reset

There are 3 ways in which a reset can occur:

- RES reset during normal operation
- RES reset during HALT
- WDT time-out reset during normal operation

The WDT time-out during HALT is different from other chip reset conditions, since it can perform a "warm re-set" that resets only the Program Counter and SP, leaving the other circuits in their original state. Some registers remain unchanged during any other reset conditions. Most registers are reset to their "initial condition" when the reset conditions are met. By examining the PDF flag and TO flag, the program can distinguish between different "chip resets".

TO	PDF	RESET Conditions
0	0	RES reset during power-up
u	u	RES reset during normal operation
0	1	RES wake-up HALT
1	u	WDT time-out during normal operation
1	1	WDT wake-up HALT

Note: "u" stands for "unchanged"

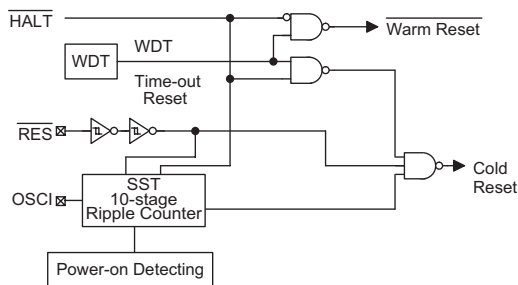

Reset Circuit

Reset Timing Chart

To guarantee that the system oscillator has started and stabilized, the SST (System Start-up Timer) provides an extra-delay of 1024 system clock pulses after a system power up or when awakening from a HALT state.

When a system power up occurs, the SST delay is added during the reset period. But when the reset comes from the RES pin, the SST delay is disabled. Any wake-up from HALT will enable the SST delay.

Reset Configuration

The functional unit chip reset status are shown below.

Program Counter	000H
Interrupt	Disable
Prescaler	Clear
WDT	Clear. After master reset, WDT begins counting
Timer Counter	Off
Input/Output Ports	Input mode
Stack Pointer	Points to the top of the stack

Timer Counter 0/1

The TMR0/TMR1 is internal clock source only, i.e. (TM1, TM0) = (0, 1). There is a 3-bit prescaler (TMRS2, TMRS1, TMRS0) which defines different division ratio of TMR0/TMR1's clock source.

Bit No.	Label	Function
0~2	TMRS2, TMRS1, TMRS0	Defines the operating clock source (TMRS2, TMRS1, TMRS0) 000: clock source/2 001: clock source/4 010: clock source/8 011: clock source/16 100: clock source/32 101: clock source/64 110: clock source/128 111: clock source/256
3	TE	Defines the TMR0/TMR1 active edge of Timer Counter
4	TON	Enable/disable timer counting (0=disabled; 1=enabled)
5	—	Unused bit, read as "0"
6	TM0, TM1	Defines the operating mode (TM1, TM0)
7		

TMR0C (0EH)/TMR1C (11H) Register

Note: TMR0C/TMR1C bit 3 always write "0"
 TMR0C/TMR1C bit 5 always write "0"
 TMR0C/TMR1C bit 6 always write "1"
 TMR0C/TMR1C bit 7 always write "0"

Timer Counter 0/1

The TMR0C is the Timer Counter 0 control register, which defines the Timer Counter 0 options. The Timer Counter 1 has the same options as the Timer Counter 0 and is defined by TMR1C.

To enable the counting operation, the Timer ON bit (TON; bit 4 of TMR0C/TMR1C) should be set to "1". The overflow of the timer counter is one of the wake-up sources. No matter what the operation mode is, writing a 0 to ET0/ET1 can disable the corresponding interrupt service.

The TMR0/1 is internal clock source only. There is a 3-bit prescaler (TMRS2, TMRS1, TMRS0) which defines different division ratio of TMR0/1's clock source.

Time Base

The time base enables the counting operation by INTC.1 (ETBI) bit. The overflow to interrupt as set INTC.4. The time base is internal clock source only. Time base of 1ms to overflow as system clock is 4MHz. Time base of 0.5ms to overflow as system clock is 8MHz.

Time Base

The registers states are summarized in the following table.

Register	Reset (Power-on)	WDT Time-out (Normal Operation)	RES Reset (Normal Operation)	RES Reset (HALT)	WDT Time-out (HALT)
MP0	xxxx xxxx	uuuu uuuu	uuuu uuuu	uuuu uuuu	uuuu uuuu

Note: "u" means "unchanged"
 "x" means "unknown"
 "--" means "undefined"

Input/Output Ports

There are 12 bidirectional input/output lines in the microcontroller, labeled from PA to PB, which are mapped to the data memory of [12H], [14H] respectively. All of these I/O ports can be used for input and output operations. For input operation, these ports are non-latching, that is, the inputs must be ready at the T2 rising edge of instruction "MOV A, [m]" (m=12H, 14H). For output operation, all the data is latched and remains unchanged until the output latch is rewritten.

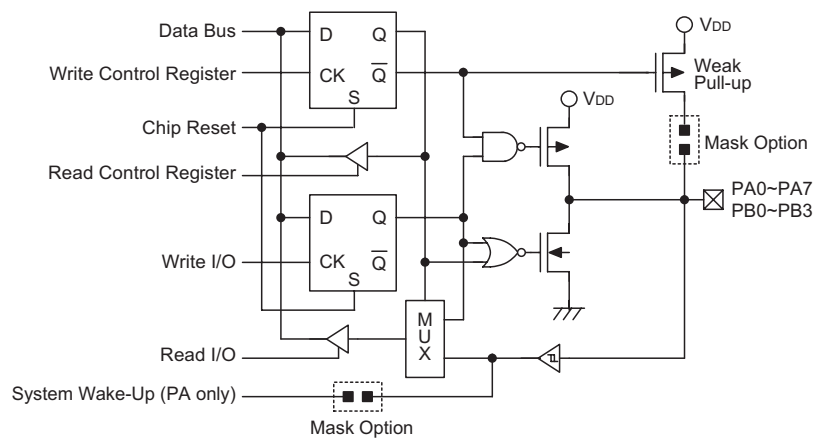

Each I/O line has its own control register (PAC, PBC) to control the input/output configuration. With this control register, CMOS output or Schmitt trigger input with or without pull-high resistor structures can be reconfigured dynamically under software control. To function as an input, the corresponding latch of the control register must write "1". The input source also depends on the control register. If the control register bit is "1", the input will read the pad state. If the control register bit is "0", the contents of the latches will move to the internal bus. The latter is possible in the "read-modify-write" instruction.

For output function, CMOS is the only configuration. These control registers are mapped to locations 13Hm 15H.

After a chip reset, these input/output lines remain at high levels or floating state (dependent on pull-high options). Each bit of these input/output latches can be set or cleared by "SET [m].i" and "CLR [m].i" (m=12H, 14H) instructions.

Some instructions first input data and then follow the output operations. For example, "SET [m].i", "CLR [m].i", "CPL [m]", "CPLA [m]" read the entire port states into the CPU, execute the defined operations (bit-operation), and then write the results back to the latches or the accumulator.

Each line of port A has the capability of waking-up the device. The wake-up capability of port A is determined by options. There is a pull-high option available for all I/O lines. Once the pull-high option is selected, all I/O lines have pull-high resistors. Otherwise, the pull-high resistors are absent. It should be noted that a non-pull-high I/O line operating in input mode will cause a floating state.

Input/Output Ports

Pulse Width Modulation Output – PWML/PWMH (27H/28H)

The HT83R074 provide one 12-bit PWM interface for driving an external 8Ω speaker. The programmer must write the voice data to register PWML/PWMH (27H/28H)

Pulse Width Modulation Control Register – PWMCR (26H)

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3 (R/W)	Bit 2 (R/W)	Bit 1	Bit 0 (R/W)
MSB_SIGN	—	—	—	Single_PWM	VROMC	—	PWMC

PWMC: Start bit of PWM output

- PWM start counter: 0 to 1
- PWM stop counter: 1 to 0

After waiting one cycle end , stop the PWM counter and keep in low signal

VROMC: Enable voice ROM power circuit (1=enable; 0=disable)

Single_PWM: Driving PWM single by PWM1 output (1=PWM1 output; 0=PWM1/PWM2 output)

The HT83R074 provide an 12-bit (bit 7 is a sign bit, if Single_PWM = 0) PWM interface. The PWM provides two pad outputs: PWM1, PWM2 which can directly drive a piezo or an 8Ω speaker without adding any external element (green mode), or using only port PWM1 (Set Single_PWM=1) to drive piezo or an 8Ω speaker with external element.

When Setting Single_PWM= 1, choose voice data7~data1 as the output data (no sign bit on it).

If the sign bit is 0, then the signal is output to PWM1 and the PWM2 will get a GND level voltage after setting start bit to 1. If the sign bit is 1, then the signal is output to PWM2 and the PWM1 will get a GND level voltage after setting start bit to 1.

PWM output Initial low level , and stop in low level

If PWMC from low to high then start PWM output latch new data , if no update then keep the old value.

If PWMC from high to low, in duty end, stop PWM output and stop the counter.

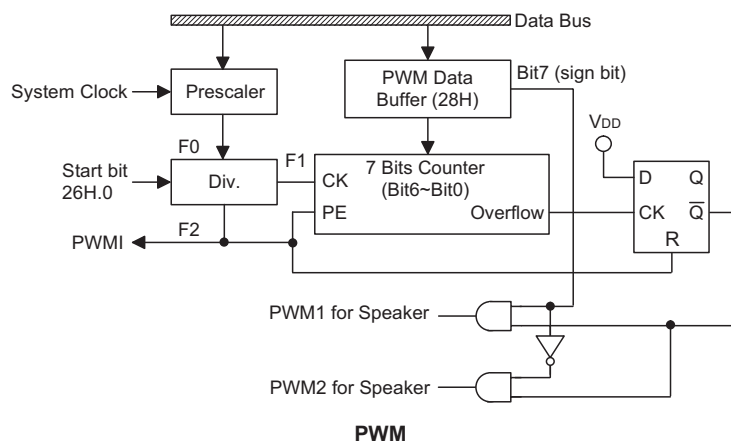

Voice ROM Data Address Latch Counter

The voice ROM data address latch counter is the hand-shaking between the microcontroller and voice ROM, where the voice codes are stored. One 8-bit of voice ROM data will be addressed by setting 18-bit address latch counter LATCH0H/LATCH0M/LATCH0L. After the 8-bit voice ROM data is addressed, a few instruction cycles (4μs at least) will be generated to latch the voice ROM data, then the microcontroller can read the voice data from LATCHD (2AH).

Example: Read an 8-bit voice ROM data which is located at address 000007H by address latch 0

```

set   [26H].2      ; Enable voice ROM circuit
mov   A, 07H       ;
mov   LATCH0L, A   ; Set LATCH0L to 07H
mov   A, 00H       ;
mov   LATCH0M, A   ; Set LATCH0M to 00H
mov   A, 00H       ;
mov   LATCH0H, A   ; Set LATCH0H to 00H
call  Delay Time   ; Delay a short period of time
mov   A, LATCHD    ; Get voice data at 000007H
    
```

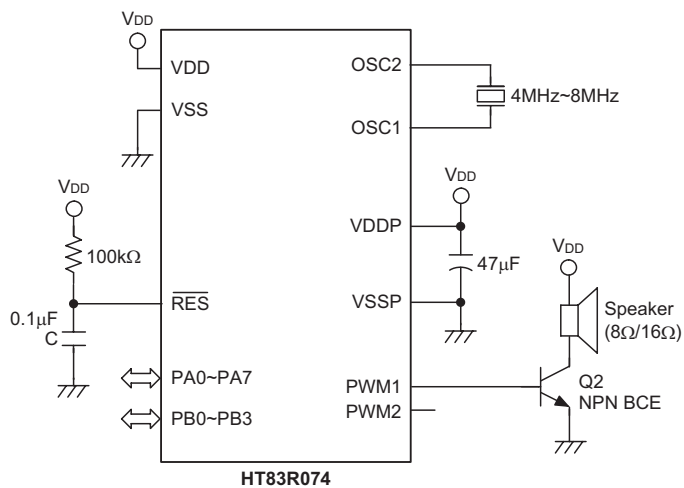

PWM

Option

Option	Description
PA Wake-up	Enable or disable PA wake-up function
Watchdog Timer (WDT)	Enable or disable WDT function. WDT clock source is from WDTOSC or T1
PA Pull-high	Enable or disable PA pull-high
PB Pull-high	Enable or disable PB pull-high
OSC Option	Crystal or Resistor type

f_{osc} – R_{osc} Table (V_{DD}=3V)

f _{osc}	R _{TYPICAL}
4MHz±10%	275kΩ
6MHz±10%	188kΩ
8MHz±10%	144kΩ

Application Circuits

Single PWM Mode

Instruction Set Summary

Mnemonic	Description	Instruction Cycle	Flag Affected
Arithmetic			
ADD A,[m]	Add data memory to ACC	1	Z,C,AC,OV
ADDM A,[m]	Add ACC to data memory	1 ⁽¹⁾	Z,C,AC,OV
ADD A,x	Add immediate data to ACC	1	Z,C,AC,OV
ADC A,[m]	Add data memory to ACC with carry	1	Z,C,AC,OV
ADCM A,[m]	Add ACC to data memory with carry	1 ⁽¹⁾	Z,C,AC,OV
SUB A,x	Subtract immediate data from ACC	1	Z,C,AC,OV
SUB A,[m]	Subtract data memory from ACC	1	Z,C,AC,OV
SUBM A,[m]	Subtract data memory from ACC with result in data memory	1 ⁽¹⁾	Z,C,AC,OV
SBC A,[m]	Subtract data memory from ACC with carry	1	Z,C,AC,OV
SBCM A,[m]	Subtract data memory from ACC with carry and result in data memory	1 ⁽¹⁾	Z,C,AC,OV
DAA [m]	Decimal adjust ACC for addition with result in data memory	1 ⁽¹⁾	C
Logic Operation			
AND A,[m]	AND data memory to ACC	1	Z
OR A,[m]	OR data memory to ACC	1	Z
XOR A,[m]	Exclusive-OR data memory to ACC	1	Z
ANDM A,[m]	AND ACC to data memory	1 ⁽¹⁾	Z
ORM A,[m]	OR ACC to data memory	1 ⁽¹⁾	Z
XORM A,[m]	Exclusive-OR ACC to data memory	1 ⁽¹⁾	Z
AND A,x	AND immediate data to ACC	1	Z
OR A,x	OR immediate data to ACC	1	Z
XOR A,x	Exclusive-OR immediate data to ACC	1	Z
CPL [m]	Complement data memory	1 ⁽¹⁾	Z
CPLA [m]	Complement data memory with result in ACC	1	Z
Increment & Decrement			
INCA [m]	Increment data memory with result in ACC	1	Z
INC [m]	Increment data memory	1 ⁽¹⁾	Z
DECA [m]	Decrement data memory with result in ACC	1	Z
DEC [m]	Decrement data memory	1 ⁽¹⁾	Z
Rotate			
RRA [m]	Rotate data memory right with result in ACC	1	None
RR [m]	Rotate data memory right	1 ⁽¹⁾	None
RRCA [m]	Rotate data memory right through carry with result in ACC	1	C
RRC [m]	Rotate data memory right through carry	1 ⁽¹⁾	C
RLA [m]	Rotate data memory left with result in ACC	1	None
RL [m]	Rotate data memory left	1 ⁽¹⁾	None
RLCA [m]	Rotate data memory left through carry with result in ACC	1	C
RLC [m]	Rotate data memory left through carry	1 ⁽¹⁾	C
Data Move			
MOV A,[m]	Move data memory to ACC	1	None
MOV [m],A	Move ACC to data memory	1 ⁽¹⁾	None
MOV A,x	Move immediate data to ACC	1	None
Bit Operation			
CLR [m].i	Clear bit of data memory	1 ⁽¹⁾	None
SET [m].i	Set bit of data memory	1 ⁽¹⁾	None

Mnemonic	Description	Instruction Cycle	Flag Affected
Branch			
JMP addr	Jump unconditionally	2	None
SZ [m]	Skip if data memory is zero	1 ⁽²⁾	None
SZA [m]	Skip if data memory is zero with data movement to ACC	1 ⁽²⁾	None
SZ [m].i	Skip if bit i of data memory is zero	1 ⁽²⁾	None
SNZ [m].i	Skip if bit i of data memory is not zero	1 ⁽²⁾	None
SIZ [m]	Skip if increment data memory is zero	1 ⁽³⁾	None
SDZ [m]	Skip if decrement data memory is zero	1 ⁽³⁾	None
SIZA [m]	Skip if increment data memory is zero with result in ACC	1 ⁽²⁾	None
SDZA [m]	Skip if decrement data memory is zero with result in ACC	1 ⁽²⁾	None
CALL addr	Subroutine call	2	None
RET	Return from subroutine	2	None
RET A,x	Return from subroutine and load immediate data to ACC	2	None
RETI	Return from interrupt	2	None
Table Read			
TABRDC [m]	Read ROM code (current page) to data memory and TBLH	2 ⁽¹⁾	None
TABRDL [m]	Read ROM code (last page) to data memory and TBLH	2 ⁽¹⁾	None
Miscellaneous			
NOP	No operation	1	None
CLR [m]	Clear data memory	1 ⁽¹⁾	None
SET [m]	Set data memory	1 ⁽¹⁾	None
CLR WDT	Clear Watchdog Timer	1	TO,PDF
CLR WDT1	Pre-clear Watchdog Timer	1	TO ⁽⁴⁾ ,PDF ⁽⁴⁾
CLR WDT2	Pre-clear Watchdog Timer	1	TO ⁽⁴⁾ ,PDF ⁽⁴⁾
SWAP [m]	Swap nibbles of data memory	1 ⁽¹⁾	None
SWAPA [m]	Swap nibbles of data memory with result in ACC	1	None
HALT	Enter power down mode	1	TO,PDF

Note: x: Immediate data

m: Data memory address

A: Accumulator

i: 0~7 number of bits

addr: Program memory address

√: Flag is affected

–: Flag is not affected

⁽¹⁾: If a loading to the PCL register occurs, the execution cycle of instructions will be delayed for one more cycle (four system clocks).

⁽²⁾: If a skipping to the next instruction occurs, the execution cycle of instructions will be delayed for one more cycle (four system clocks). Otherwise the original instruction cycle is unchanged.

⁽³⁾: ⁽¹⁾ and ⁽²⁾

⁽⁴⁾: The flags may be affected by the execution status. If the Watchdog Timer is cleared by executing the "CLR WDT1" or "CLR WDT2" instruction, the TO and PDF are cleared. Otherwise the TO and PDF flags remain unchanged.

Instruction Definition

ADC A,[m] Add data memory and carry to the accumulator
 Description The contents of the specified data memory, accumulator and the carry flag are added simultaneously, leaving the result in the accumulator.
 Operation $ACC \leftarrow ACC+[m]+C$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

ADCM A,[m] Add the accumulator and carry to data memory
 Description The contents of the specified data memory, accumulator and the carry flag are added simultaneously, leaving the result in the specified data memory.
 Operation $[m] \leftarrow ACC+[m]+C$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

ADD A,[m] Add data memory to the accumulator
 Description The contents of the specified data memory and the accumulator are added. The result is stored in the accumulator.
 Operation $ACC \leftarrow ACC+[m]$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

ADD A,x Add immediate data to the accumulator
 Description The contents of the accumulator and the specified data are added, leaving the result in the accumulator.
 Operation $ACC \leftarrow ACC+x$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

ADDM A,[m] Add the accumulator to the data memory
 Description The contents of the specified data memory and the accumulator are added. The result is stored in the data memory.
 Operation $[m] \leftarrow ACC+[m]$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

AND A,[m] Logical AND accumulator with data memory
 Description Data in the accumulator and the specified data memory perform a bitwise logical_AND operation. The result is stored in the accumulator.
 Operation $ACC \leftarrow ACC \text{ "AND" } [m]$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

AND A,x Logical AND immediate data to the accumulator
 Description Data in the accumulator and the specified data perform a bitwise logical_AND operation. The result is stored in the accumulator.
 Operation $ACC \leftarrow ACC \text{ "AND" } x$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

ANDM A,[m] Logical AND data memory with the accumulator
 Description Data in the specified data memory and the accumulator perform a bitwise logical_AND operation. The result is stored in the data memory.
 Operation $[m] \leftarrow ACC \text{ "AND" } [m]$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

CALL addr Subroutine call
 Description The instruction unconditionally calls a subroutine located at the indicated address. The program counter increments once to obtain the address of the next instruction, and pushes this onto the stack. The indicated address is then loaded. Program execution continues with the instruction at this address.
 Operation $Stack \leftarrow Program\ Counter + 1$
 $Program\ Counter \leftarrow addr$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

CLR [m] Clear data memory
 Description The contents of the specified data memory are cleared to 0.
 Operation $[m] \leftarrow 00H$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

CLR [m].i

Clear bit of data memory

Description

 The bit *i* of the specified data memory is cleared to 0.

Operation

 $[m].i \leftarrow 0$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

CLR WDT

Clear Watchdog Timer

Description

The WDT is cleared (clears the WDT). The power down bit (PDF) and time-out bit (TO) are cleared.

Operation

 $WDT \leftarrow 00H$
 $PDF \text{ and } TO \leftarrow 0$

Affected flag(s)

TO	PDF	OV	Z	AC	C
0	0	—	—	—	—

CLR WDT1

Preclear Watchdog Timer

Description

Together with CLR WDT2, clears the WDT. PDF and TO are also cleared. Only execution of this instruction without the other preclear instruction just sets the indicated flag which implies this instruction has been executed and the TO and PDF flags remain unchanged.

Operation

 $WDT \leftarrow 00H^*$
 $PDF \text{ and } TO \leftarrow 0^*$

Affected flag(s)

TO	PDF	OV	Z	AC	C
0*	0*	—	—	—	—

CLR WDT2

Preclear Watchdog Timer

Description

Together with CLR WDT1, clears the WDT. PDF and TO are also cleared. Only execution of this instruction without the other preclear instruction, sets the indicated flag which implies this instruction has been executed and the TO and PDF flags remain unchanged.

Operation

 $WDT \leftarrow 00H^*$
 $PDF \text{ and } TO \leftarrow 0^*$

Affected flag(s)

TO	PDF	OV	Z	AC	C
0*	0*	—	—	—	—

CPL [m]

Complement data memory

Description

Each bit of the specified data memory is logically complemented (1's complement). Bits which previously contained a 1 are changed to 0 and vice-versa.

Operation

 $[m] \leftarrow \overline{[m]}$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

CPLA [m] Complement data memory and place result in the accumulator

Description Each bit of the specified data memory is logically complemented (1's complement). Bits which previously contained a 1 are changed to 0 and vice-versa. The complemented result is stored in the accumulator and the contents of the data memory remain unchanged.

Operation $ACC \leftarrow \overline{[m]}$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

DAA [m] Decimal-Adjust accumulator for addition

Description The accumulator value is adjusted to the BCD (Binary Coded Decimal) code. The accumulator is divided into two nibbles. Each nibble is adjusted to the BCD code and an internal carry (AC1) will be done if the low nibble of the accumulator is greater than 9. The BCD adjustment is done by adding 6 to the original value if the original value is greater than 9 or a carry (AC or C) is set; otherwise the original value remains unchanged. The result is stored in the data memory and only the carry flag (C) may be affected.

Operation

If $ACC.3 \sim ACC.0 > 9$ or $AC=1$
then $[m].3 \sim [m].0 \leftarrow (ACC.3 \sim ACC.0) + 6$, $AC1 = \overline{AC}$
else $[m].3 \sim [m].0 \leftarrow (ACC.3 \sim ACC.0)$, $AC1 = 0$
and
If $ACC.7 \sim ACC.4 + AC1 > 9$ or $C=1$
then $[m].7 \sim [m].4 \leftarrow ACC.7 \sim ACC.4 + 6 + AC1$, $C=1$
else $[m].7 \sim [m].4 \leftarrow ACC.7 \sim ACC.4 + AC1$, $C=C$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	√

DEC [m] Decrement data memory

Description Data in the specified data memory is decremented by 1.

Operation $[m] \leftarrow [m] - 1$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

DECA [m] Decrement data memory and place result in the accumulator

Description Data in the specified data memory is decremented by 1, leaving the result in the accumulator. The contents of the data memory remain unchanged.

Operation $ACC \leftarrow [m] - 1$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

HALT Enter power down mode

Description This instruction stops program execution and turns off the system clock. The contents of the RAM and registers are retained. The WDT and prescaler are cleared. The power down bit (PDF) is set and the WDT time-out bit (TO) is cleared.

Operation Program Counter \leftarrow Program Counter+1
 PDF \leftarrow 1
 TO \leftarrow 0

Affected flag(s)

TO	PDF	OV	Z	AC	C
0	1	—	—	—	—

INC [m] Increment data memory

Description Data in the specified data memory is incremented by 1

Operation [m] \leftarrow [m]+1

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

INCA [m] Increment data memory and place result in the accumulator

Description Data in the specified data memory is incremented by 1, leaving the result in the accumulator. The contents of the data memory remain unchanged.

Operation ACC \leftarrow [m]+1

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

JMP addr Directly jump

Description The program counter are replaced with the directly-specified address unconditionally, and control is passed to this destination.

 Operation Program Counter \leftarrow addr

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

MOV A,[m] Move data memory to the accumulator

Description The contents of the specified data memory are copied to the accumulator.

Operation ACC \leftarrow [m]

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

MOV A,x

Move immediate data to the accumulator

Description

The 8-bit data specified by the code is loaded into the accumulator.

Operation

 $ACC \leftarrow x$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

MOV [m],A

Move the accumulator to data memory

Description

The contents of the accumulator are copied to the specified data memory (one of the data memories).

Operation

 $[m] \leftarrow ACC$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

NOF

No operation

Description

No operation is performed. Execution continues with the next instruction.

Operation

 $Program\ Counter \leftarrow Program\ Counter + 1$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

OR A,[m]

Logical OR accumulator with data memory

Description

Data in the accumulator and the specified data memory (one of the data memories) perform a bitwise logical_OR operation. The result is stored in the accumulator.

Operation

 $ACC \leftarrow ACC \text{ "OR" } [m]$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

OR A,x

Logical OR immediate data to the accumulator

Description

Data in the accumulator and the specified data perform a bitwise logical_OR operation. The result is stored in the accumulator.

Operation

 $ACC \leftarrow ACC \text{ "OR" } x$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

ORM A,[m]

Logical OR data memory with the accumulator

Description

Data in the data memory (one of the data memories) and the accumulator perform a bitwise logical_OR operation. The result is stored in the data memory.

Operation

 $[m] \leftarrow ACC \text{ "OR" } [m]$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

RET Return from subroutine
 Description The program counter is restored from the stack. This is a 2-cycle instruction.
 Operation Program Counter \leftarrow Stack
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

RET A,x Return and place immediate data in the accumulator
 Description The program counter is restored from the stack and the accumulator loaded with the specified 8-bit immediate data.
 Operation Program Counter \leftarrow Stack
 ACC \leftarrow x
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

RETI Return from interrupt
 Description The program counter is restored from the stack, and interrupts are enabled by setting the EMI bit. EMI is the enable master (global) interrupt bit.
 Operation Program Counter \leftarrow Stack
 EMI \leftarrow 1
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

RL [m] Rotate data memory left
 Description The contents of the specified data memory are rotated 1 bit left with bit 7 rotated into bit 0.
 Operation [m].(i+1) \leftarrow [m].i; [m].i:bit i of the data memory (i=0~6)
 [m].0 \leftarrow [m].7
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

RLA [m] Rotate data memory left and place result in the accumulator
 Description Data in the specified data memory is rotated 1 bit left with bit 7 rotated into bit 0, leaving the rotated result in the accumulator. The contents of the data memory remain unchanged.
 Operation ACC.(i+1) \leftarrow [m].i; [m].i:bit i of the data memory (i=0~6)
 ACC.0 \leftarrow [m].7
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

RLC [m] Rotate data memory left through carry

Description The contents of the specified data memory and the carry flag are rotated 1 bit left. Bit 7 replaces the carry bit; the original carry flag is rotated into the bit 0 position.

Operation $[m].(i+1) \leftarrow [m].i$; $[m].i$:bit i of the data memory (i=0~6)
 $[m].0 \leftarrow C$
 $C \leftarrow [m].7$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	√

RLCA [m] Rotate left through carry and place result in the accumulator

Description Data in the specified data memory and the carry flag are rotated 1 bit left. Bit 7 replaces the carry bit and the original carry flag is rotated into bit 0 position. The rotated result is stored in the accumulator but the contents of the data memory remain unchanged.

Operation $ACC.(i+1) \leftarrow [m].i$; $[m].i$:bit i of the data memory (i=0~6)
 $ACC.0 \leftarrow C$
 $C \leftarrow [m].7$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	√

RR [m] Rotate data memory right

Description The contents of the specified data memory are rotated 1 bit right with bit 0 rotated to bit 7.

Operation $[m].i \leftarrow [m].(i+1)$; $[m].i$:bit i of the data memory (i=0~6)
 $[m].7 \leftarrow [m].0$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

RRA [m] Rotate right and place result in the accumulator

Description Data in the specified data memory is rotated 1 bit right with bit 0 rotated into bit 7, leaving the rotated result in the accumulator. The contents of the data memory remain unchanged.

Operation $ACC.(i) \leftarrow [m].(i+1)$; $[m].i$:bit i of the data memory (i=0~6)
 $ACC.7 \leftarrow [m].0$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

RRC [m] Rotate data memory right through carry

Description The contents of the specified data memory and the carry flag are together rotated 1 bit right. Bit 0 replaces the carry bit; the original carry flag is rotated into the bit 7 position.

Operation $[m].i \leftarrow [m].(i+1)$; $[m].i$:bit i of the data memory (i=0~6)
 $[m].7 \leftarrow C$
 $C \leftarrow [m].0$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	√

RRCA [m] Rotate right through carry and place result in the accumulator

Description Data of the specified data memory and the carry flag are rotated 1 bit right. Bit 0 replaces the carry bit and the original carry flag is rotated into the bit 7 position. The rotated result is stored in the accumulator. The contents of the data memory remain unchanged.

Operation $ACC.i \leftarrow [m].(i+1)$; $[m].i$:bit i of the data memory ($i=0\sim 6$)
 $ACC.7 \leftarrow C$
 $C \leftarrow [m].0$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	√

SBC A,[m] Subtract data memory and carry from the accumulator

Description The contents of the specified data memory and the complement of the carry flag are subtracted from the accumulator, leaving the result in the accumulator.

Operation $ACC \leftarrow ACC + \overline{[m]} + C$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

SBCM A,[m] Subtract data memory and carry from the accumulator

Description The contents of the specified data memory and the complement of the carry flag are subtracted from the accumulator, leaving the result in the data memory.

Operation $[m] \leftarrow ACC + \overline{[m]} + C$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

SDZ [m] Skip if decrement data memory is 0

Description The contents of the specified data memory are decremented by 1. If the result is 0, the next instruction is skipped. If the result is 0, the following instruction, fetched during the current instruction execution, is discarded and a dummy cycle is replaced to get the proper instruction (2 cycles). Otherwise proceed with the next instruction (1 cycle).

Operation Skip if $([m]-1)=0$, $[m] \leftarrow ([m]-1)$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SDZA [m] Decrement data memory and place result in ACC, skip if 0

Description The contents of the specified data memory are decremented by 1. If the result is 0, the next instruction is skipped. The result is stored in the accumulator but the data memory remains unchanged. If the result is 0, the following instruction, fetched during the current instruction execution, is discarded and a dummy cycle is replaced to get the proper instruction (2 cycles). Otherwise proceed with the next instruction (1 cycle).

Operation Skip if $([m]-1)=0$, $ACC \leftarrow ([m]-1)$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SET [m] Set data memory
 Description Each bit of the specified data memory is set to 1.
 Operation $[m] \leftarrow FFH$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SET [m]. i Set bit of data memory
 Description Bit i of the specified data memory is set to 1.
 Operation $[m].i \leftarrow 1$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SIZ [m] Skip if increment data memory is 0
 Description The contents of the specified data memory are incremented by 1. If the result is 0, the following instruction, fetched during the current instruction execution, is discarded and a dummy cycle is replaced to get the proper instruction (2 cycles). Otherwise proceed with the next instruction (1 cycle).
 Operation Skip if $([m]+1)=0$, $[m] \leftarrow ([m]+1)$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SIZA [m] Increment data memory and place result in ACC, skip if 0
 Description The contents of the specified data memory are incremented by 1. If the result is 0, the next instruction is skipped and the result is stored in the accumulator. The data memory remains unchanged. If the result is 0, the following instruction, fetched during the current instruction execution, is discarded and a dummy cycle is replaced to get the proper instruction (2 cycles). Otherwise proceed with the next instruction (1 cycle).
 Operation Skip if $([m]+1)=0$, $ACC \leftarrow ([m]+1)$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SNZ [m].i Skip if bit i of the data memory is not 0
 Description If bit i of the specified data memory is not 0, the next instruction is skipped. If bit i of the data memory is not 0, the following instruction, fetched during the current instruction execution, is discarded and a dummy cycle is replaced to get the proper instruction (2 cycles). Otherwise proceed with the next instruction (1 cycle).
 Operation Skip if $[m].i \neq 0$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SUB A,[m] Subtract data memory from the accumulator
 Description The specified data memory is subtracted from the contents of the accumulator, leaving the result in the accumulator.
 Operation $ACC \leftarrow ACC + \overline{[m]} + 1$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

SUBM A,[m] Subtract data memory from the accumulator
 Description The specified data memory is subtracted from the contents of the accumulator, leaving the result in the data memory.
 Operation $[m] \leftarrow ACC + \overline{[m]} + 1$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

SUB A,x Subtract immediate data from the accumulator
 Description The immediate data specified by the code is subtracted from the contents of the accumulator, leaving the result in the accumulator.
 Operation $ACC \leftarrow ACC + \overline{x} + 1$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	√	√	√	√

SWAP [m] Swap nibbles within the data memory
 Description The low-order and high-order nibbles of the specified data memory (1 of the data memories) are interchanged.
 Operation $[m].3 \sim [m].0 \leftrightarrow [m].7 \sim [m].4$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SWAPA [m] Swap data memory and place result in the accumulator
 Description The low-order and high-order nibbles of the specified data memory are interchanged, writing the result to the accumulator. The contents of the data memory remain unchanged.
 Operation $ACC.3 \sim ACC.0 \leftarrow [m].7 \sim [m].4$
 $ACC.7 \sim ACC.4 \leftarrow [m].3 \sim [m].0$
 Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SZ [m] Skip if data memory is 0

Description If the contents of the specified data memory are 0, the following instruction, fetched during the current instruction execution, is discarded and a dummy cycle is replaced to get the proper instruction (2 cycles). Otherwise proceed with the next instruction (1 cycle).

Operation Skip if [m]=0

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SZA [m] Move data memory to ACC, skip if 0

Description The contents of the specified data memory are copied to the accumulator. If the contents is 0, the following instruction, fetched during the current instruction execution, is discarded and a dummy cycle is replaced to get the proper instruction (2 cycles). Otherwise proceed with the next instruction (1 cycle).

Operation Skip if [m]=0

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

SZ [m].i Skip if bit i of the data memory is 0

Description If bit i of the specified data memory is 0, the following instruction, fetched during the current instruction execution, is discarded and a dummy cycle is replaced to get the proper instruction (2 cycles). Otherwise proceed with the next instruction (1 cycle).

Operation Skip if [m].i=0

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

TABRDC [m] Move the ROM code (current page) to TBLH and data memory

Description The low byte of ROM code (current page) addressed by the table pointer (TBLP) is moved to the specified data memory and the high byte transferred to TBLH directly.

Operation [m] ← ROM code (low byte)
TBLH ← ROM code (high byte)

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

TABRDL [m] Move the ROM code (last page) to TBLH and data memory

Description The low byte of ROM code (last page) addressed by the table pointer (TBLP) is moved to the data memory and the high byte transferred to TBLH directly.

Operation [m] ← ROM code (low byte)
TBLH ← ROM code (high byte)

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	—	—	—

XOR A,[m] Logical XOR accumulator with data memory

Description Data in the accumulator and the indicated data memory perform a bitwise logical Exclusive_OR operation and the result is stored in the accumulator.

Operation $ACC \leftarrow ACC \text{ "XOR" } [m]$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

XORM A,[m] Logical XOR data memory with the accumulator

Description Data in the indicated data memory and the accumulator perform a bitwise logical Exclusive_OR operation. The result is stored in the data memory. The 0 flag is affected.

Operation $[m] \leftarrow ACC \text{ "XOR" } [m]$

Affected flag(s)

TO	PDF	OV	Z	AC	C
—	—	—	√	—	—

XOR A,x Logical XOR immediate data to the accumulator

Description Data in the accumulator and the specified data perform a bitwise logical Exclusive_OR operation. The result is stored in the accumulator. The 0 flag is affected.

Operation $ACC \leftarrow ACC \text{ "XOR" } x$

Affected flag(s)
