Document Title

64K x 16 bit Dynamic RAM with EDO Page Mode

Revision History

Revision No	History	Draft Date	Remark
0A	Initial Draft	November 15,2001	

64K x 16 (1-MBIT) DYNAMIC RAM WITH EDO PAGE MODE

FEATURES

- Extended Data-Out (EDO) Page Mode access cycle
- TTL compatible inputs and outputs; tristate I/O
- Refresh Interval: 256 cycles /4 ms
- Refresh Mode: $\overline{RAS}$-Only, $\overline{CAS}$-before-$\overline{RAS}$ (CBR), Hidden
- Single power supply:
  5V ± 10% (IC41C1664)
  3.3V ± 10% (IC41LV1664)
- Byte Write and Byte Read operation via two $\overline{CAS}$
- Industrail Temperature Range -40°C to 85°C

DESCRIPTION

The *ICSI* IC41C1664 and IC41LV1664 is a 65,536 x 16-bit high-performance CMOS Dynamic Random Access Memories. The IC41C1664 offer an accelerated cycle access called EDO Page Mode. EDO Page Mode allows 256 random accesses within a single row with access cycle time as short as 10 ns per 16-bit word. The Byte Write control, of upper and lower byte, makes the IC41C1664 ideal for use in 16-, 32-bit wide data bus systems.

These features make the IC41C1664 and IC41LV1664 ideally suited for high-bandwidth graphics, digital signal processing, high-performance computing systems, and peripheral applications.

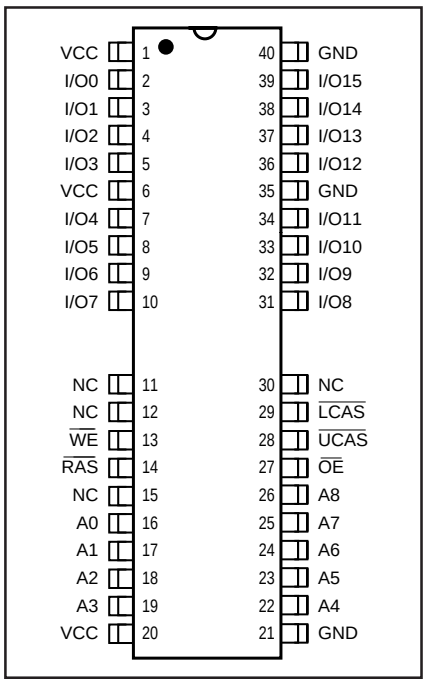
The IC41C1664 is packaged in a 40-pin 400mil SOJ and 400mil TSOP-2.

KEY TIMING PARAMETERS

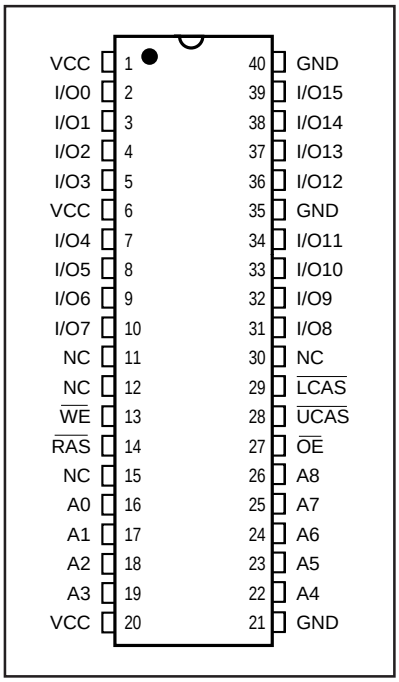
Parameter	-25	-30	-35	-40	Unit
Max. $\overline{RAS}$ Access Time (t_{RAC})	25	30	35	40	ns
Max. $\overline{CAS}$ Access Time (t_{CAC})	8	9	10	11	ns
Max. Column Address Access Time (t_{AA})	12	16	18	20	ns
Min. EDO Page Mode Cycle Time (t_{PC})	15	20	23	25	ns
Min. Read/Write Cycle Time (t_{RC})	43	55	65	75	ns

PIN CONFIGURATIONS

40-Pin TSOP-2



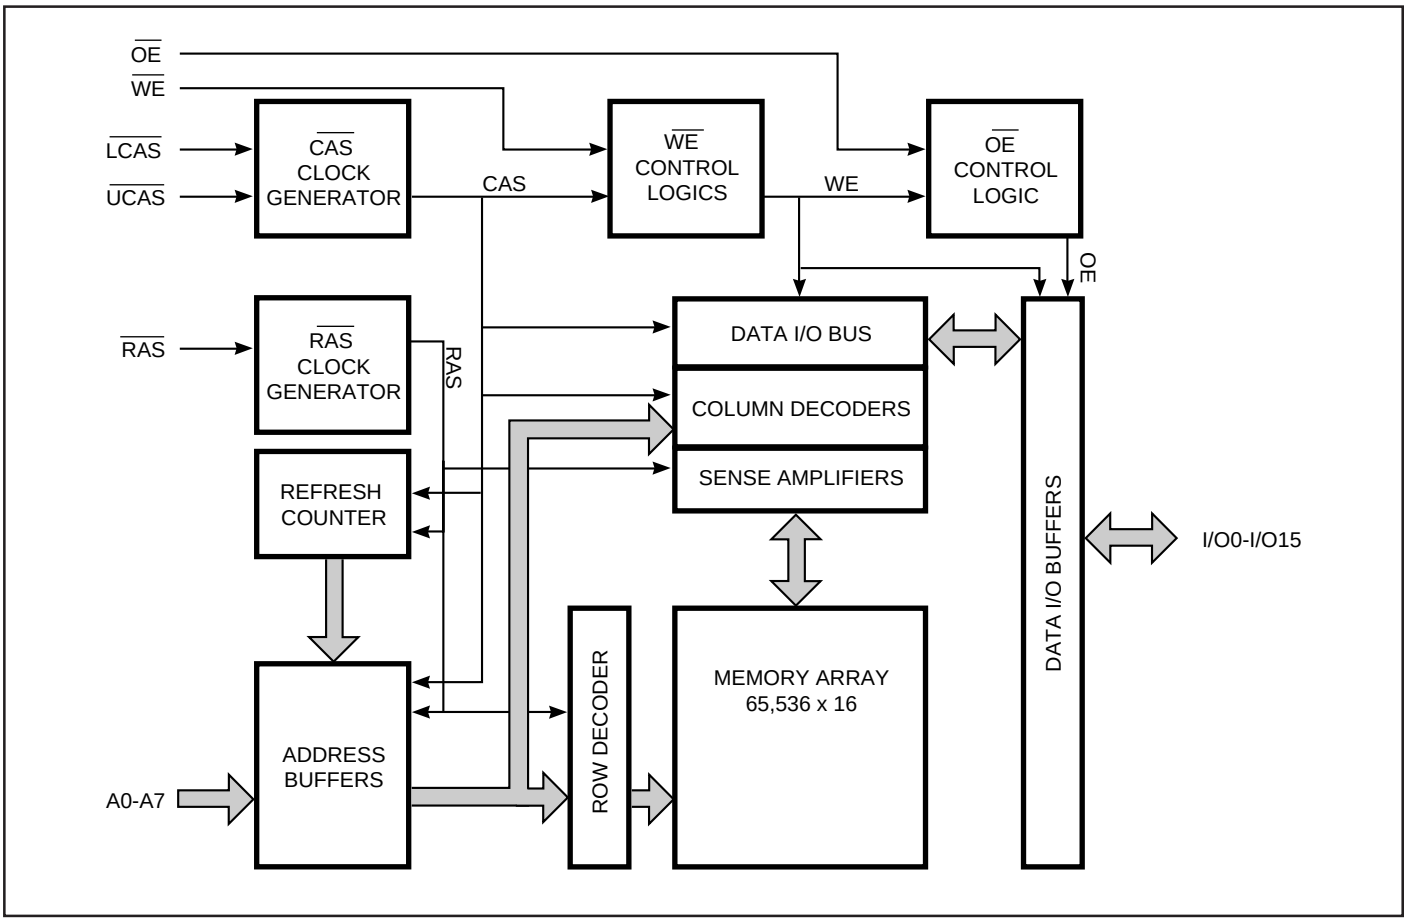
40-Pin SOJ



PIN DESCRIPTIONS

A0-A7	Address Inputs
I/O0-15	Data Inputs/Outputs
$\overline{WE}$	Write Enable
$\overline{OE}$	Output Enable
$\overline{RAS}$	Row Address Strobe
$\overline{UCAS}$	Upper Column Address Strobe
$\overline{LCAS}$	Lower Column Address Strobe
Vcc	Power
GND	Ground
NC	No Connection

FUNCTIONAL BLOCK DIAGRAM



TRUTH TABLE

Function		$\overline{RAS}$	$\overline{LCAS}$	$\overline{UCAS}$	$\overline{WE}$	$\overline{OE}$	Address tR/tC	I/O

$\overline{RAS}$-Only Refresh		L	H	H	X	X	ROW/NA	High-Z
CBR Refresh[3]		H→L	L	L	X	X	X	High-Z

Notes:
1. These WRITE cycles may also be BYTE WRITE cycles (either $\overline{LCAS}$ or $\overline{UCAS}$ active).
2. These READ cycles may also be BYTE READ cycles (either $\overline{LCAS}$ or $\overline{UCAS}$ active).
3. At least one of the two $\overline{CAS}$ signals must be active ($\overline{LCAS}$ or $\overline{UCAS}$).

Functional Description

The IC41C1664 and IC41LV1664 is a CMOS DRAM optimized for high-speed bandwidth, low power applications. During READ or WRITE cycles, each bit is uniquely addressed through the 16 address bits. These are entered 8 bits (A0-A7) at a time. The row address is latched by the Row Address Strobe ($\overline{RAS}$). The column address is latched by the Column Address Strobe ($\overline{CAS}$) .

The IC41C1664 and IC41LV1664 has two $\overline{CAS}$ controls, $\overline{LCAS}$ and $\overline{UCAS}$. The $\overline{LCAS}$ and $\overline{UCAS}$ inputs internally generates a $\overline{CAS}$ signal functioning in an identical manner to the single $\overline{CAS}$ input on the other 64K x 16 DRAMs. The key difference is that each $\overline{CAS}$ controls its corresponding I/O tristate logic (in conjunction with $\overline{OE}$ and $\overline{WE}$ and $\overline{RAS}$). $\overline{LCAS}$ controls I/O0 through I/O7 and $\overline{UCAS}$ controls I/O8 through I/O15.

The IC41C1664 and IC41LV1664 $\overline{CAS}$ function is determined by the first $\overline{CAS}$ ($\overline{LCAS}$ or $\overline{UCAS}$) transitioning LOW and the last transitioning back HIGH. The two $\overline{CAS}$ controls give the IC41C1664 both BYTE READ and BYTE WRITE cycle capabilities.

Memory Cycle

A memory cycle is initiated by bring $\overline{RAS}$ LOW and it is terminated by returning both $\overline{RAS}$ and $\overline{CAS}$ HIGH. To ensures proper device operation and data integrity any memory cycle, once initiated, must not be ended or aborted before the minimum t_{RAS} time has expired. A new cycle must not be initiated until the minimum precharge time t_{RP}, t_{CP} has elapsed.

Read Cycle

A read cycle is initiated by the falling edge of $\overline{CAS}$ or $\overline{OE}$, whichever occurs last, while holding $\overline{WE}$ HIGH. The column address must be held for a minimum time specified by t_{AR}. Data Out becomes valid only when t_{RAC}, t_{AA}, t_{CAC} and t_{OE} are all satisfied. As a result, the access time is dependent on the timing relationships between these parameters.

Write Cycle

A write cycle is initiated by the falling edge of $\overline{CAS}$ and $\overline{WE}$, whichever occurs last. The input data must be valid at or before the falling edge of $\overline{CAS}$ or $\overline{WE}$, whichever occurs first.

Refresh Cycle

To retain data, 256 refresh cycles are required in each 4 ms period. There are two ways to refresh the memory.

1. By clocking each of the 256 row addresses (A0 through A7) with $\overline{RAS}$ at least once every 4 ms. Any read, write, read-modify-write or $\overline{RAS}$-only cycle refreshes the addressed row.
2. Using a $\overline{CAS}$-before-$\overline{RAS}$ refresh cycle. $\overline{CAS}$-before-$\overline{RAS}$ refresh is activated by the falling edge of $\overline{RAS}$, while holding $\overline{CAS}$ LOW. In $\overline{CAS}$-before-$\overline{RAS}$ refresh cycle, an internal 8-bit counter provides the row addresses and the external address inputs are ignored.

$\overline{CAS}$-before-$\overline{RAS}$ is a refresh-only mode and no data access or device selection is allowed. Thus, the output remains in the High-Z state during the cycle.

Extended Data Out Page Mode

EDO page mode operation permits all 256 columns within a selected row to be randomly accessed at a high data rate.

In EDO page mode read cycle, the data-out is held to the next $\overline{CAS}$ cycle's falling edge, instead of the rising edge. For this reason, the valid data output time in EDO page mode is extended compared with the fast page mode. In the fast page mode, the valid data output time becomes shorter as the $\overline{CAS}$ cycle time becomes shorter. Therefore, in EDO page mode, the timing margin in read cycle is larger than that of the fast page mode even if the $\overline{CAS}$ cycle time becomes shorter.

In EDO page mode, due to the extended data function, the $\overline{CAS}$ cycle time can be shorter than in the fast page mode if the timing margin is the same.

The EDO page mode allows both read and write operations during one $\overline{RAS}$ cycle, but the performance is equivalent to that of the fast page mode in that case.

Power-On

After application of the V_{CC} supply, an initial pause of 200 µs is required followed by a minimum of eight initialization cycles (any combination of cycles containing a $\overline{RAS}$ signal).

During power-on, it is recommended that $\overline{RAS}$ track with V_{CC} or be held at a valid V_{IH} to avoid current surges.

ABSOLUTE MAXIMUM RATINGS[1]

Symbol	Parameters		Rating	Unit
V_T	Voltage on Any Pin Relative to GND	5V	–1.0 to +7.0	V
		3.3V	–0.5 to +4.6	
V_{CC}	Supply Voltage	5V	–1.0 to +7.0	V
		3.3V	–0.5 to +4.6	
I_{OUT}	Output Current		50	mA
P_D	Power Dissipation		1	W
T_A	Commercial Operation Temperature		0 to +70	°C
	Industrial Operationg Temperature		–40 to +85	°C
T_{STG}	Storage Temperature		–55 to +125	°C

Note:
1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

RECOMMENDED OPERATING CONDITIONS (Voltages are referenced to GND.)

Symbol	Parameter		Min.	Typ.	Max.	Unit
V_{CC}	Supply Voltage	5V	4.5	5.0	5.5	V
		3.3V	3.0	3.3	3.6	
V_{IH}	Input High Voltage	5V	2.4	—	V_{CC} + 1.0	V
		3.3V	2.0	—	V_{CC} + 0.3	
V_{IL}	Input Low Voltage	5V	–1.0	—	0.8	V
		3.3V	–0.3	—	0.8	
T_A	Commercial Ambient Temperature		0	—	70	°C
	Industrial Ambient Temperature		–40	—	85	°C

CAPACITANCE[1,2]

Symbol	Parameter	Max.	Unit
C_{IN1}	Input Capacitance: A0-A8	5	pF
C_{IN2}	Input Capacitance: $\overline{RAS}$, $\overline{UCAS}$, $\overline{LCAS}$, $\overline{WE}$, $\overline{OE}$	7	pF
C_{IO}	Data Input/Output Capacitance: I/O0-I/O15	7	pF

Notes:
1. Tested initially and after any design or process changes that may affect these parameters.
2. Test conditions: T_A = 25°C, f = 1 MHz.

ELECTRICAL CHARACTERISTICS[1]

(Recommended Operating Conditions unless otherwise noted.)

Symbol	Parameter	Test Condition		Speed	Min.	Max.	Unit
I_{IL}	Input Leakage Current	Any input 0V < V_{IN} < Vcc Other inputs not under test = 0V			–10	10	µA
I_{IO}	Output Leakage Current	Output is disabled (Hi-Z) 0V < V_{OUT} < Vcc			–10	10	µA
V_{OH}	Output High Voltage Level	I_{OH} = –5 mA			2.4	—	V
V_{OL}	Output Low Voltage Level	I_{OL} = +4.2 mA			—	0.4	V
I_{CC1}	Standby Current: TTL	$\overline{RAS}$, $\overline{LCAS}$, $\overline{UCAS}$ > V_{IH}	Commerical	5V	—	2	mA
			Commerical	3.3V	—	1	
I_{CC2}	Standby Current: CMOS	$\overline{RAS}$, $\overline{LCAS}$, $\overline{UCAS}$ > V_{CC} – 0.2V		5V	—	1	mA
				3.3V	—	0.5	
I_{CC3}	Operating Current: Random Read/Write[2,3,4] Average Power Supply Current	$\overline{RAS}$, $\overline{LCAS}$, $\overline{UCAS}$, Address Cycling, t_{RC} = t_{RC} (min.)		-25 30 35 40	— — — —	170 150 130 120	mA
I_{CC4}	Operating Current: EDO Page Mode[2,3,4] Average Power Supply Current	$\overline{RAS}$ = V_{IL}, $\overline{LCAS}$, $\overline{UCAS}$, Cycling t_{PC} = t_{PC} (min.)		-25 30 35 40	— — — —	170 150 130 120	mA
I_{CC5}	Refresh Current: $\overline{RAS}$-Only[2,3] Average Power Supply Current	$\overline{RAS}$ Cycling, $\overline{LCAS}$, $\overline{UCAS}$ > V_{IH} t_{RC} = t_{RC} (min.)		-25 30 35 40	— — — —	170 150 130 120	mA
I_{CC6}	Refresh Current: CBR[2,3,5] Average Power Supply Current	$\overline{RAS}$, $\overline{LCAS}$, $\overline{UCAS}$ Cycling t_{RC} = t_{RC} (min.)		-25 30 35 40	— — — —	170 150 130 120	mA

Notes:

1. An initial pause of 200 µs is required after power-up followed by eight $\overline{RAS}$ refresh cycles ($\overline{RAS}$-Only or CBR) before proper device operation is assured. The eight $\overline{RAS}$ cycles wake-up should be repeated any time the t_{REF} refresh requirement is exceeded.
2. Dependent on cycle rates.
3. Specified values are obtained with minimum cycle time and the output open.
4. Column-address is changed once each EDO page cycle.
5. Enables on-chip refresh and address counters.

AC TEST CONDITIONS

Output load: Two TTL Loads and 50 pF (Vcc = 5.0V ±10%)
One TTL Load and 50 pF (Vcc = 3.3V ±10%)

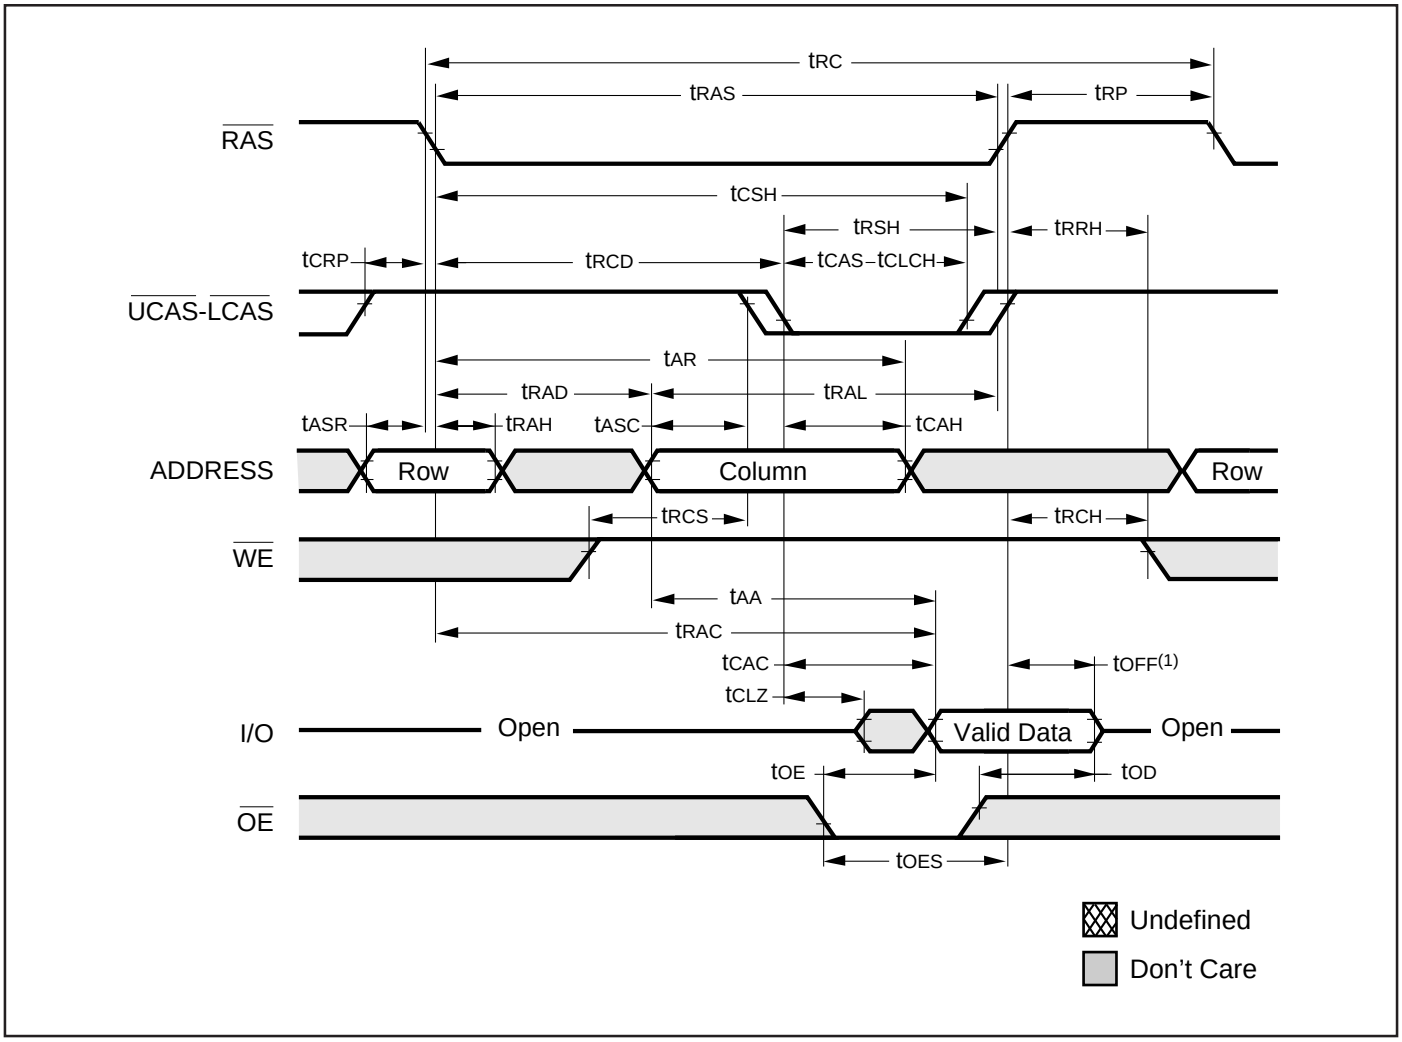
Input timing reference levels: V_{IH} = 2.4V, V_{IL} = 0.8V (Vcc = 5.0V ±10%);
V_{IH} = 2.0V, V_{IL} = 0.8V (Vcc = 3.3V ±10%)

Output timing reference levels: V_{OH} = 2.0V, V_{OL} = 0.8V (Vcc = 5V ±10%, 3.3V ±10%)

Notes:

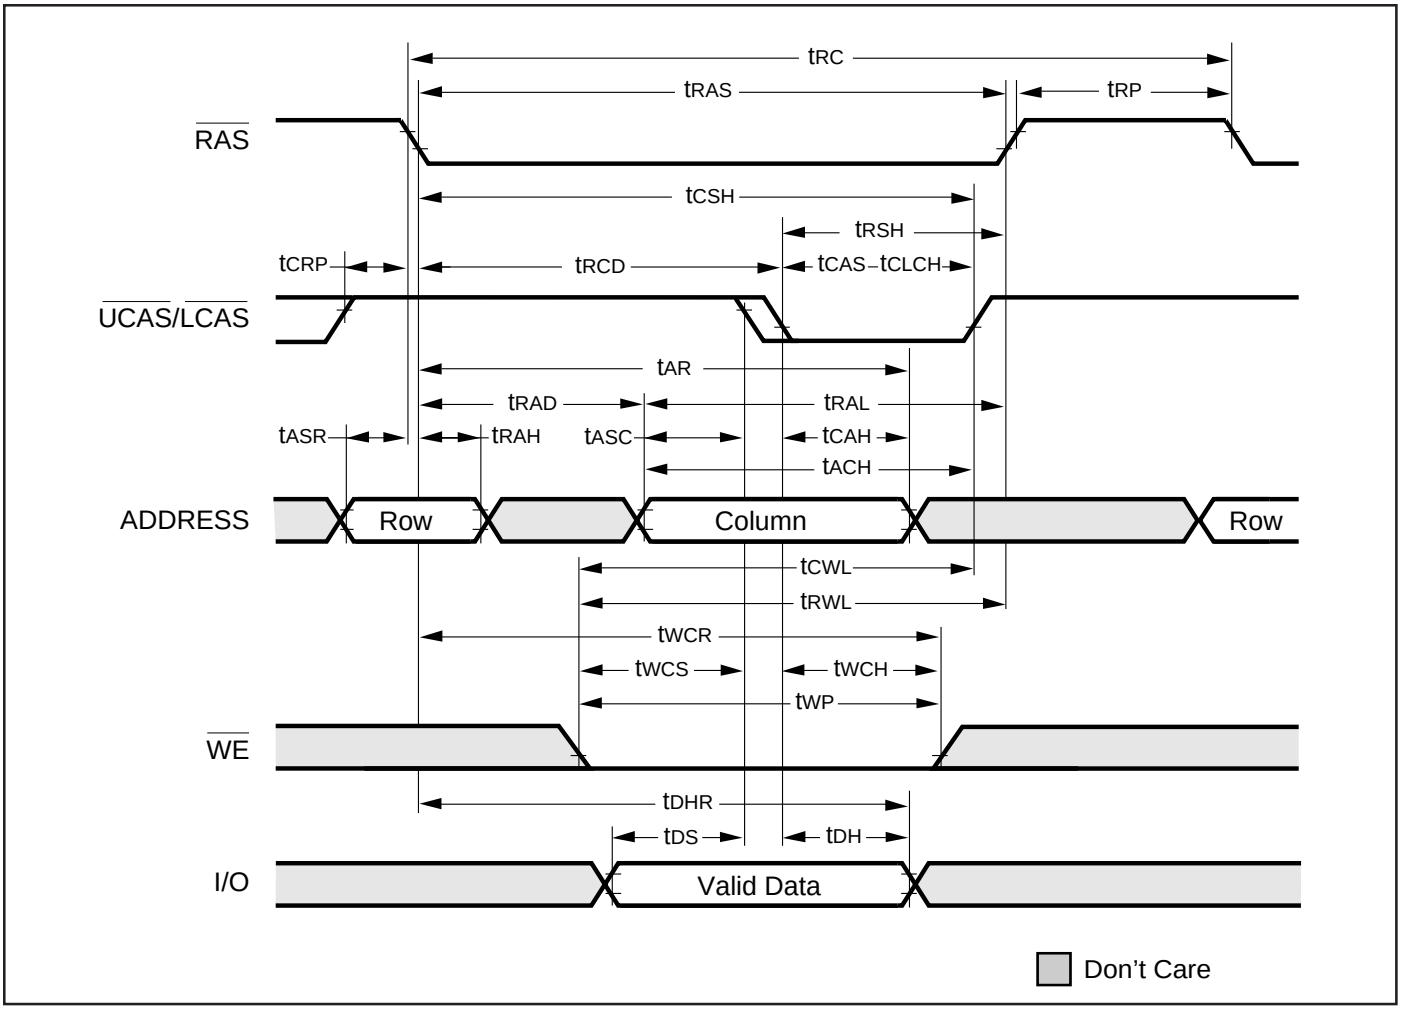
1. An initial pause of 200 µs is required after power-up followed by eight $\overline{RAS}$ refresh cycle ($\overline{RAS}$-Only or CBR) before proper device operation is assured. The eight $\overline{RAS}$ cycles wake-up should be repeated any time the t_{REF} refresh requirement is exceeded.
2. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times, are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) and assume to be 1 ns for all inputs.
3. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
4. If $\overline{CAS}$ and $\overline{RAS}$ = V_{IH}, data output is High-Z.
5. If $\overline{CAS}$ = V_{IL}, data output may contain data from the last valid READ cycle.
6. Measured with a load equivalent to one TTL gate and 50 pF.
7. Assumes that $t_{RCD} \leq t_{RCD}$ (MAX). If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will increase by the amount that t_{RCD} exceeds the value shown.
8. Assumes that $t_{RCD} \geq t_{RCD}$ (MAX).
9. If $\overline{CAS}$ is LOW at the falling edge of $\overline{RAS}$, data out will be maintained from the previous cycle. To initiate a new cycle and clear the data output buffer, $\overline{CAS}$ and $\overline{RAS}$ must be pulsed for t_{CP}.
10. Operation with the t_{RCD} (MAX) limit ensures that t_{RAC} (MAX) can be met. t_{RCD} (MAX) is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD} (MAX) limit, access time is controlled exclusively by t_{CAC}.
11. Operation within the t_{RAD} (MAX) limit ensures that t_{RCD} (MAX) can be met. t_{RAD} (MAX) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD} (MAX) limit, access time is controlled exclusively by t_{AA}.
12. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.
13. t_{OFF} (MAX) defines the time at which the output achieves the open circuit condition; it is not a reference to V_{OH} or V_{OL}.
14. t_{WCS}, t_{RWD}, t_{AWD} and t_{CWD} are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycle only. If $t_{WCS} \geq t_{WCS}$ (MIN), the cycle is an EARLY WRITE cycle and the data output will remain open circuit throughout the entire cycle. If $t_{RWD} \geq t_{RWD}$ (MIN), $t_{AWD} \geq t_{AWD}$ (MIN) and $t_{CWD} \geq t_{CWD}$ (MIN), the cycle is a READ-WRITE cycle and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until $\overline{CAS}$ and $\overline{RAS}$ or $\overline{OE}$ go back to V_{IH}) is indeterminate. $\overline{OE}$ held HIGH and $\overline{WE}$ taken LOW after $\overline{CAS}$ goes LOW result in a LATE WRITE ($\overline{OE}$-controlled) cycle.
15. Output parameter (I/O) is referenced to corresponding $\overline{CAS}$ input, I/O0-I/O7 by $\overline{LCAS}$ and I/O8-I/O15 by $\overline{UCAS}$.
16. During a READ cycle, if $\overline{OE}$ is LOW then taken HIGH before $\overline{CAS}$ goes HIGH, I/O goes open. If $\overline{OE}$ is tied permanently LOW, a LATE WRITE or READ-MODIFY-WRITE is not possible.
17. Write command is defined as $\overline{WE}$ going low.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both t_{OD} and t_{OEH} met ($\overline{OE}$ HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The I/Os will provide the previously written data if $\overline{CAS}$ remains LOW and $\overline{OE}$ is taken back to LOW after t_{OEH} is met.
19. The I/Os are in open during READ cycles once t_{OD} or t_{OFF} occur.
20. The first $\chi\overline{CAS}$ edge to transition LOW.
21. The last $\chi\overline{CAS}$ edge to transition HIGH.
22. These parameters are referenced to $\overline{CAS}$ leading edge in EARLY WRITE cycles and $\overline{WE}$ leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
23. Last falling $\chi\overline{CAS}$ edge to first rising $\chi\overline{CAS}$ edge.
24. Last rising $\chi\overline{CAS}$ edge to next cycle's last rising $\chi\overline{CAS}$ edge.
25. Last rising $\chi\overline{CAS}$ edge to first falling $\chi\overline{CAS}$ edge.
26. Each $\chi\overline{CAS}$ must meet minimum pulse width.
27. Last $\chi\overline{CAS}$ to go LOW.
28. I/Os controlled, regardless $\overline{UCAS}$ and $\overline{LCAS}$.
29. The 3 ns minimum is a parameter guaranteed by design.
30. Enables on-chip refresh and address counters.

READ CYCLE

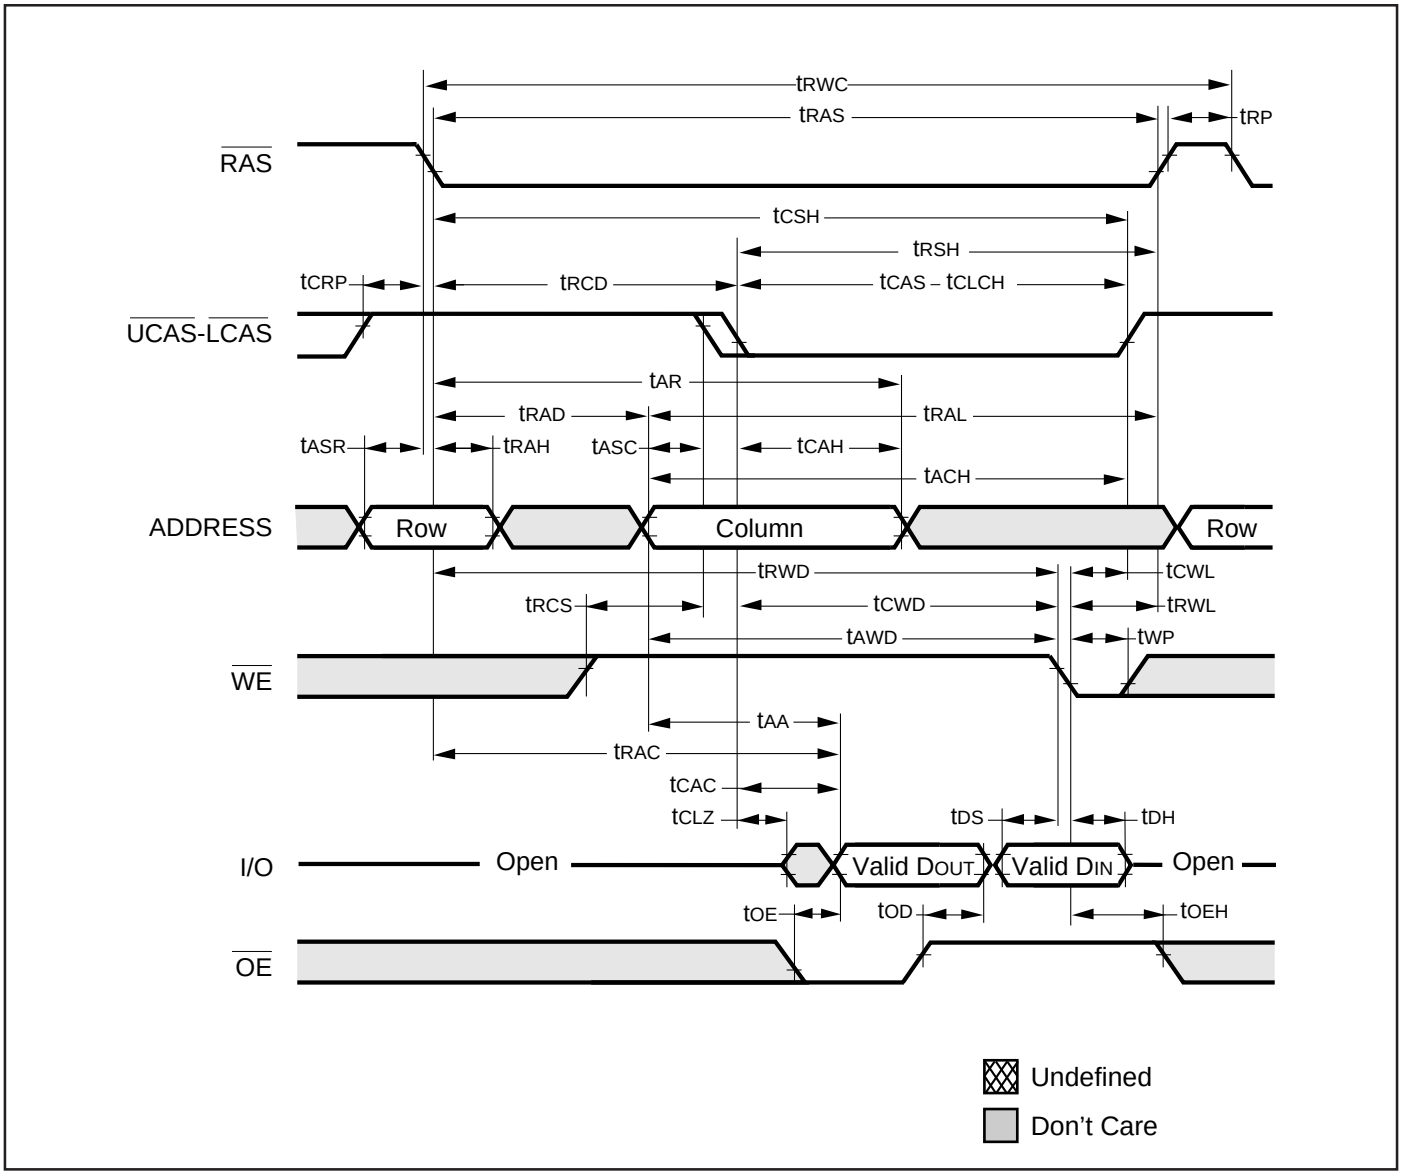


Note:
1. tOFF is referenced from rising edge of $\overline{RAS}$ or $\overline{CAS}$, whichever occurs last.

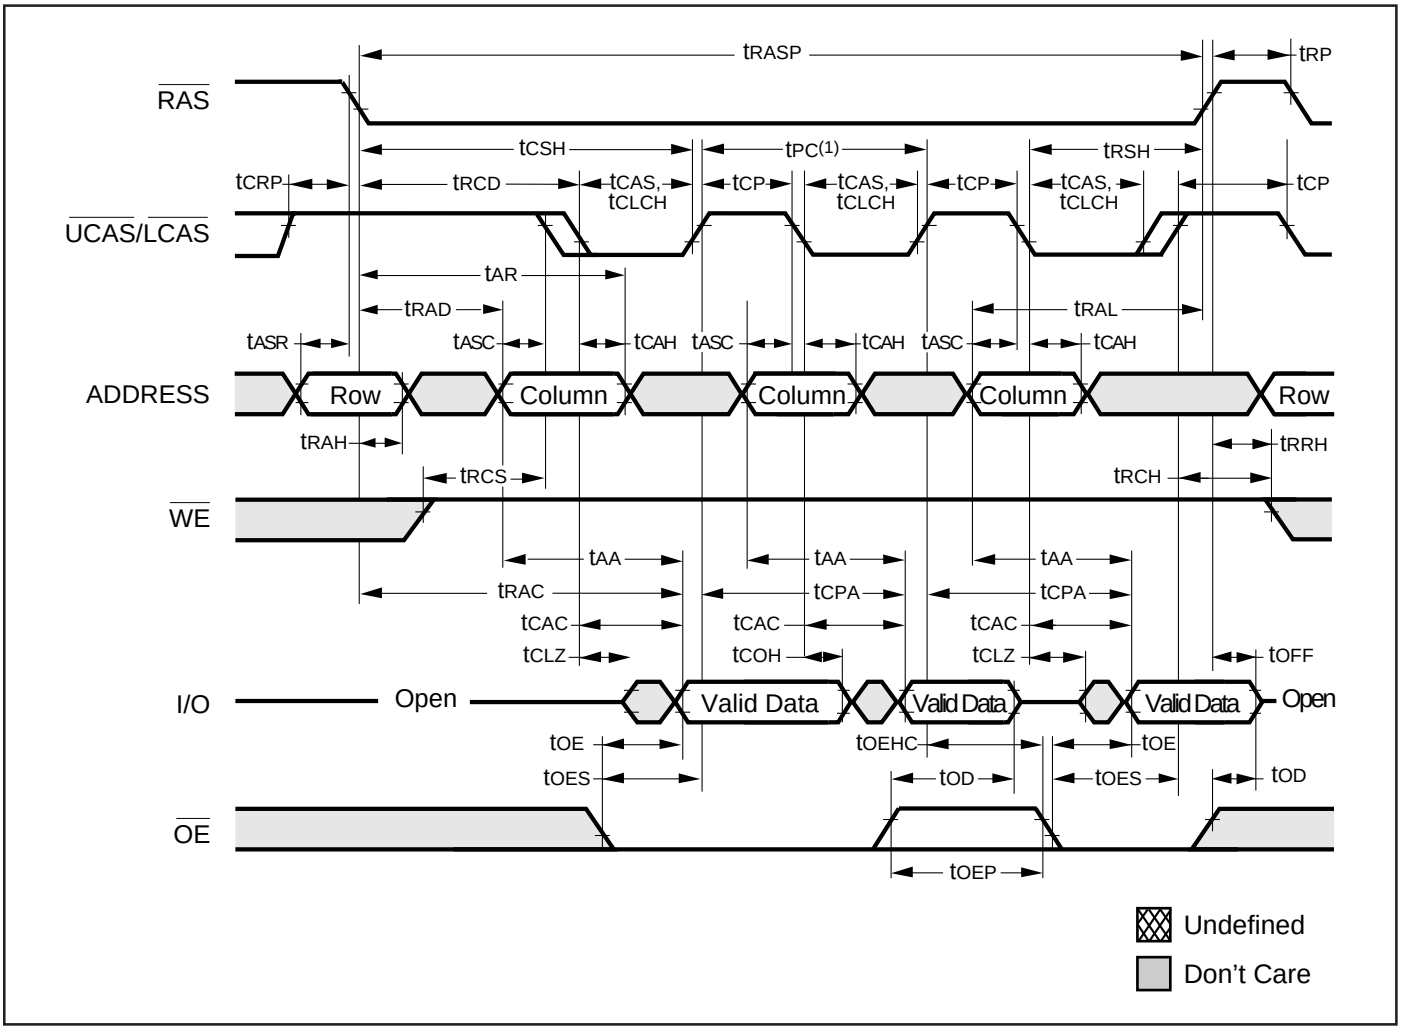
EARLY WRITE CYCLE ($\overline{OE}$ = DON'T CARE)



READ WRITE CYCLE (LATE WRITE and READ-MODIFY-WRITE Cycles)



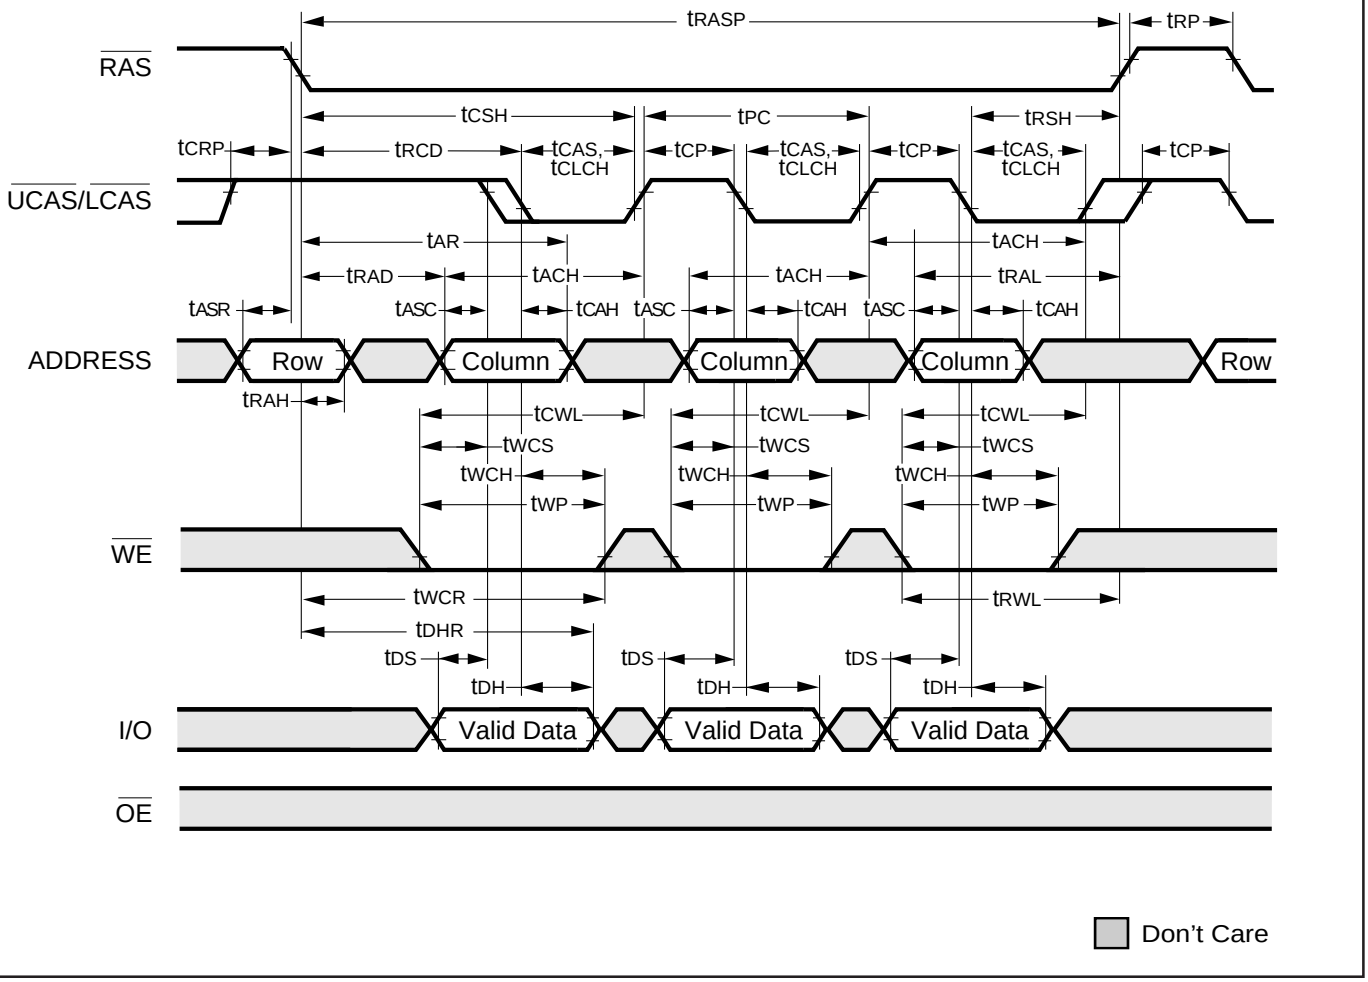
EDO-PAGE-MODE READ CYCLE



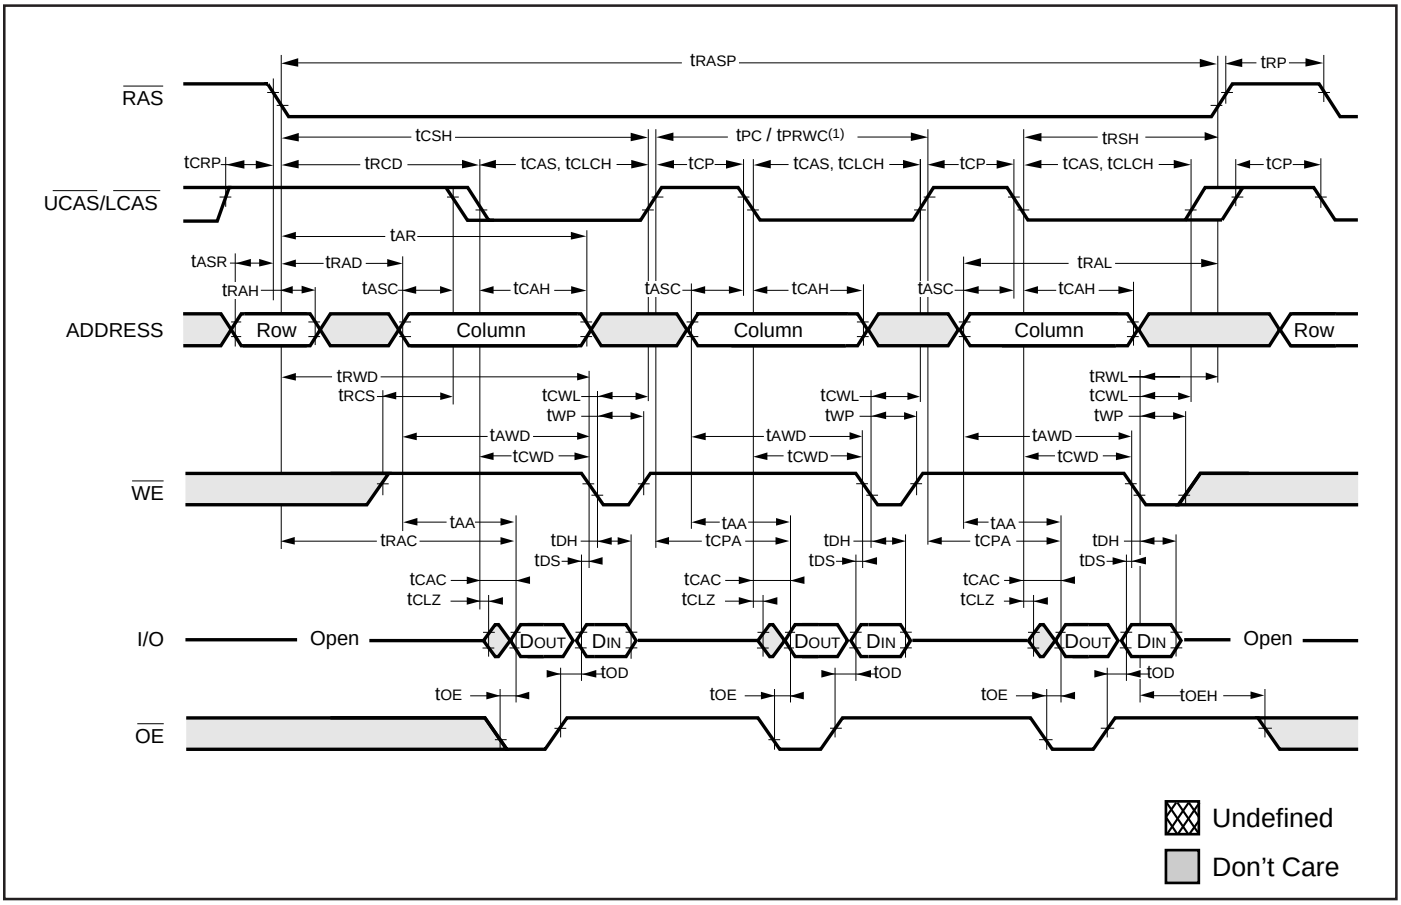
Note:

1. t_{PC} can be measured from falling edge of $\overline{CAS}$ to falling edge of $\overline{CAS}$, or from rising edge of $\overline{CAS}$ to rising edge of $\overline{CAS}$. Both measurements must meet the t_{PC} specifications.

EDO-PAGE-MODE EARLY-WRITE CYCLE



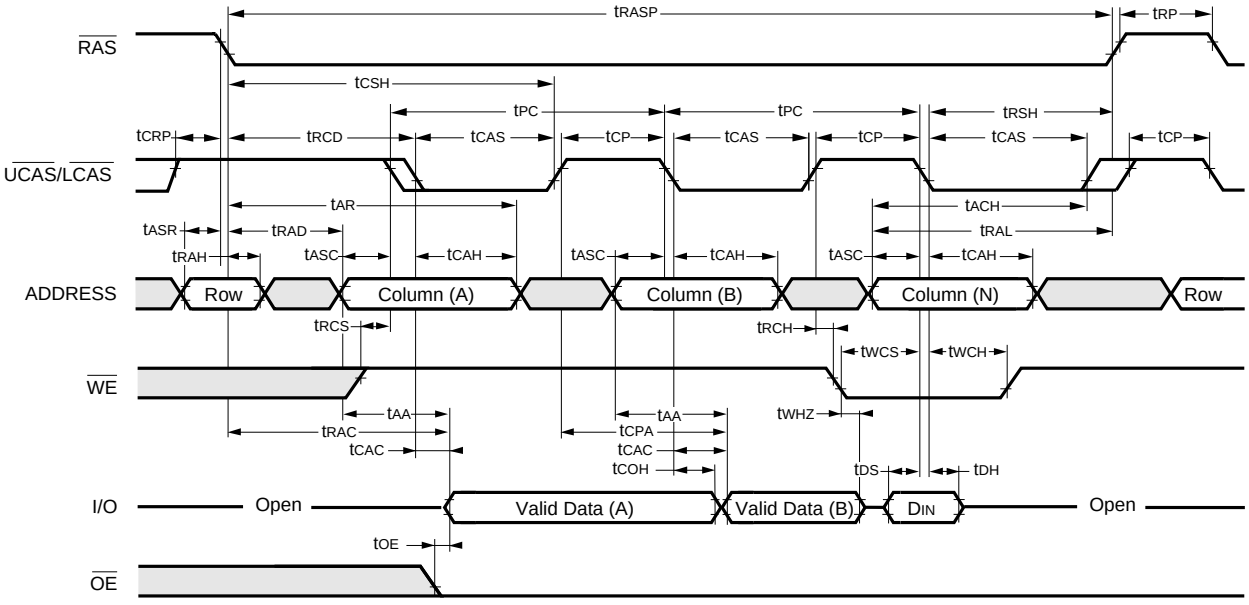
EDO-PAGE-MODE READ-WRITE CYCLE (LATE WRITE and READ-MODIFY WRITE Cycles)



Note:

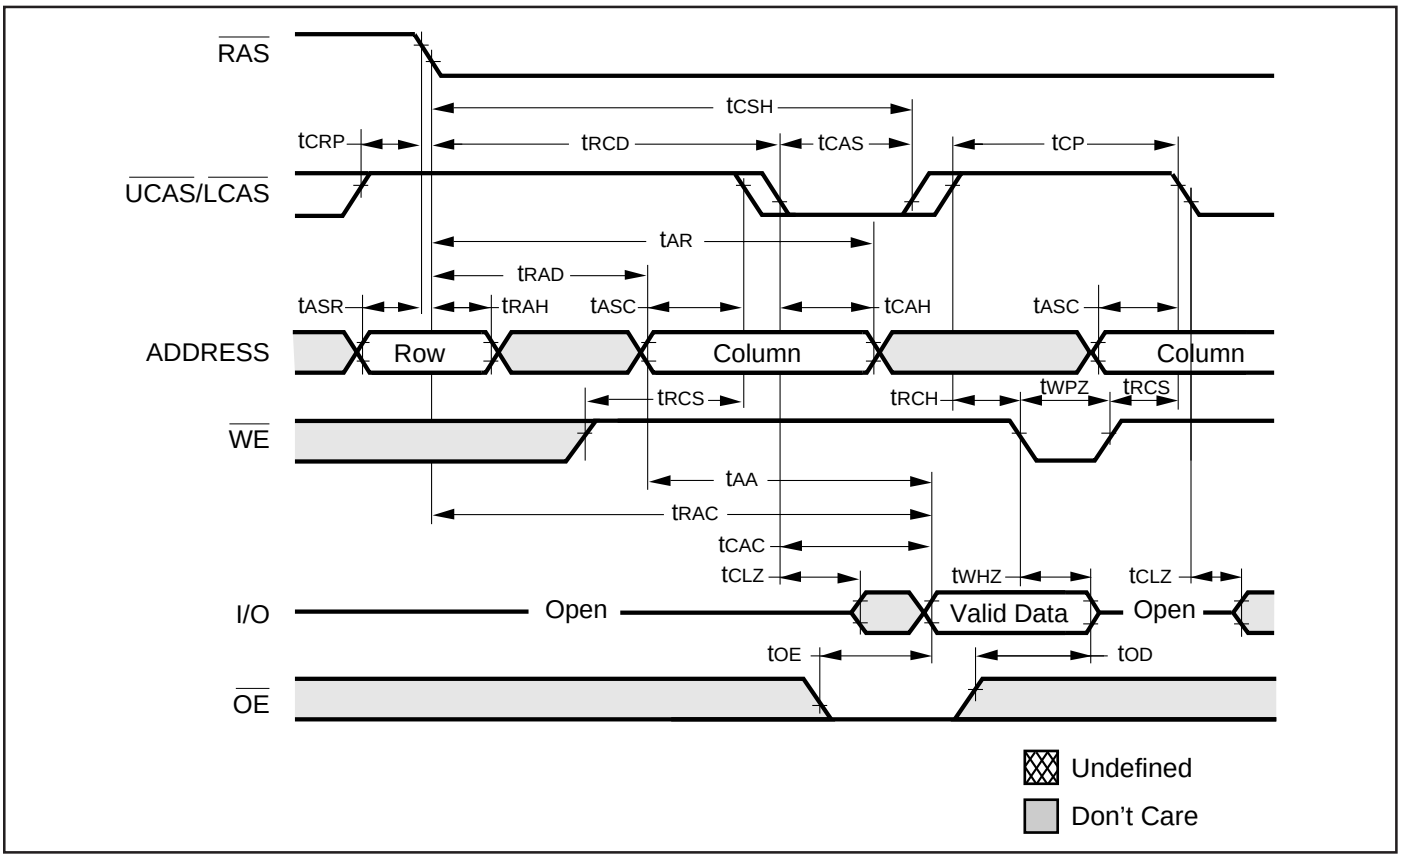
1. tPC is for LATE write cycles only. tPC can be measured from falling edge of CAS to falling edge of CAS, or from rising edge of CAS to rising edge of CAS. Both measurements must meet the tPC specifications.

EDO-PAGE-MODE READ-EARLY-WRITE CYCLE (Psuedo READ-MODIFY WRITE)

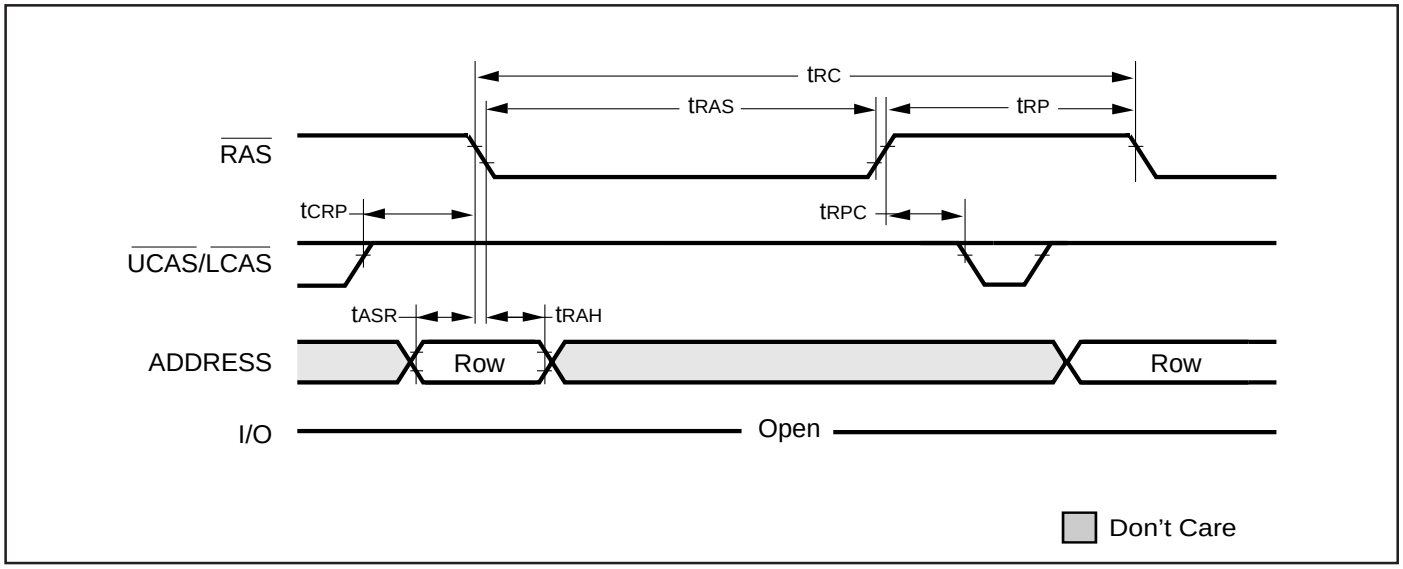


AC WAVEFORMS

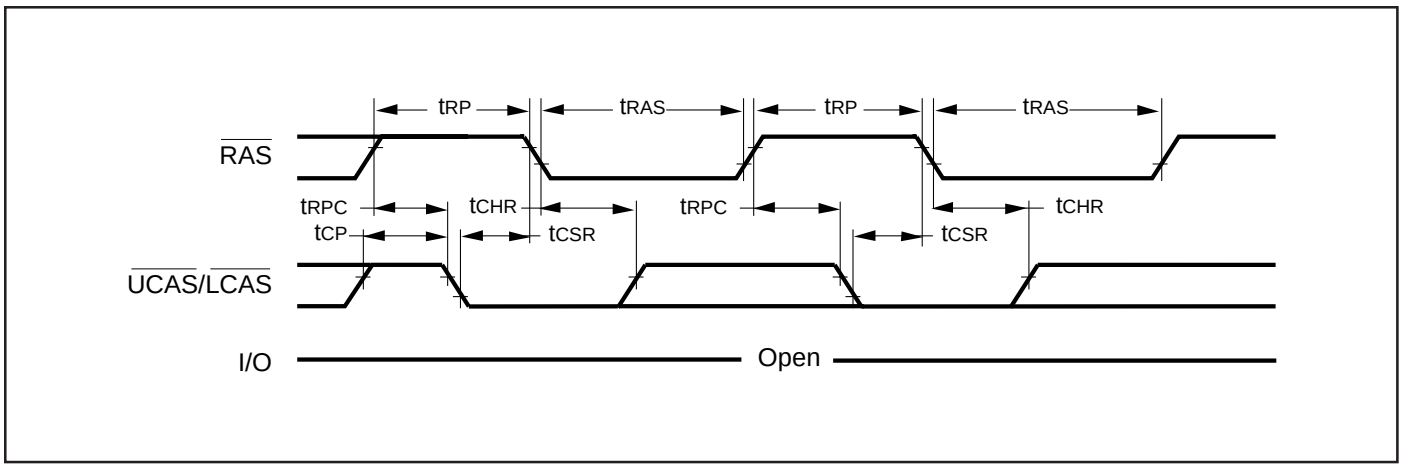
READ CYCLE (With $\overline{WE}$-Controlled Disable)



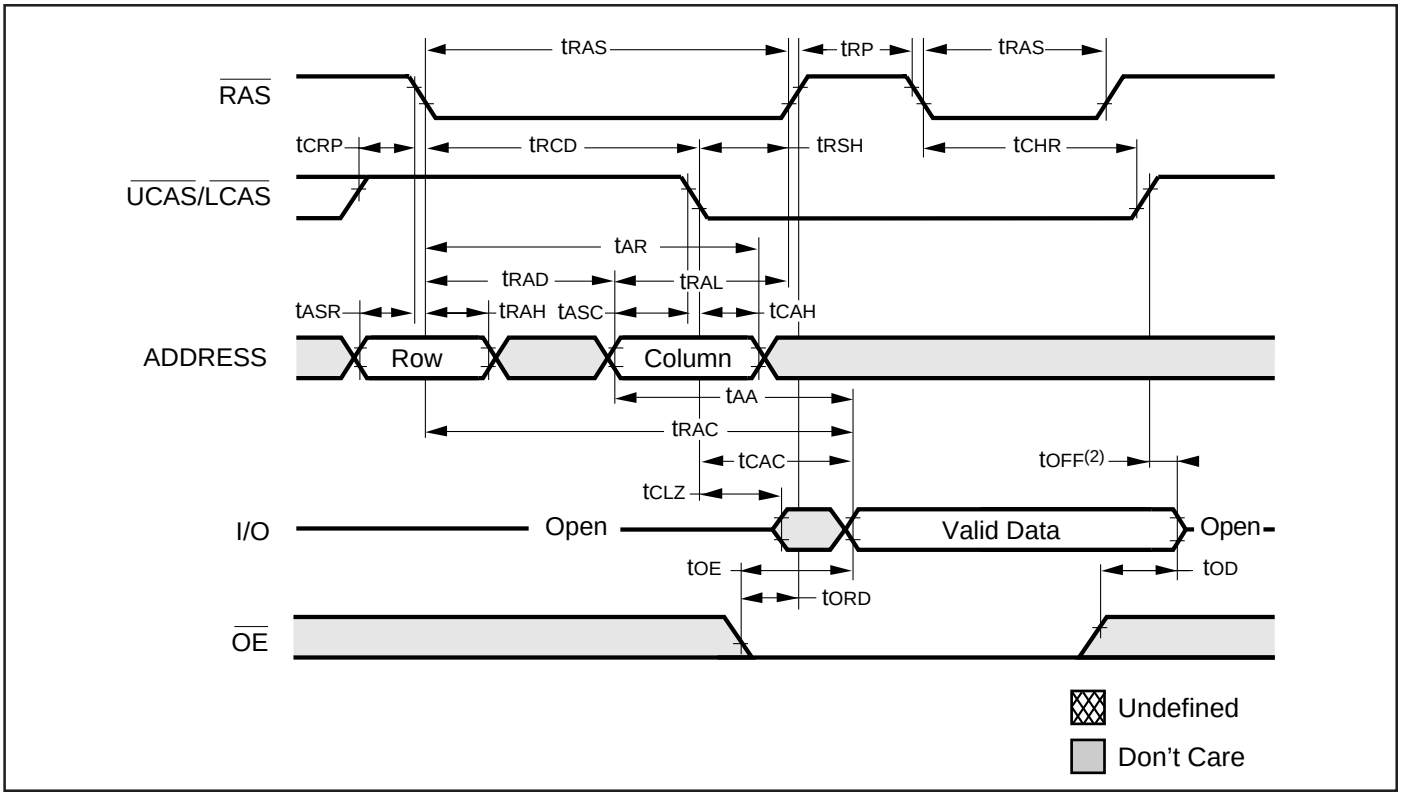
$\overline{RAS}$-ONLY REFRESH CYCLE ($\overline{OE}$, $\overline{WE}$ = DON'T CARE)



CBR REFRESH CYCLE (Addresses; $\overline{WE}$, $\overline{OE}$ = DON'T CARE)



HIDDEN REFRESH CYCLE(1) ($\overline{WE}$ = HIGH; $\overline{OE}$ = LOW)



Notes:
1. A Hidden Refresh may also be performed after a Write Cycle. In this case, $\overline{WE}$ = LOW and $\overline{OE}$ = HIGH.
2. tOFF is referenced from rising edge of $\overline{RAS}$ or $\overline{CAS}$, whichever occurs last.

ORDERING INFORMATION
IC41C1664
Commercial Range: 0°C to 70°C

Speed (ns)	Order Part No.	Package
25	IC41C1664-25K	400mil SOJ
	IC41C1664-25T	400mil TSOP-2
30	IC41C1664-30K	400mil SOJ
