PAL decoder**TDA4510****GENERAL DESCRIPTION**

The TDA4510 is a colour decoder for the PAL standard, which is pin sequent compatible with multistandard decoder TDA4555 and also pin compatible with NTSC decoder TDA4570. It incorporates the following functions:

Chrominance part

- Gain controlled chrominance amplifier with operating point control stage
- Chrominance output stage for driving the 64 μ s delay line
- Blanking circuit for the colour burst signal
- Automatic chrominance control (ACC) with sampled rectifier during burst-key

Oscillator and control voltage part

- Reference oscillator for double subcarrier frequency
- Gated phase comparison
- Identification demodulator and automatic colour killer
- Sandcastle pulse detector
- Service switch

Demodulator part

- Two synchronous demodulators for the (B-Y) and (R-Y) signals
- PAL flip-flop and PAL switch
- Colour switching stages
- Separate colour switching output
- (B-Y) and (R-Y) signal output stages
- Internal filtering of residual carrier

FUNCTIONAL DESCRIPTION**DIVIDER STAGES**

The divider stages provide $-(R-Y)$ and $-(B-Y)$ reference signals with the correct 90 degrees relation for the demodulators.

PHASE COMPARATOR

The phase comparator compares the $-(R-Y)$ reference signal with the burst pulse and controls the frequency and phase of the reference oscillator.

IDENTIFICATION DEMODULATOR

The identification demodulator delivers a positive going identification signal for PAL-signals at pin 14, also used for the automatic colour-killer.

SERVICE SWITCH

The service switch has two functions. The first position ($V_{14-3} < 1$ V) allows the adjustment of the reference oscillator. Therefore the colour is switched on and the burst for the oscillator PLL is switched off. The second position ($V_{14-3} > 5$ V) switches the colour on and the output signals can be observed.

SANDCASTLE PULSE DETECTOR

Sandcastle pulse detector for burst-gate, line and blanking (horizontal and vertical) pulse detection. The vertical part of the sandcastle pulse is needed for the internal colour-on and colour-off delay.

PULSE PROCESSING PART

Pulse processing part which shall prevent a premature switching on of the colour. The colour-on delay, two or three field periods after identification of the PAL signal, is achieved by a counter. The colour is switched off immediately or at the latest one field period after disappearance of the identification voltage.

RATINGS

SOLDERING**Introduction**

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "IC Package Databook" (order code 9398 652 90011).

Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact

with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
