### IC card interface TDA8002C

#### **FEATURES**

- Single supply voltage interface (3.3 or 5 V environment)
- Low-power sleep mode
- Three specific protected half-duplex bidirectional buffered I/O lines
- $V_{CC}$  regulation 5 V ±5% or 3 V ±5%,  $I_{CC}$  < 55 mA for  $V_{DD}$  = 3.0 to 6.5 V, with controlled rise and fall times
- Thermal and short-circuit protections with current limitations
- Automatic ISO 7816 activation and deactivation sequences
- Enhanced ESD protections on card side (>6 kV)
- Clock generation for the card up to 12 MHz with synchronous frequency changes
- Clock generation up to 20 MHz (external clock)
- Synchronous and asynchronous cards (memory and smart cards)
- ISO 7816, GSM11.11 compatibility and EMV (Europay, MasterCard® and Visa) compliant
- Step-up converter for V<sub>CC</sub> generation
- Supply supervisor for spikes elimination and emergency deactivation
- Chip select input for easy use of several TDA8002Cs in parallel.

#### **APPLICATIONS**

IC card readers for:

- · GSM applications
- Banking
- · Electronic payment
- Identification
- Pay TV
- · Road tolling.

#### **GENERAL DESCRIPTION**

The TDA8002C is a complete low-power analog interface for asynchronous and synchronous cards. It can be placed between the card and the microcontroller. It performs all supply, protection and control functions. It is directly compatible with ISO 7816, GSM11.11 and EMV specifications.

#### **ORDERING INFORMATION**

TYPE NUMBER		PACKAGE										
I THE NOWIDER	MARKING	NAME	DESCRIPTION	VERSION								
TDA8002CT/A/C1	TDA8002CT/A	SO28	plastic small outline package; 28 leads; body width	SOT136-1								
TDA8002CT/B/C1	TDA8002CT/B		7.5 mm									
TDA8002CT/C/C1	TDA8002CT/C											
TDA8002CG/C1	TDA8002C	LQFP32	plastic low profile quad flat package; 32 leads; body $5 \times 5 \times 1.4$ mm	SOT401-1

#### Note

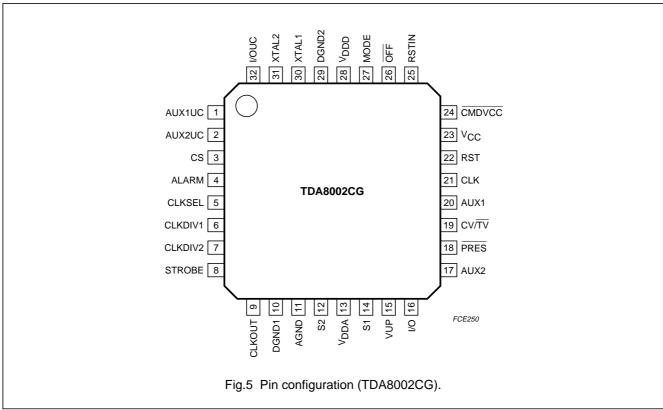

1. A pull-up resistor of 100  $k\Omega$  connected to  $V_{DD}$  is integrated.

IC card interface TDA8002C

7

IC card interface TDA8002C

#### **FUNCTIONAL DESCRIPTION**

#### Power supply

The supply pins for the chip are  $V_{DDA}$ ,  $V_{DDD}$ , AGND, DGND1 and DGND2.  $V_{DDA}$  and  $V_{DDD}$  (i.e.  $V_{DD}$ ) should be in the range of 3.0 to 6.5 V. All card contacts remain inactive during power-up or power-down.

On power-up, the logic is reset by an internal signal. The sequencer is not activated until  $V_{DD}$  reaches  $V_{th2} + V_{hys2}$  (see Fig.6). When  $V_{DD}$  falls below  $V_{th2}$ , an automatic deactivation sequence of the contacts is performed.

#### Chip selection

The chip select pin (CS) allows the use of several TDA8002Cs in parallel.

When CS is HIGH, the pins RSTN,  $\overline{\text{CMDVCC}}$ , MODE, CV/ $\overline{\text{TV}}$ , CLKDIV1, CLKDIV2, CLKSEL and STROBE control the chip, pins I/OUC, AUX1UC and AUX2UC are the copy of I/O, AUX1 and AUX2 when enabled (with integrated 20 k $\Omega$  pull-up resistors connected to V<sub>DD</sub>) and  $\overline{\text{OFF}}$  is enabled.

When CS goes LOW, the levels on pins RSTIN,  $\overline{\text{CMDVCC}}$ , MODE, CV/TV, CLKDIV1, CLKDIV2 and STROBE are internally latched, I/OUC, AUX1UC and AUX2UC go to high-impedance with respect to I/O, AUX1 and AUX2 (with integrated 100 k $\Omega$  pull-up resistors connected to VDD) and  $\overline{\text{OFF}}$  is high-impedance.

#### Supply voltage supervisor (V<sub>DD</sub>)

This block surveys the  $V_{DD}$  supply. A defined retriggerable pulse of 10 ms minimum ( $t_W$ ) is delivered on the ALARM output during power-up or power-down of  $V_{DD}$  (see Fig.6). This signal is also used for eliminating the spikes on card contacts during power-up or power-down.

When  $V_{DD}$  reaches  $V_{th2} + V_{hys2}$ , an internal delay ( $t_W$ ) is started. The ALARM output is active until this delay has expired. When  $V_{DD}$  falls below  $V_{th2}$ , ALARM is activated and a deactivation sequence of the contacts is performed.

#### **Clock circuitry**

The TDA8002C supports both synchronous and asynchronous cards. There are three methods to clock the circuitry:

- · Apply a clock signal to pin STROBE
- · Use of an internal RC oscillator
- Use of a quartz oscillator which should be connected between pins XTAL1 and XTAL2 or an external clock applied on XTAL1.

When CLKSEL is HIGH, the clock should be applied to the STROBE pin. When CLKSEL is LOW, the internal oscillators is used.

When an internal clock is used, the clock output is available on pin CLKOUT. The RC oscillator is selected by making CLKDIV1 HIGH and CLKDIV2 LOW. The clock output to the card is available on pin CLK. The frequency of the card clock can be the input frequency divided by 2 or 4, STOP low or 1.25 MHz, depending on the states of CLKDIV1 or CLKDIV2 (see Table 1).

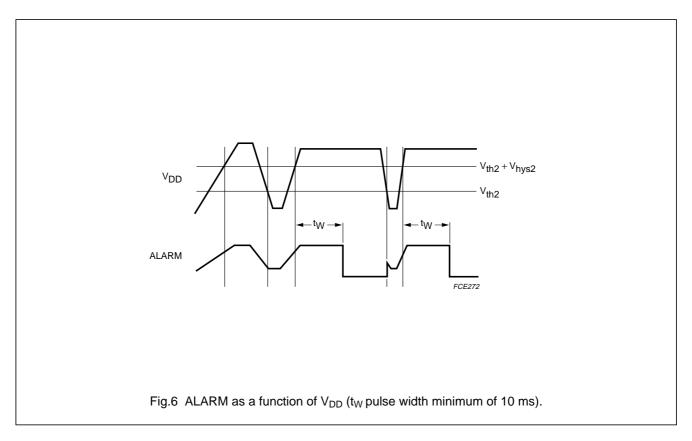

When STROBE is used for entering the clock to a synchronous card, STROBE should remain stable during activation sequence otherwise the first pulse may be omitted.

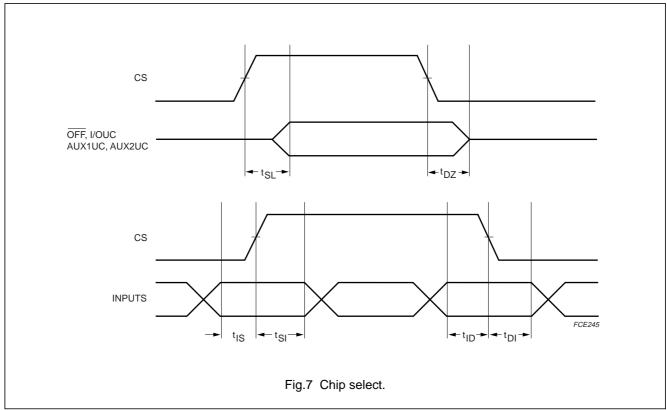

Do not change CLKSEL during activation. When in low-power (sleep) mode, the internal oscillator frequency which is available on pin CLKOUT is lowered to approximately 16 kHz for power economy purposes.

IC card interface TDA8002C

Table 1 Clock circuitry definition

MODE	CLKSEL	CLKDIV1	CLKDIV2	FREQUENCY OF CLK	FREQUENCY OF CLKOUT
HIGH	LOW	HIGH	LOW	½f <sub>int</sub>	½f <sub>int</sub>
HIGH	LOW	LOW	LOW	<sup>1</sup> / <sub>4</sub> f <sub>xtal</sub>	f <sub>xtal</sub>
HIGH	LOW	LOW	HIGH	<sup>1</sup> / <sub>2</sub> f <sub>xtal</sub>	f <sub>xtal</sub>
HIGH	LOW	HIGH	HIGH	STOP low	f <sub>xtal</sub>
HIGH	HIGH	X <sup>(1)</sup>	X <sup>(1)</sup>	STROBE	f <sub>xtal</sub>
LOW <sup>(2)</sup>	X <sup>(1)</sup>	X <sup>(1)</sup>	X <sup>(1)</sup>	STOP low	1/2f <sub>int</sub> (3)

#### **Notes**

- 1. X = don't care.
- 2. In low-power mode.
- 3.  $f_{int} = 32 \text{ kHz in low-power mode.}$

#### I/O circuitry

The three I/O transceivers are identical. The state is HIGH for all I/O pins (i.e. I/O, I/OUC, AUX1, AUX1UC, AUX2 and AUX2UC). Pin I/O is referenced to  $V_{CC}$  and pin I/OUC to  $V_{DD}$ , thus ensuring proper operation in the event that  $V_{CC} \neq V_{DD}$ .

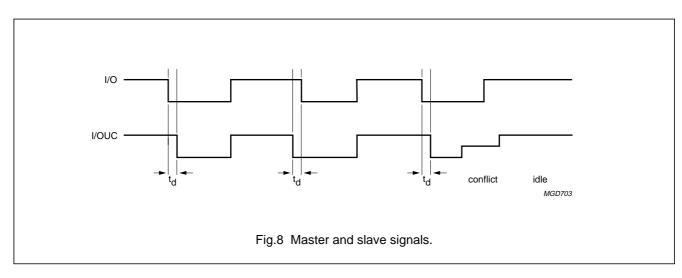

The first side on which a falling edge is detected becomes a master (input). An anti-latch circuitry first disables the detection of the falling edge on the other side, which becomes slave (output), see Fig.8.

After a delay time  $t_{\text{d}}$  (between 50 and 400 ns), the logic 0 present on the master side is transferred on the slave side.

When the input is back to HIGH level, a current booster is turned on during the delay  $t_{\rm d}$  on the output side and then both sides are back to their idle state, ready to detect the next logic 0 on any side.

In the event of a conflict, both lines may remain LOW until the software enables the lines to be HIGH. The anti-latch circuitry ensures that the lines do not remain LOW if both sides return HIGH, regardless of the prior conditions. The maximum frequency on the lines is approximately 200 kHz.

When CS is HIGH, I/OUC, AUX1UC and AUX2UC are internally pulled-up to  $V_{DD}$  with 20  $k\Omega$  resistors. When CS is LOW, I/OUC, AUX1UC and AUX2UC are permanently HIGH (with integrated 100  $k\Omega$  pull-up resistors connected to  $V_{DD}$ ).

IC card interface TDA8002C

#### Logic circuitry

After power-up, the circuit has six possible states of operation. Figure 9 shows the state diagram.

#### **I**DLE MODE

After reset, the circuit enters the idle mode. A minimum number of functions in the circuit are active while waiting for the microcontroller to start a session:

- · All card contacts are inactive
- I/OUC, AUX1UC and AUX2UC are high-impedance
- · Oscillator (XTAL) runs, delivering CLKOUT
- · Voltage supervisor is active.

#### LOW-POWER MODE

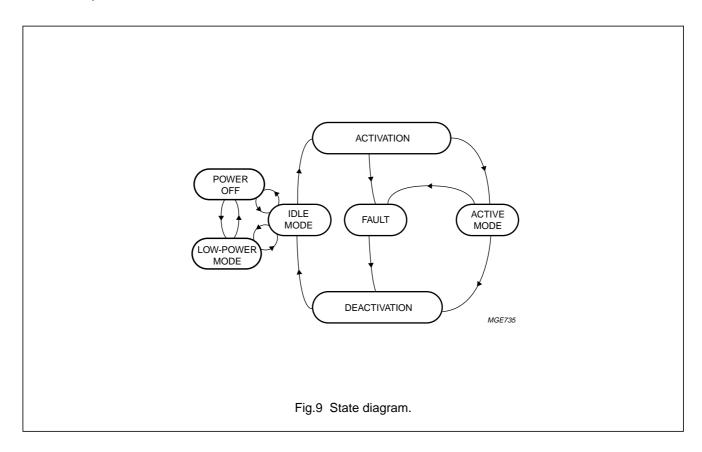

When pin MODE goes LOW, the circuit enters the low-power (sleep) mode. As long as pin MODE is LOW no activation is possible.

If pin MODE goes LOW in the active mode, a normal deactivation sequence is performed before entering the low-power mode. When pin MODE goes HIGH, the circuit enters the normal operating mode after a delay of at least 6 ms (96 cycles of CLKOUT). During this time the CLKOUT remains at 16 kHz.

- · All card contacts are inactive
- · Oscillator (XTAL) does not operate
- The V<sub>DD</sub> supervisor, ALARM output, card presence detection and OFF output remain functional
- Internal oscillator is slowed to 32 kHz, providing 16 kHz on CLKOUT.

#### **ACTIVE MODE**

When the activation sequence is completed, the TDA8002C will be in the active mode. Data is exchanged between the card and the microcontroller via the I/O lines.

IC card interface TDA8002C

#### **ACTIVATION SEQUENCE**

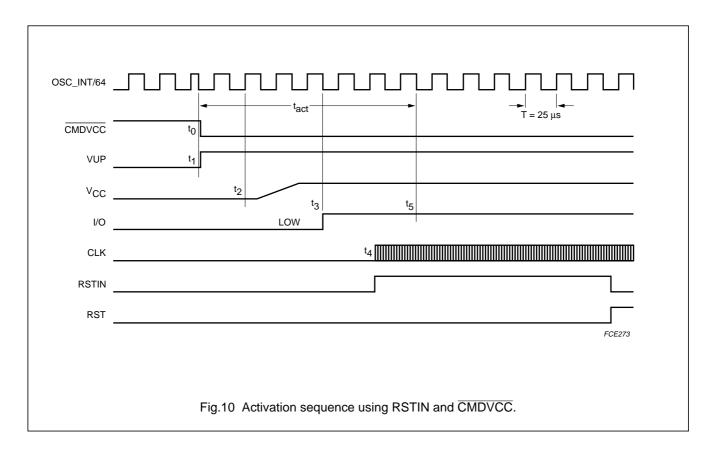

From Idle mode, the circuit enters the activation mode when the microcontroller sets the  $\overline{\text{CMDVCC}}$  line LOW or sets the MODE line HIGH when the  $\overline{\text{CMDVCC}}$  line is already LOW. The internal circuitry is then activated, the internal clock is activated and an activation sequence is executed. When RST is enabled it becomes the inverse of RSTIN.

Figures 10 to 12 illustrate the activation sequence as follows:

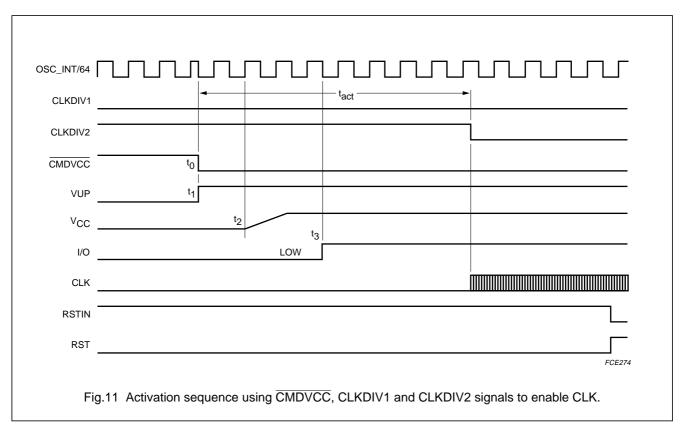

1. Step-up converter is started  $(t_1 \approx t_0)$ 

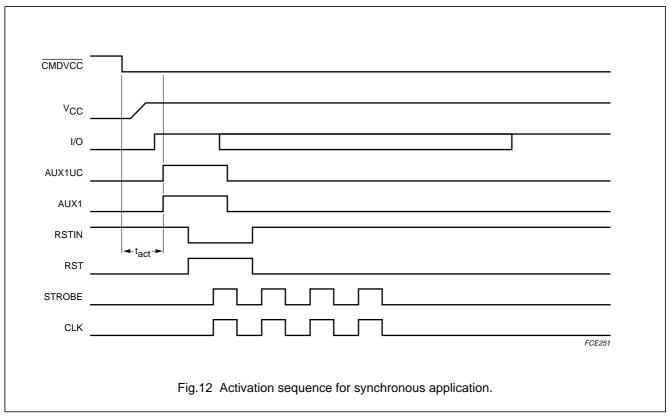

- 2.  $V_{CC}$  rises from 0 to 3 or 5 V ( $t_2 = t_1 + 1\frac{1}{2}T$ ) (according to the state on pin  $CV/\overline{TV}$ )
- 3. I/O, AUX1 and AUX2 are enabled and CLK is enabled  $(t_3 = t_1 + 4T)$ ; I/O, AUX1 and AUX2 were forced LOW until this time
- 4. CLK is set by setting RSTIN to HIGH (t<sub>4</sub>)
- 5. RST is enabled ( $t_5 = t_1 + 7T$ ); after  $t_5$ , RSTIN has no further action on CLK, but is only controlling RST.

The value of  $V_{CC}$  (5 or 3 V) must be selected by the level on pin  $CV/\overline{TV}$  before the activation sequence.

IC card interface TDA8002C

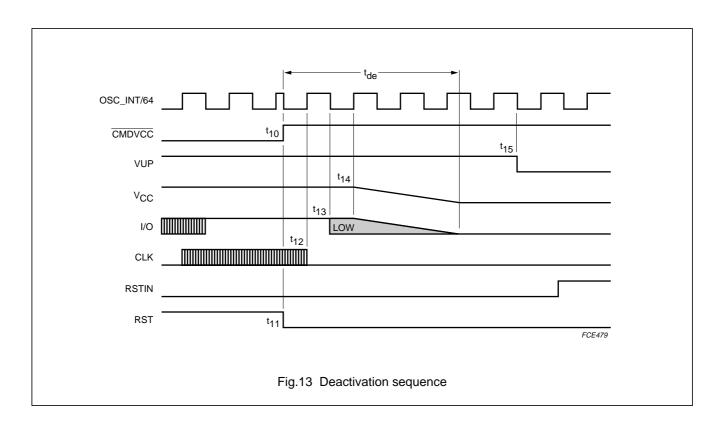

IC card interface TDA8002C

#### **DEACTIVATION SEQUENCE**

When a session is completed, the microcontroller sets the  $\overline{\text{CMDVCC}}$  line to HIGH state or MODE line to LOW state. The circuit then executes an automatic deactivation sequence by counting the sequencer down and thus end in the Idle mode.

Figures 13 and 14 illustrate the deactivation sequence as follows:

- 1. RST goes LOW  $(t_{11} \approx t_{10})$
- 2. CLK is stopped  $(t_{12} = t_{11} + \frac{1}{2}T)$
- 3. I/O, AUX1 and AUX2 fall to zero  $(t_{13} = t_{11} + T)$
- 4.  $V_{CC}$  falls to zero ( $t_{14} = t_{11} + 1\frac{1}{2}T$ ); a special circuit ensures that I/O remains below  $V_{CC}$  during the falling slope of  $V_{CC}$
- 5. VUP falls  $(t_{15} = t_{11} + 5T)$ .

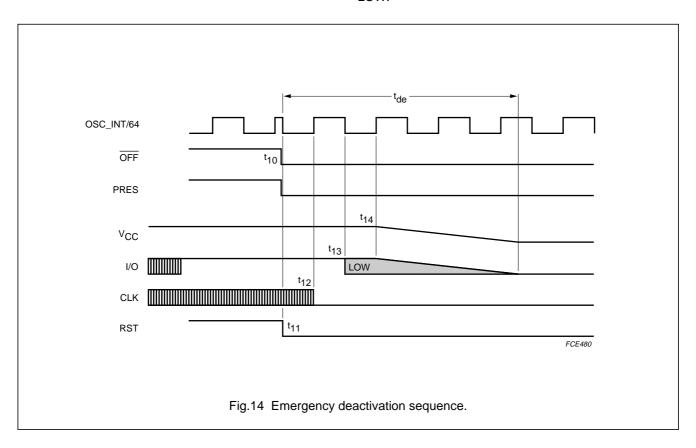

IC card interface TDA8002C

#### **Fault detection**

The following fault conditions are monitored by the circuit:

- Short-circuit or high current on V<sub>CC</sub>
- Removing card during transaction
- V<sub>DD</sub> dropping
- · Overheating.

When one or more of these faults are detected, the circuit pulls the interrupt line  $\overline{\text{OFF}}$  to its active LOW state and a deactivation sequence is initiated. In the event that the card is present the interrupt line  $\overline{\text{OFF}}$  is set to HIGH state when the microcontroller has reset the  $\overline{\text{CMDVCC}}$  line HIGH (after completion of the deactivation sequence). In the event that the card is not present  $\overline{\text{OFF}}$  remains LOW.

IC card interface TDA8002C

#### **LIMITING VALUES**

In accordance with the Absolute Maximum Rating System (IEC 134); note 1.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
$V_{DDD}$	digital supply voltage		-0.3	+6.5	V
$V_{DDA}$	analog supply voltage		-0.3	+6.5	V
V <sub>CC</sub>	card supply voltage pins; XTAL1, XTAL2, ALARM, CS, MODE, RSTIN, CLKSEL, AUX2UC, AUX1UC, CLKDIV1, CLKDIV2, CLKOUT, STROBE, CMDVCC, CV/TV and OFF		-0.3	+6.5	V
V <sub>i(card)</sub>	input voltage on card contact pins; I/O, AUX2, PRES, PRES, AUX1, CLK, RST and V <sub>CC</sub>		-0.3	+6.5	V
V <sub>es</sub>	electrostatic handling voltage on pins I/O, AUX2, PRES, PRES, AUX1, CLK, RST and V <sub>CC</sub>		-6	+6	kV
	on all other pins		-2	+2	kV
T <sub>stg</sub>	storage temperature		-55	+125	°C
P <sub>tot</sub>	continuous total power dissipation

T <sub>amb</sub>	ambient temperature		-25	+85	°C
T <sub>j</sub>	junction temperature			150	°C

#### Note

#### **HANDLING**

Every pin withstands the ESD test according to MIL-STD-883C class 3 for card contacts, class 2 for the remaining. Method 3015 (HBM 1500  $\Omega$ , 100 pF) 3 positive pulses and 3 negative pulses on each pin with respect to ground.

#### THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	VALUE	UNIT
R <sub>th(j-a)</sub>	thermal resistance from junction to ambient	in free air		
	SOT136-1		70	K/W
	SOT401-1		91	K/W

<sup>1.</sup> Stress beyond these levels may cause permanent damage to the device. This is a stress rating only and functional operation of the device under this condition is not implied.

IC card interface TDA8002C

IC card interface TDA8002C

#### **Notes**

1. It may be necessary to connect capacitors from XTAL1 and XTAL2 to ground depending on the choice of crystal or resonator.

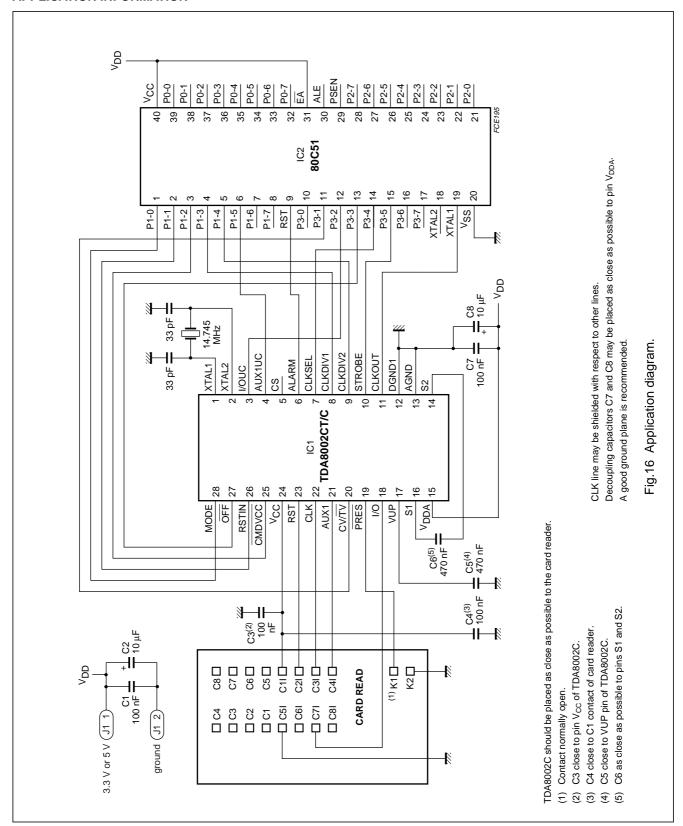

- 2. When the oscillator is stopped in mode 1, XTAL1 is set to HIGH.
- 2. When the oscillator is stopped in mode 1, ATAL 15 Set to 113.1.

  3. The transition time and duty cycle definitions are shown in Fig.15;  $\delta = \frac{t_1}{t_1 + t_2}$
- 4. CLKOUT transition time and duty cycle do not need to be tested.
- 5. PRES and CMDVCC are active LOW; RSTIN, PRES and CS are active HIGH.

#### **SOLDERING**

#### Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "Data Handbook IC26; Integrated Circuit Packages" (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering is not always suitable for surface mount ICs, or for printed-circuit boards with high population densities. In these situations reflow soldering is often used.

#### **Reflow soldering**

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 250 °C. The top-surface temperature of the packages should preferable be kept below 230 °C.

#### Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

 Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.

- For packages with leads on two sides and a pitch (e):
  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
  - smaller than 1.27 mm, the footprint longitudinal axis must be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

 For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time is 4 seconds at 250 °C. A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

#### Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320  $^{\circ}\text{C}.$ 

IC card interface TDA8002C

#### Suitability of surface mount IC packages for wave and reflow soldering methods

DACKACE	SOLDERING METHOD					
PACKAGE	WAVE	REFLOW <sup>(1)</sup>				
BGA, SQFP	not suitable	suitable				
HLQFP, HSQFP, HSOP, HTQFP, HTSSOP, SMS	not suitable <sup>(2)</sup>	suitable				
PLCC <sup>(3)</sup> , SO, SOJ	suitable	suitable				
LQFP, QFP, TQFP	not recommended <sup>(3)(4)</sup>	suitable				
SSOP, TSSOP, VSO	not recommended <sup>(5)</sup>	suitable				

#### **Notes**

- 1. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the "Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods".
- 2. These packages are not suitable for wave soldering as a solder joint between the printed-circuit board and heatsink (at bottom version) can not be achieved, and as solder may stick to the heatsink (on top version).
- 3. If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- 4. Wave soldering is only suitable for LQFP, TQFP and QFP packages with a pitch (e) equal to or larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- 5. Wave soldering is only suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.

#### **DEFINITIONS**

Data sheet status					
Objective specification	This data sheet contains target or goal specifications for product development.				
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.				
Product specification	ct specification This data sheet contains final product specifications.				
Limiting values					
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.					

#### **Application information**

Where application information is given, it is advisory and does not form part of the specification.

#### LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
