## DATA SHEET

# TDA8010M；TDA8010AM Low power mixers／oscillators for satellite tuners 

Objective specification
1996 Oct 24
Supersedes data of 1996 Oct 08
File under Integrated Circuits，IC02

Low power mixers/oscillators

## FEATURES

- Fully balanced mixer with common base input
- Wide input power and frequency range
- One-band 2 pin oscillator
- Local oscillator buffer and prescaler
- SAW filter IF preamplifier with gain control input and switchable output
- Bandgap voltage stabilizer for oscillator stability
- External IF filter between the mixer output and the IF amplifier input.

## GENERAL DESCRIPTION

The TDA8010M; TDA8010AM are integrated circuits that perform the mixer/oscillator function in satellite tuners.
The devices include a gain controlled IF amplifier that can directly drive two single-ended SAW filters or a differential SAW filter using a three function switchable output. They contain an internal LO prescaler and buffer that is compatible with the input of a terrestrial or satellite frequency synthesizer. They are also suitable for digital TV tuners. These devices are available in small outline packages that give the designer the capability to design an economical and physically small satellite tuner.

## APPLICATIONS

- Down frequency conversion in DBS (Direct

Broadcasting Satellite) satellite receivers.

## QUICK REFERENCE DATA

| SYMBOL | PARAMETER | CONDITIONS | MIN. | TYP. | MAX. | UNIT |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{CC}}$ | supply voltage |  | 4.5 | 5.0 | 5.5 | V |
| $\mathrm{I}_{\mathrm{CC}}$ | supply current |  | - | 70 | - | mA |
| $\mathrm{f}_{\mathrm{RF}}$ | RF frequency range |  | 700 | - | 2150 | MHz |
| $\mathrm{f}_{\text {Sc }}$ | oscillator frequency |  | 1380 | - | 2650 | MHz |
| $\mathrm{NF}_{\mathrm{M}}$ | mixer noise figure | corrected for image | - | 10 | - | dB |
| $\mathrm{G}_{\max }$ | maximum total gain | mixer plus IF | - | 40 | - | dB |
| $\mathrm{G}_{\min }$ | minimum total gain | mixer plus IF | - | -17 | - | dB |

## Low power mixers/oscillators for satellite tuners

## LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

| SYMBOL | PARAMETER | MIN. | MAX. | UNIT |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{V}_{\mathrm{CC}}$ | supply voltage | -0.3 | +6.0 | V |
| $\mathrm{~V}_{\mathrm{i}(\max )}$ | maximum input voltage on all pins | -0.3 | $\mathrm{~V}_{\mathrm{CC}}$ | V |
| $\mathrm{I}_{\text {source }(\max )}$ | maximum output source current | - | 10 | mA |
| $\mathrm{t}_{\text {sc }}$ | maximum short-circuit time on all outputs | - | 10 | s |
| $\mathrm{~T}_{\text {stg }}$ | storage temperature | -55 | +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{j}}$ | junction temperature | - | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {amb }}$ | operating ambient temperature | -20 | +80 | ${ }^{\circ} \mathrm{C}$ |

## THERMAL CHARACTERISTICS

| SYMBOL | PARAMETER | VALUE | UNIT |
| :--- | :--- | :---: | :---: |
| $R_{\text {th } j-a}$ | thermal resistance from junction to ambient in free air | 120 | K/W |

## HANDLING

All pins withstand the ESD test in accordance with "UZW-BO/FQ-A302 (human body model)" and with "UZW-BO/FQ-B302 (machine model)".

## Notes

1. Maximum gain: $\mathrm{V}_{\mathrm{AGC}}=0.9 \mathrm{~V}_{\mathrm{CC}} ; \mathrm{f}_{\mathrm{IF}}=480 \mathrm{MHz}$; IF output single-ended.
2. Minimum gain: $\mathrm{V}_{\mathrm{AGC}}=0.1 \mathrm{~V}_{\mathrm{CC}} ; \mathrm{f}_{\mathrm{IF}}=480 \mathrm{MHz}$; IF output single-ended.
3. RF input power range $=-70$ to -20 dBm .
4. $\mathrm{V}_{\mathrm{AGC}}=0.9 \mathrm{~V}_{\mathrm{CC}} ; \mathrm{f}_{\mathrm{IF}}=480 \mathrm{MHz} ; \mathrm{R}_{\text {source }}=100 \Omega$.
5. Switch isolation is defined at an IF output level of $77 \mathrm{~dB} \mu \mathrm{~V} ; \mathrm{f}_{\mathrm{IF}}=480 \mathrm{MHz}$.

## SOLDERING

## Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "IC Package Databook" (order code 9398652 90011).

## Reflow soldering

Reflow soldering techniques are suitable for all SSOP packages.
Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to $250^{\circ} \mathrm{C}$.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at $45^{\circ} \mathrm{C}$.

## Wave soldering

Wave soldering is not recommended for SSOP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

If wave soldering cannot be avoided, the following conditions must be observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow and must incorporate solder thieves at the downstream end.

Even with these conditions, only consider wave soldering SSOP packages that have a body width of 4.4 mm , that is SSOP16 (SOT369-1) or SSOP20 (SOT266-1).

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is $260^{\circ} \mathrm{C}$, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than $150^{\circ} \mathrm{C}$ within 6 seconds. Typical dwell time is 4 seconds at $250^{\circ} \mathrm{C}$.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

## Repairing soldered joints

Fix the component by first soldering two diagonallyopposite end leads. Use only a low voltage soldering iron (less than 24 V ) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to $300^{\circ} \mathrm{C}$. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and $320^{\circ} \mathrm{C}$.
