I²C BUS

24 TDA8405

TV AND VTR STEREO/DUAL SOUND PROCESSOR
WITH I²C BUS CONTROL

GENERAL DATA

The TDA8405 integrated circuit is a processor for stereo/dual-language signals for stereo-sound television receivers and VTR. The modulated signals at the TDA8405 inputs need to be "(L+R)/2" or "language A" on one channel and "R" or "language B" on the second channel (where L = left and R = right). The second channel is also modulated with the pilot carrier. The IC is controlled via the two-line, bidirectional I²C bus.

Features

- Amplification of the two a.f. input signals by integrated operational amplifiers.
- Low distortion stereo dematrix
- All operational amplifiers are offset compensated
- I²C bus transceiver for system control (port control, mute, mode select, identification, etc.)
- Input port for fast muting
- Two general purpose output ports (three-state, bus-controlled)

Notes to the characteristics

1. Full specification of the I^2C bus will be supplied on request.
2. Programmable mute state. If the SC3 bit in the I^2C bus is LOW then the mute input is active LOW; if the mute bit is set to HIGH then the mute input is active HIGH.
3. Crosstalk attenuation definition: 20 log (unwanted output signal/input signal).
4. Frequency range: 40 Hz $<$ f $<$ 12,5 kHz.
5. In dual sound mode.
6. Test circuit as in Fig. 4: ripple rejection = output modulation due to hum on the supply line.
7. Related to 2 V (r.m.s.) output signal at pin 19, 20, 21 or 22; noise weighted according to CCIR 468/2.
8. Caused by any change of the switch position.
9. α_S measured without de-emphasis network.
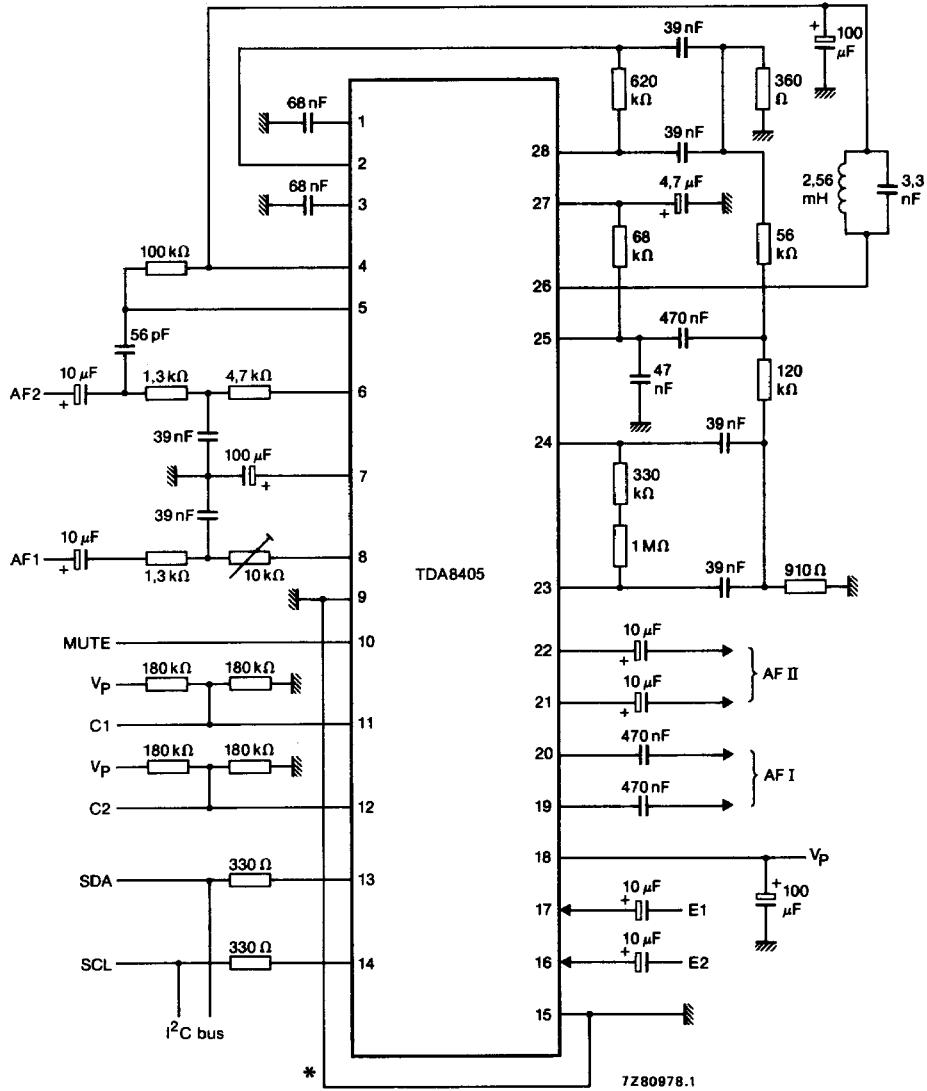

* Direct connection between pins 9 and 15 is needed.
