

WM8955BL

Stereo DAC For Portable Audio Applications

DESCRIPTION

The WM8955BL is a low power, high quality stereo DAC with integrated headphone and earpiece amplifiers, designed to reduce external component requirements in portable digital audio applications.

The on-chip headphone amplifiers can deliver 40mW into a 16Ω load. Advanced on-chip digital signal processing performs bass and treble tone control.

The WM8955BL can operate as a master or a slave, and includes an on-chip PLL. It can use most master clock frequencies commonly found in portable systems, including USB, GSM, CDMA or PDC clocks, or standard 256fs clock rates. Different audio sample rates such as 48kHz, 44.1kHz, 8kHz and many others are supported.

The WM8955BL operates on supply voltages from 1.8V up to 3.6V, although the digital core can operate on a separate supply down to 1.42V, saving power. Different sections of the chip can also be powered down under software control.

The WM8955BL is supplied in a very small and thin 4x4mm QFN package, ideal for use in hand-held and portable systems.

FEATURES

- DAC SNR 98dB, THD -86dB ('A' weighted @ 48kHz, 3.3V)
- On-chip Headphone Driver
 - 40mW output power on 16Ω / 3.3V
 - SNR 96dB, THD -79dB at 20mW with 16Ω load
- On-chip BTL Earpiece Driver (mono)
- Stereo and Mono Line-in mix into DAC output
- Separately Mixed Stereo and Mono Outputs
- Digital Tone Control and Bass Boost
- Low Power
 - Down to 7mW for stereo playback (1.8V / 1.5V supplies)
 - 10μW Shutdown Mode
- Low Supply Voltages
 - Analogue and Digital I/O: 1.8V to 3.6V
 - Digital core: 1.42V to 3.6V
- Master clocks supported: GSM, CDMA, PDC, USB or standard audio clocks
- Audio sample rates supported: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 88.2, 96kHz
- 28-lead QFN package, 4x4x0.75mm size
- Software compatible with WM8750L, WM8751L, WM8955L

APPLICATIONS

- Smartphone / Multimedia Phone
- Digital Audio Player

PIN DESCRIPTION

PIN NO	NAME	TYPE	DESCRIPTION
1	MCLK	Digital Input	Master Clock
2	DCVDD	Supply	Digital Core Supply
3	DBVDD	Supply	Digital Buffer (I/O) Supply
4	DGND	Supply	Digital Ground (return path for both DCVDD and DBVDD)
5	BCLK	Digital Input / Output	Audio Interface Bit Clock
6	DACDAT	Digital Input	DAC Digital Audio Data
7	DACLRC	Digital Input / Output	Audio Interface Left / Right Clock
8	PLLGND	Supply	Internally connected to AGND. Connect this pin to AGND externally for best PLL performance, or leave floating.
9	MONOOUT	Analogue Output	Mono Output
10	OUT3	Analogue Output	Output 3 (can be used as Headphone Pseudo Ground)
11	ROUT1	Analogue Output	Right Output 1 (Line or Headphone)
12	LOUT1	Analogue Output	Left Output 1 (Line or Headphone)
13	HPGND	Supply	Supply for Analogue Output Drivers (LOUT1/2, ROUT1/2)
14	ROUT2	Analogue Output	Right Output 2 (Line or Headphone or Earpiece)
15	LOUT2	Analogue Output	Left Output 2 (Line or Headphone or Earpiece)
16	HPVDD	Supply	Supply for Analogue Output Drivers (LOUT1/2, ROUT1/2, MONOOUT)
17	AVDD	Supply	Analogue Supply
18	AGND	Supply	Analogue Ground (return path for AVDD)
19	VREF	Analogue Output	Reference Voltage Decoupling Capacitor
20	VMID	Analogue Output	Midrail Voltage Decoupling Capacitor
21	MONOIN-	Analogue Input	Negative end of MONOIN+, for differential mono signals
22	MONOIN+	Analogue Input	Analogue Line-in to mixers (mono channel)
23	LINEINR	Analogue Input	Analogue Line-in to mixers (right channel)
24	LINEINL	Analogue Input	Analogue Line-in to mixers (left channel)
25	MODE	Digital Input	Control Interface Selection
26	CSB	Digital Input	Chip Select / Device Address Selection
27	SDIN	Digital Input/Output	Control Interface Data Input / 2-wire Acknowledge output
28	SCLK	Digital Input	Control Interface Clock Input

ABSOLUTE MAXIMUM RATINGS

Absolute Maximum Ratings are stress ratings only. Permanent damage to the device may be caused by continuously operating at or beyond these limits. Device functional operating limits and guaranteed performance specifications are given under Electrical Characteristics at the test conditions specified.

ESD Sensitive Device. This device is manufactured on a CMOS process. It is therefore generically susceptible to damage from excessive static voltages. Proper ESD precautions must be taken during handling and storage of this device.

Wolfson tests its package types according to IPC/JEDEC J-STD-020B for Moisture Sensitivity to determine acceptable storage conditions prior to surface mount assembly. These levels are:

MSL1 = unlimited floor life at <30°C / 85% Relative Humidity. Not normally stored in moisture barrier bag.

MSL2 = out of bag storage for 1 year at <30°C / 60% Relative Humidity. Supplied in moisture barrier bag.

MSL3 = out of bag storage for 168 hours at <30°C / 60% Relative Humidity. Supplied in moisture barrier bag.

The Moisture Sensitivity Level for each package type is specified in Ordering Information.

CONDITION	MIN	MAX
Supply voltages	-0.3V	+4.5V
Voltage range digital inputs	DGND -0.3V	DBVDD +0.3V
Voltage range analogue inputs	AGND -0.3V	AVDD +0.3V
Operating temperature range, T _A	-25°C	+85°C
Storage temperature after soldering	-65°C	+150°C

Notes

1. Analogue and digital grounds must always be within 0.3V of each other.
2. All digital and analogue supplies are completely independent from each other.

RECOMMENDED OPERATING CONDITIONS

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Digital supply range (Core)	DCVDD		1.42		3.6	V
Digital supply range (Buffer)	DBVDD		1.71		3.6	V
Analogue supplies range	AVDD, HPVDD		1.8		3.6	V
Ground	DGND, AGND, HPGND			0		V

Notes

1. The DCVDD voltage must be lower than or equal to the DBVDD voltage.

ELECTRICAL CHARACTERISTICS

Test Conditions

DCVDD = 1.5V, AVDD = HPVDD = 3.3V, T_A = +25°C, 1kHz signal, fs = 48kHz, 24-bit audio data unless otherwise stated.

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
DAC to Line-Out (10kΩ / 50pF load)						
Signal to Noise Ratio (A-weighted)	SNR	AVDD = 3.3V (L/ROUT1 and L/ROUT2)	90	98		dB
		AVDD = 1.8V (L/ROUT2 only)	89	95		
Total Harmonic Distortion	THD	AVDD = 3.3V (L/ROUT1 and L/ROUT2)		-86	-75	dB
		AVDD = 1.8V (L/ROUT2 only)		-82	-60	
Channel Separation		1kHz signal		100		dB
Analogue Mixer Inputs (LINEINL/R to L/ROUT1 with 10kΩ / 50pF load)

Input LOW Level	V_{IL}				$0.3 \times DBVDD$	V
Output HIGH Level	V_{OH}	$I_{OH} = -1mA$	$0.9 \times DBVDD$			V
Output LOW Level	V_{OL}	$I_{OL} = 1mA$			$0.1 \times DBVDD$	V

TERMINOLOGY

1. Signal-to-noise ratio (dB) - SNR is a measure of the difference in level between the full scale output and the output with no signal applied. (No Auto-zero or Automute function is employed in achieving these results).
2. Dynamic range (dB) - DR is a measure of the difference between the highest and lowest portions of a signal. Normally a THD+N measurement at 60dB below full scale. The measured signal is then corrected by adding the 60dB to it. (e.g. THD+N @ -60dB= -32dB, DR= 92dB).
3. THD+N (dB) - THD+N is a ratio, of the rms values, of (Noise + Distortion)/Signal.
4. Channel Separation (dB) - Also known as Cross-Talk. This is a measure of the amount one channel is isolated from the other. Normally measured by sending a full scale signal down one channel and measuring the other.

OUTPUT PGA'S LINEARITY

HEADPHONE OUTPUT THD VERSUS POWER

POWER CONSUMPTION

The power consumption of the WM8955BL depends on the following factors.

- Supply voltages: Reducing the supply voltages also reduces supply currents, and therefore results in significant power savings.
- Operating mode: Power consumption is lower in mono modes than in stereo, as one DAC is switched OFF. Unused analogue outputs should be switched off.

INTERNAL POWER ON RESET CIRCUIT

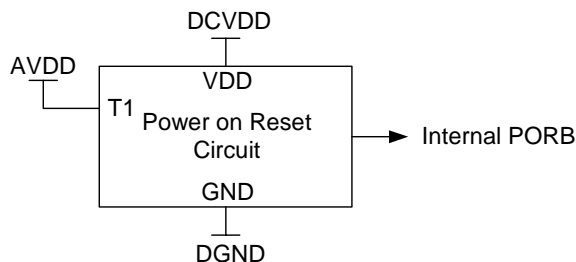

Figure 6 Internal Power on Reset Circuit Schematic

The WM8955BL includes an internal Power-On-Reset Circuit, as shown in Figure 6, which is used to reset the digital logic into a default state after power up. The power on reset circuit is powered from DCVDD and monitors DCVDD and AVDD. It asserts PORB low if DCVDD or AVDD are below a minimum threshold.

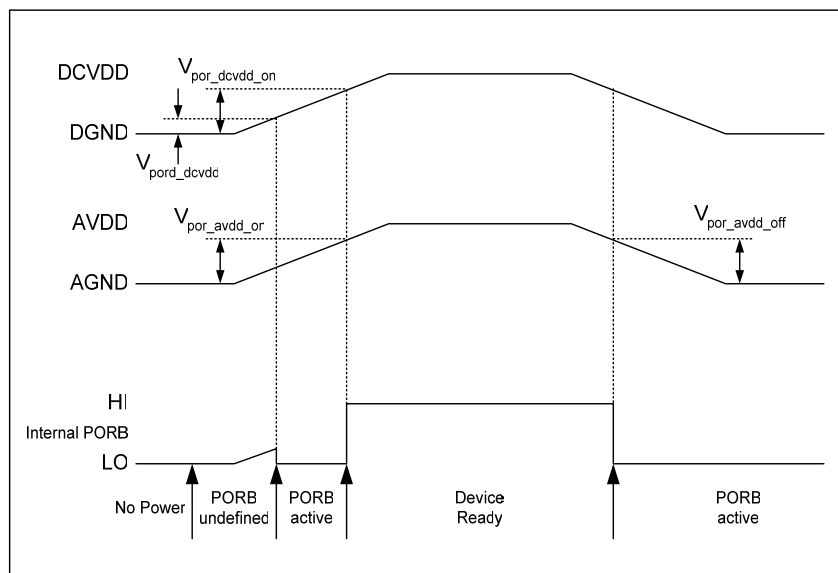

Figure 7 Typical Power-Up Sequence

Figure 7 shows a typical power-up sequence. When DCVDD and AVDD rise above the minimum thresholds, $V_{por_dcddd_on}$ and $V_{por_avddd_on}$, there is enough voltage for the circuit to guarantee the Power on Reset is asserted low and the chip is held in reset. In this condition, all writes to the control interface are ignored. When DCVDD rises to $V_{por_dcddd_on}$ and AVDD rises to $V_{por_avddd_on}$, PORB is released high and all registers are in their default state and writes to the control interface may take place. If DCVDD and AVDD rise at different rates then PORB will only be released when DCVDD and AVDD have both exceeded the $V_{por_dcddd_on}$ and $V_{por_avddd_on}$ thresholds.

On power down, PORB is asserted low whenever DCVDD drops below the minimum threshold $V_{por_dcddd_off}$ or AVDD drops below the minimum threshold $V_{por_avddd_off}$.

SYMBOL	MIN	TYP	MAX	UNIT
V_{por_dcddd}	0.4	0.6	0.8	V
$V_{por_dcddd_on}$	0.9	1.26	1.6	V
$V_{por_avddd_on}$	0.5	0.7	0.9	V
$V_{por_avddd_off}$	0.4	0.6	0.8	V

Table 2 Typical POR Operation (typical values, not tested)

DEVICE DESCRIPTION

INTRODUCTION

The WM8955BL is a low power audio DAC offering a combination of high quality audio, advanced features, low power and small size. These characteristics make it ideal for portable digital audio applications such as portable music players and smartphones.

The device has a configurable digital audio interface where digital audio data is fed to the internal digital filters and then the DAC. The interface supports a number of audio data formats including I²S, DSP Mode (a burst mode in which frame sync plus 2 data packed words are transmitted), Left Justified and Right Justified formats, and can operate in master or slave modes.

The on-chip digital filters perform tone control and digital volume control according to the user setting, and convert the audio data into oversampled bitstreams, which are passed to the left and right channel DACs. A multi-bit, low-order $\Sigma\Delta$ DAC architecture with dynamic element matching is used, delivering optimum performance with low power consumption.

The DAC output signal enters an analogue mixer where analogue input signals can be added to it. The WM8955BL has a total of six analogue output pins, which can be configured as stereo line-outs, mono line-outs, differential mono line-outs, stereo headphone outputs or differential mono (BTL) earpiece outputs.

The WM8955BL includes an on-chip PLL to generate commonly used audio rates, such as 48kHz and 44.1kHz, from system clocks found in GSM, CDMA and PDC phones and other portable systems.

To allow full software control over all its features, the WM8955BL offers a choice of 2 or 3 wire MPU control interface. It is fully compatible and an ideal partner for a wide range of industry standard microprocessors, controllers and DSPs.

The design of the WM8955BL has given much attention to power consumption without compromising performance. It operates at very low voltages, and includes the ability to power off parts of the circuitry under software control, including standby and power off modes.

SIGNAL PATH

The WM8955BL signal paths consists of digital filters, DACs, analogue mixers and output drivers. Each circuit block can be enabled or disabled separately using the control bits in register 26 (see "Power Management"). Thus it is possible to utilise the analogue mixing and amplification provided by the WM8955BL, irrespective of whether the DACs are running or not.

The WM8955BL receives digital input data on the DACDAT pin. The digital filter block processes the data to provide the following functions:

- Digital volume control
- Tone control and Bass Boost
- Digital Mono Mix
- Sigma-Delta Modulation

Two high performance, sigma-delta audio DACs convert the digital data into two analogue signals (left and right). These can then be mixed with analogue signals from the LINEINL, LINEINR and MONOIN pins, and the mix is fed to the output drivers, LOUT1/ROUT1, LOUT2/ROUT2, MONOOUT and OUT3.

- LOUT1/ROUT1: can drive 16 Ω or 32 Ω stereo headphones or stereo line output.
- LOUT2/ROUT2: can drive a 32 Ω earpiece, stereo headphones or a stereo line-out.
- MONOOUT: line output designed to drive a 10k Ω load.
- OUT3: multi-function output, may be used for capacitor-less headphone drive, differential mono-out, line-out or 32 Ω earpiece driver.

DIGITAL VOLUME CONTROL

The WM8955BL has on-chip digital attenuation from -127dB to 0dB in 0.5dB steps, allowing the user to adjust the volume of each channel separately. The level of attenuation for an eight-bit code X is given by:

$$-0.5 \times (255 - X) \text{ dB for } 1 \leq X \leq 255; \quad \text{MUTE for } X = 0$$

The LDVU and RDVU control bits control the loading of digital volume control data. When LDVU or RDVU are set to 0, the LDACVOL or RDACVOL control data is loaded into an intermediate register, but the actual gain does not change. Both left and right gain settings are updated simultaneously when either LDVU or RDVU are set to 1.

Table 3 Digital Volume Control

TONE CONTROL

The WM8955BL provides separate controls for bass and treble with programmable gains and filter characteristics. This function operates on digital audio data before it is passed to the audio DACs.

Bass control can take two different forms:

- Linear bass control: bass signals are amplified or attenuated by a user programmable gain. This is independent of signal volume, and very high bass gains on loud signals may lead to signal clipping.
- Adaptive bass boost: The bass volume is amplified by a variable gain. When the bass volume is low, it is boosted more than when the bass volume is high. This method is recommended because it prevents clipping, and usually sounds more pleasant to the human ear.

Treble control applies a user programmable gain, without any adaptive boost function.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R12 (0Ch) Bass Control	7	BB	0	Bass Mode 0 = Linear bass control 1 = Adaptive bass boost

Table 4 Tone Control

Note:

All cut-off frequencies change proportionally with the DAC sample rate.

DIGITAL TO ANALOGUE CONVERTER (DAC)

Treble and linear bass enhancement may produce signals that exceed full-scale. In order to avoid limiting under these conditions, it is recommended to set the DAT bit to attenuate the digital input signal by 6dB. The gain at the outputs should be increased by 6dB to compensate for the attenuation. Cut-only tone adjustment and adaptive bass boost cannot produce signals above full-scale and therefore do not require the DAT bit to be set.

After passing through the tone control filters, digital 'de-emphasis' can be applied to the audio data if necessary (e.g. when the data comes from a CD with pre-emphasis used in the recording). De-emphasis filtering is available for sample rates of 48kHz, 44.1kHz and 32kHz.

The WM8955BL also has a Soft Mute function, which gradually attenuates the volume of the digital signal to zero. This function is enabled by default. To play back an audio signal, the WM8955BL must first be unmuted by setting the DACMU bit to zero.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

Table 5 DAC Control

The digital audio data is converted to oversampled bit streams in the on-chip, true 24-bit digital interpolation filters. The bitstream data enters two multi-bit, sigma-delta DACs, which convert them to high quality analogue audio signals. The multi-bit DAC architecture reduces high frequency noise and sensitivity to clock jitter. It also uses a Dynamic Element Matching technique for high linearity and low distortion.

In normal operation, the left and right channel digital audio data are converted to analogue in two separate DACs. However, it is also possible to disable one channel, so that the same signal (left or right) appears on both analogue output channels. Additionally, there is a mono-mix mode where the two audio channels are mixed together digitally and then converted to analogue using only one DAC, while the other DAC is switched off. The mono-mix signal can be selected to appear on both analogue output channels (see Analogue Outputs).

The DAC output defaults to non-inverted. Setting DACINV will invert the DAC output phase on both left and right channels.

Table 6 DAC Mono Mix Select

LINE INPUTS AND OUTPUT MIXERS

The WM8955BL provides the option to mix the DAC output signal with analogue line-in signals from the LINEINL, LINEINR and MONOIN+ and MONOIN- pins. The level of the mixed-in signals can be controlled with PGAs (Programmable Gain Amplifiers).

LINEINL, LINEINR, MONOIN+ and MONOIN- are high impedance, low capacitance AC coupled analogue inputs. They are biased internally to the reference voltage VREF. Whenever these inputs are muted or the device placed into standby mode, the inputs remain biased to VREF using special anti-thump circuitry. This reduces any audible clicks that may otherwise be heard when re-activating the inputs.

The mono mixer is designed to allow a number of signal combinations to be mixed, including the possibility of mixing both the right and left channels together to produce a mono output. To prevent overloading of the mixer when full-scale DAC left and right signals are input, the mixer inputs from the DAC outputs each have a fixed gain of -6dB. The bypass path inputs to the mono mixer have variable gain as determined by R38/R39 bits [6:4].

Table 9 Mono Output Mixer Control

Note:

The mono mixer has half the gain of the left and right mixers (i.e. 6dB less), to ensure that the left and right channels can be mixed to mono without clipping.

DIFFERENTIAL MONO LINE-IN

The WM8955BL can take either a single-ended or a differential mono signal and mix it into the LOUT1/2 and ROUT1/2 outputs. In both cases, LINEINL and LINEINR still remain available as stereo line-in. Differential mono input mode is enabled by setting the DMEN bit, as shown below.

ANALOGUE OUTPUTS

ENABLING THE OUTPUTS

Each analogue output of the WM8955BL can be separately enabled or disabled. The analogue mixer associated with each output is powered on or off along with the output pin. All outputs are disabled by default. To save power, unused outputs should remain disabled.

Outputs can be enabled at any time, except when the WM8955BL is in OFF mode, as this may cause pop noise (see Minimising Pop Noise at the Analogue Outputs)

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R26 (1Ah) Power Management (2)	6	LOUT1	0	0 = LOUT1 disabled 1 = LOUT1 enabled
	5	ROUT1	0	0 = ROUT1 disabled 1 = ROUT1 enabled
	4	LOUT2	0	0 = LOUT2 disabled 1 = LOUT2 enabled

	2	MONO	0	0 = MONOOUT disabled 1 = MONOOUT enabled
	1	OUT3	0	0 = OUT3 disabled 1 = OUT3 enabled

Table 11 Analogue Output Control

Whenever an analogue output is disabled, it remains connected to VREF through an internal resistor. This helps to prevent pop noise when the output is re-enabled. The resistance between VREF and each output can be controlled using the VROI bit in register 27. The default is low (1.5kΩ), so that any capacitors on the outputs can charge up quickly at start-up. If a high impedance is desired for disabled outputs, VROI can then be set to 1, increasing the resistance to about 40kΩ.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R27 (1Bh) Additional (3)	6	VROI	0	VREF to analogue output resistance 0: 1.5 kΩ 1: 40 kΩ

Table 12 Disabled Outputs to VREF Resistance

THERMAL SHUTDOWN

The earpiece and headphone outputs can drive very large currents. To protect the WM8955BL from overheating, a thermal shutdown circuit is included. If the device temperature reaches approximately 150°C and the thermal shutdown circuit is enabled (TSDEN = 1) then the output amplifiers (outputs OUT1L/R, OUT2L/R & OUT3) will be disabled.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R23 (17h) Additional (1)	8	TSDEN	0	Thermal Shutdown Enable 0 : thermal shutdown disabled 1 : thermal shutdown enabled

Table 13 Thermal Shutdown

LOUT1/ROUT1 OUTPUTS

The LOUT1 and ROUT1 pins can drive a 16 Ω or 32 Ω headphone or a line output (see Headphone Output and Line Output sections, respectively). The signal volume on LOUT1 and ROUT1 can be independently adjusted under software control by writing to LOUT1VOL and ROUT1VOL, respectively. Note that gains over 0dB may cause clipping if the signal is large. Any gain setting below 0101111 (minimum gain) mutes the output driver. The corresponding output pin remains at the same DC level (the reference voltage on the VREF pin), so that no click noise is produced when muting or un-muting.

The analogue outputs have a zero cross detect feature to minimize audible clicks and zipper noise when on gain changes (i.e. the updating of the gain value is delayed until the signal passes through zero). By default, this includes a time-out function, which forces the gain to update if no zero crossing occurs within a certain period of time.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

Table 14 LOUT1/ROUT1 Volume Control

LOUT2/ROUT2 OUTPUTS

The LOUT2 and ROUT2 output pins are essentially similar to LOUT1 and ROUT1, but they are independently controlled and can drive an 32Ω BTL earpiece. For BTL drive, the ROUT2 signal must be inverted (ROUT2INV = 1), so that the left and right channel are mixed to mono in the earpiece [L-(-R)] = L+R].

DIGITAL AUDIO INTERFACE

The digital audio interface is used for feeding audio data into the WM8955BL. It uses three pins:

- DACDAT: DAC data input
- DACLRC: DAC data alignment clock
- BCLK: Bit clock, for synchronisation

The clock signals BCLK and DACLRC can be outputs when the WM8955BL operates as a master, or inputs when it is a slave (see Master and Slave Mode Operation, below).

Four different audio data formats are supported:

- Left justified
- Right justified
- I²S
- DSP mode

All four of these modes are MSB first. They are described in Audio Data Formats, below. Refer to the Electrical Characteristic section for timing information.

MASTER AND SLAVE MODE OPERATION

The WM8955BL can be configured as either a master or slave mode device. As a master device the WM8955BL generates BCLK and DACLRC and thus controls sequencing of the data transfer on DACDAT. In slave mode, the WM8955BL responds with data to clocks it receives over the digital audio interface. The mode can be selected by writing to the MS control bit. Master and slave modes are illustrated below.

Figure 10 Master Mode

Figure 11 Slave Mode

AUDIO DATA FORMATS

In Left Justified mode, the MSB is available on the first rising edge of BCLK following a DACLRC transition. The other bits up to the LSB are then transmitted in order. Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles before each DACLRC transition.

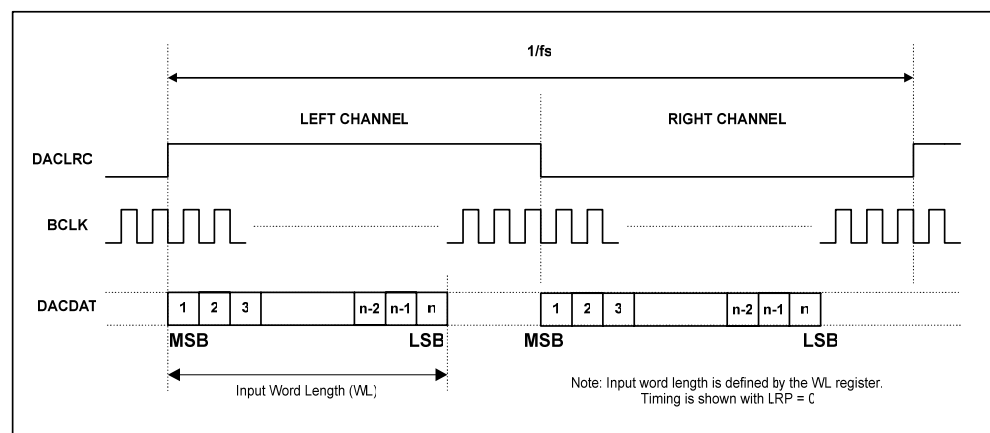

Figure 12 Left Justified Audio Interface (assuming n-bit word length)

In Right Justified mode, the LSB is available on the last rising edge of BCLK before a DACLRC transition. All other bits are transmitted before (MSB first). Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles after each DACLRC transition.

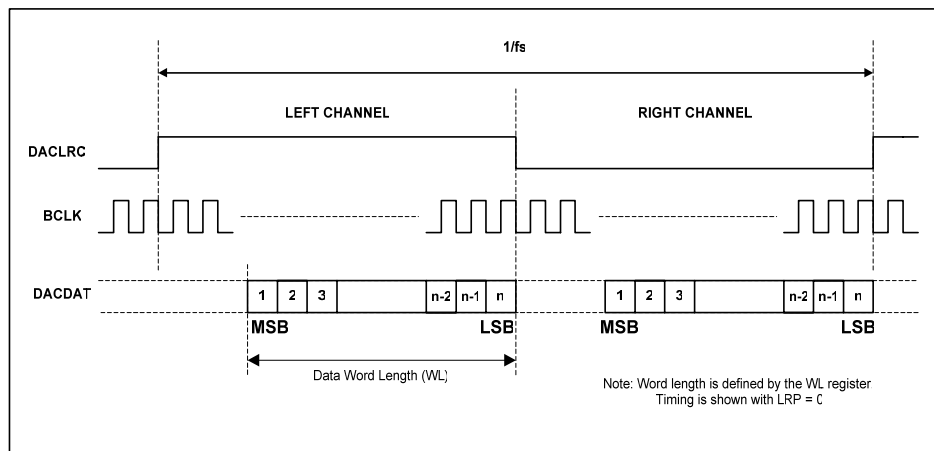

Figure 13 Right Justified Audio Interface (assuming n-bit word length)

In I²S mode, the MSB is available on the second rising edge of BCLK following a DACLRC transition. The other bits up to the LSB are then transmitted in order. Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles between the LSB of one sample and the MSB of the next.

Figure 14 I²S Justified Audio Interface (assuming n-bit word length)

In DSP mode, the left channel MSB is available on either the first or second rising edge of BCLK (selectable by LRP) following a rising edge of DACLRC. Right channel data immediately follows left channel data. Depending on word length, BCLK frequency and sample rate, there may be unused BCLK cycles between the LSB of the right channel data and the next sample.

MASTER CLOCK AND PHASE LOCKED LOOP

The WM8955BL has an on-chip phase-locked loop (PLL) circuit that can be used to:

- generate a master clock for the WM8955BL audio function from another external clock, e.g. in telecoms applications.

The PLL circuit is shown below.

Figure 17 PLL Circuit

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION

	3	PLEN	0	PLL Enable 0: PLL disabled; 1: PLL enabled.

Table 19 PLL and Clocking Control

The PLL frequency ratio $R = f_2/f_1$ (see Figure 17) can be set using K and N in registers 44 (2Ch) to 46 (2Eh):

$$N = \text{int}(R)$$

$$K = \text{int}(2^{22} (R-N))$$

Example:

$$\text{MCLK} = 12\text{MHz required clock} = 12.288\text{MHz}$$

R should be chosen to ensure $5 < N < 13$. There is a divide by 4 and selectable divide by 2 after the PLL which should be set to meet this requirement. Enabling the divide by 2 sets the required $f_2 = 8 \times 12.288\text{MHz} = 98.304\text{MHz}$.

$$R = 98.304/12 = 8.192$$

$$N = \text{int}R = 8$$

$$K = \text{int}(2^{22} \times (8.192-8)) = 805306 = \text{C49BAh.}$$

Table 21 PLL Frequency Examples

AUDIO SAMPLE RATES

The WM8955BL supports a wide range of master clock frequencies and can generate many commonly used audio sample rates directly from the master clock.

There are two clocking modes:

- 'Normal' mode supports master clocks of 128f_s, 192f_s, 256f_s, 384f_s, and their multiples
- USB mode supports 12MHz or 24MHz master clocks. This mode is intended for use in systems with a USB interface, and can run without a PLL.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R8 (08h) Sample Rates	0	USB	0	Clocking Mode Select 1: USB Mode 0: 'Normal' Mode
	5:1	SR [4:0]	00000	Sample Rate Control
	6	MCLK DIV2	0	MCLK Divide by 2 0: Divide disabled 1: Divide enabled
	7	BCLKDIV2	0	Divide BITCLK output by 2 (use only in USB master mode, i.e. when USB=1, MS=1) 1 = BCLK is divided by 2 (Note 1) 0 = BCLK is not divided

Table 22 Clocking and Sample Rate Control

Note:

1. With BCLKDIV2=1, the LRCLK output produces a non-50:50 duty cycle if BCLK/LRCLK is not an even integer.

The clocking of the WM8955BL is controlled using the MCLKDIV2, USB, and SR control bits. Setting the MCLKDIV2 bit divides MCLK by two internally. The USB bit selects between 'Normal' and USB mode. Each combination of the SR4 to SR0 control bits selects one MCLK division ratio and hence one sample rate (see Table 23). The digital filter characteristics are automatically adjusted to suit the MCLK and sample rate selected (see Digital Filter Characteristics).

Since all sample rates are generated by dividing MCLK, their accuracy depends on the accuracy of MCLK. If MCLK changes, the sample rates change proportionately. Note that some sample rates (e.g. 44.1kHz in USB mode) are approximated, i.e. they differ from their target value by a very small amount. This is not audible, as the maximum deviation is only 0.27% (8.0214kHz instead of 8kHz in USB mode – for comparison, a half-tone step corresponds to a 5.9% change in pitch).

Table 23 Master Clock and Sample Rates

CONTROL INTERFACE

SELECTION OF CONTROL MODE

The WM8955BL is controlled by writing to registers through a serial control interface. A control word consists of 16 bits. The first 7 bits (B15 to B9) are address bits that select which control register is accessed. The remaining 9 bits (B8 to B0) are register bits, corresponding to the 9 bits in each control register. The control interface can operate as either a 3-wire or 2-wire MPU interface. The MODE pin selects the interface format.

MODE	INTERFACE FORMAT
Low	2 wire
High	3 wire

Table 24 Control Interface Mode Selection

3-WIRE SERIAL CONTROL MODE

In 3-wire mode, every rising edge of SCLK clocks in one data bit from the SDIN pin. A rising edge on CSB latches in a complete control word consisting of the last 16 bits.

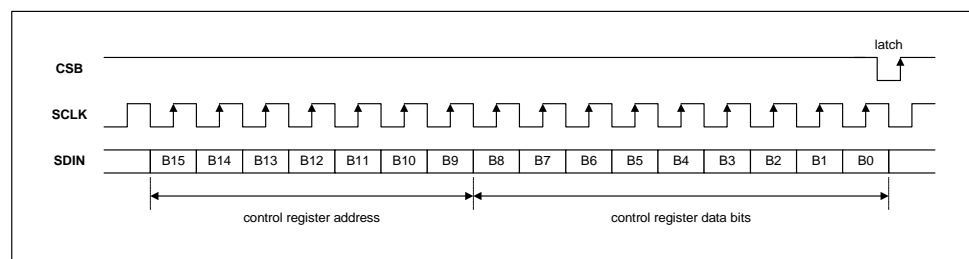

Figure 18 3-Wire Serial Control Interface

2-WIRE SERIAL CONTROL MODE

The WM8955BL supports software control via a 2-wire serial bus. Many devices can be controlled by the same bus, and each device has a unique 7-bit address (this is not the same as the 7-bit address of each register in the WM8955BL).

The WM8955BL operates as a slave device only. The controller indicates the start of data transfer with a high to low transition on SDIN while SCLK remains high. This indicates that a device address and data will follow. All devices on the 2-wire bus respond to the start condition and shift in the next eight bits on SDIN (7-bit address + Read/Write bit, MSB first). If the device address received matches the address of the WM8955BL and the R/W bit is '0', indicating a write, then the WM8955BL responds by pulling SDIN low on the next clock pulse (ACK). If the address is not recognised or the R/W bit is '1', the WM8955BL returns to the idle condition and wait for a new start condition and valid address.

Once the WM8955BL has acknowledged a correct address, the controller sends the first byte of control data (B15 to B8, i.e. the WM8955BL register address plus the first bit of register data). The WM8955BL then acknowledges the first data byte by pulling SDIN low for one clock pulse. The controller then sends the second byte of control data (B7 to B0, i.e. the remaining 8 bits of register data), and the WM8955BL acknowledges again by pulling SDIN low.

The transfer of data is complete when there is a low to high transition on SDIN while SCLK is high. After receiving a complete address and data sequence the WM8955BL returns to the idle state and waits for another start condition. If a start or stop condition is detected out of sequence at any point during data transfer (i.e. SDIN changes while SCLK is high), the device jumps to the idle condition.

Figure 19 2-Wire Serial Control Interface

The WM8955BL has two possible device addresses, which can be selected using the CSB pin.

CSB STATE	DEVICE ADDRESS
Low	0011010
High	0011011

Table 25 2-Wire MPU Interface Address Selection

POWER SUPPLIES

The WM8955BL can use up to four separate power supplies:

- AVDD / AGND: Analogue supply, powers all analogue functions except the headphone drivers. AVDD can range from 1.8V to 3.6V and has the most significant impact on overall power consumption (except for power consumed in the headphone). A large AVDD slightly improves audio quality.
- HPVDD / HPGND: Headphone supply, powers the headphone drivers. HPVDD is normally tied to AVDD, but it requires separate layout and decoupling capacitors to curb harmonic distortion. If HPVDD is lower than AVDD, the output signal may be clipped.
- DCVDD: Digital core supply, powers all digital functions except the audio and control interfaces. DCVDD can range from 1.42V to 3.6V, and has no effect on audio quality. The return path for DCVDD is DGND, which is shared with DBVDD.
- DBVDD: Digital buffer supply, powers the audio and control interface buffers. This makes it possible to run the digital core at very low voltages, saving power, while interfacing to other digital devices using a higher voltage. DBVDD draws much less power than DCVDD, and has no effect on audio quality. The return path for DBVDD is DGND, which is shared with DCVDD.

It is possible to use the same supply voltage on all four. However, digital and analogue supplies should be routed and decoupled separately to keep digital switching noise out of the analogue signal paths.

POWER MANAGEMENT

The WM8955BL has two control registers that allow users to select which functions are active. For minimum power consumption, unused functions should be disabled. To avoid any pop or click noise, it is important to enable or disable functions in the correct order (see Applications Information)

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R25 (19h) Power Management (1)	8:7	VMIDSEL	00	VMID resistor divider select 00 – VMID disabled 01 – 50k Ω divider enabled 10 – 500k Ω divider enabled 11 – 5k Ω divider enabled (for fast start-up)

R26 (1Ah) Power Management (2)	8	DACL	0	DAC Left Enable 0=off 1=on
	7	DACR	0	DAC Right Enable 0=off 1=on
	6	LOUT1	0	LOUT1 Output Buffer* Enable 0=off 1=on
	5	ROUT1	0	ROUT1 Output Buffer* Enable 0=off 1=on
	4	LOUT2	0	LOUT2 Output Buffer* Enable 0=off 1=on
	3	ROUT2	0	ROUT2 Output Buffer* Enable 0=off 1=on
	2	MOUT	0	MONOOUT Output Buffer and Mono Mixer Enable 0=off 1=on
	1	OUT3	0	OUT3 Output Buffer Enable 0=off 1=on
Note: * The left mixer is enabled when LOUT1=1 or LOUT2=1. The right mixer is enabled when ROUT1=1 or ROUT2=1.				

Table 26 Power Management

STOPPING THE MASTER CLOCK

In order to minimise power consumed in the digital core of the WM8955BL, the master clock should be stopped in Standby and OFF modes. If this cannot be done externally at the clock source, the DIGENB bit (R25, bit 0) can be set to stop the MCLK signal from propagating into the device core. However, since setting DIGENB has no effect on the power consumption of other system components external to the WM8955BL, it is preferable to disable the master clock at its source wherever possible.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R25 (19h) Power Management (1)	0	DIGENB	0	Master clock disable 0: master clock enabled 1: master clock disabled

Table 27 ADC and DAC Oversampling Rate Selection

NOTE: Before DIGENB can be set, the control bits DACL and DACR must be set to zero and a waiting time of 1ms must be observed. Any failure to follow this procedure may prevent DACs and ADCs from re-starting correctly.

OVERSAMPLING RATE

By default, the oversampling rate of the DAC digital filters is 128x. However, this can be changed to 64x by writing to the DACOSR bit. In the 64x oversampling mode, the digital filters consume less power. However, the signal-to-noise ratio is slightly reduced.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R24 (18h) Additional Control (2)	0	DACOSR	0	DAC oversample rate select 1 = 64x (lowest power) 0 = 128x (best SNR)

Table 28 Oversampling Rate Selection

SAVING POWER AT LOW SUPPLY VOLTAGES

The analogue supplies to the WM8955BL can run from 1.8V to 3.6V. By default, all analogue circuitry on the device is optimized to run at 3.3V. This set-up is also good for all other supply voltages down to 1.8V. However, at lower voltages, it is possible to save power by reducing the internal bias currents used in the analogue circuitry. This is controlled as shown below.

REGISTER ADDRESS	BIT	LABEL	DEFAULT	DESCRIPTION
R23 (17h) Additional Control(1)	7:6	VSEL[1:0]	11	Analogue Bias optimization 00 : Lowest bias current, optimized for 1.8V 01 : Low bias current, optimized for 2.5V 10, 11 : Default bias current, optimized for 3.3V

DIGITAL FILTER CHARACTERISTICS

Depending on the MCLK frequency and sample rate selected, 4 different types of digital filter can be used in the DAC, called Type 0, 1, 2 and 3 (see “Master Clock and Audio Sample Rates”). The performance of Types 0 and 1 is listed in the table below, the responses of all filters is shown in the following pages.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
DAC Filter Type 0 (USB mode, 250fs operation)					
Passband	+/- 0.03dB	0		0.416fs	
	-6dB		0.5fs		
Passband Ripple				+/-0.03	dB
Stopband		0.584fs			
Stopband Attenuation	$f > 0.584fs$	-50			dB
DAC Filter Type 1 (USB mode, 272fs or Normal mode operation)					
Passband	+/- 0.03dB	0		0.4535fs	
	-6dB		0.5fs		
Passband Ripple				+/- 0.03	dB
Stopband		0.5465fs			
Stopband Attenuation	$f > 0.5465fs$	-50			dB

APPLICATIONS INFORMATION

RECOMMENDED EXTERNAL COMPONENTS

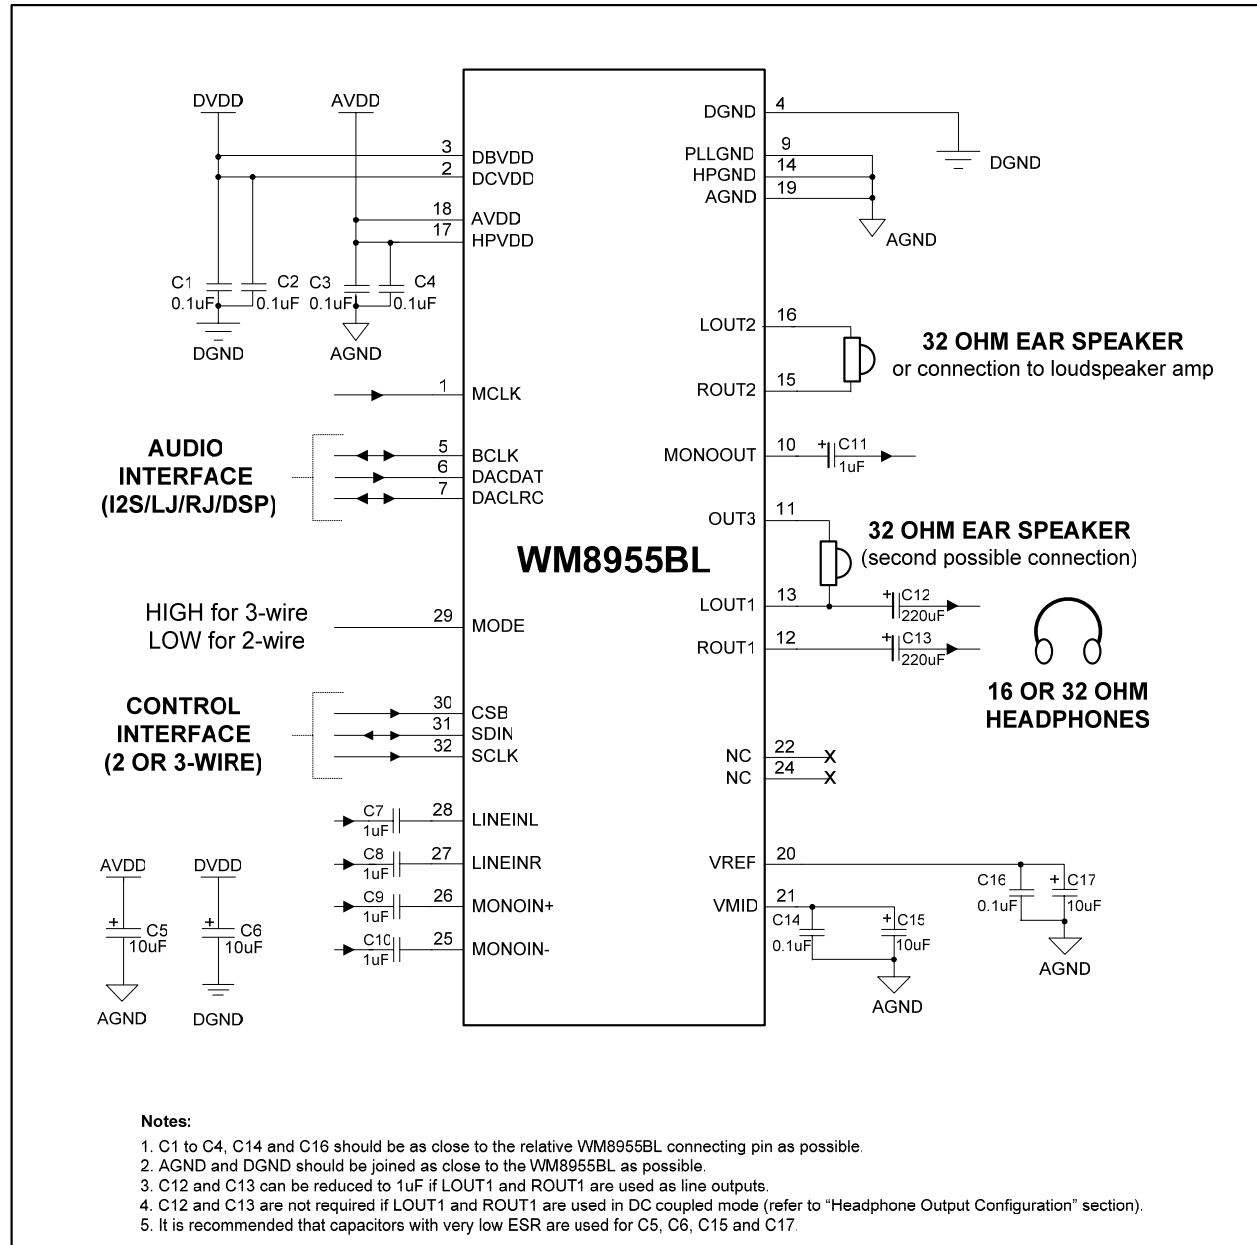

Figure 28 Recommended External Component Diagram

MINIMISING POP NOISE AT THE ANALOGUE OUTPUTS

To minimise any pop or click noise when the system is powered up or down, the following procedures are recommended.

POWER UP

- Switch on power supplies. By default the WM8955BL is in OFF Mode (i.e. only the control interface is powered up)
- Enable the reference voltage VREF by setting the WM8955BL to Standby mode. DO NOT enable any of the analogue outputs at this point.
- Allow VREF to settle. The settling time depends on the value of the capacitor connected at VMID, and the size of the resistors selected using VMIDSEL ($\tau = RC$).
- Enable DACs, etc. as required.
- Enable outputs required.
- Set DACMU = 0 to soft-un-mute the audio DACs.

POWER DOWN

- Set DACMU = 1 to soft-mute the audio DACs.
- Disable outputs.
- Switch off the power supplies.

LINE OUTPUT CONFIGURATION

All the analogue outputs, LOUT1/ROUT1, LOUT2/ROUT2, and MONOOUT, can be used as line outputs. Recommended external components are shown below.

Figure 29 Recommended Circuit for Line Output

The DC blocking capacitors and the load resistance together determine the lower cut-off frequency, f_c . Assuming a 10 k Ω load and $C_1, C_2 = 1\mu\text{F}$:

$$f_c = 1 / 2\pi (R_L + R_1) C_1 = 1 / (2\pi \times 10.1\text{k}\Omega \times 1\mu\text{F}) = 16 \text{ Hz}$$

Increasing the capacitance lowers f_c , improving the bass response. Smaller values of C_1 and C_2 will diminish the bass response. The function of R_1 and R_2 is to protect the line outputs from damage when used improperly.

HEADPHONE OUTPUT CONFIGURATION

The analogue outputs LOUT1/ROUT1, LOUT2/ROUT2, and OUT3 can drive a 16Ω or 32Ω headphone load, either through DC blocking capacitors, or DC coupled without any capacitor.

Headphone Output using DC blocking capacitors

DC Coupled Headphone Output
(OUT3SW = 00)

Figure 30 Recommended Headphone Output Configurations

When DC blocking capacitors are used, then their capacitance and the load resistance together determine the lower cut-off frequency, f_c . Increasing the capacitance lowers f_c , improving the bass response. Smaller capacitance values will diminish the bass response. Assuming a 16Ω load and $C1 = 220\mu\text{F}$:

$$f_c = 1 / 2\pi R_L C_1 = 1 / (2\pi \times 16\Omega \times 220\mu\text{F}) = 45 \text{ Hz}$$

In the DC coupled configuration, the headphone “ground” is connected to the OUT3 pin, which must be enabled by setting OUT3 = 1 and OUT3SW = 00. As the OUT3 pin produces a DC voltage of $AVDD/2$ (=VREF), there is no DC offset between LOUT1/ROUT1 and OUT3, and therefore no DC blocking capacitors are required. This saves space and material cost in portable applications.

It is recommended to connect the DC coupled headphone outputs only to headphones, and not to the line input of another device. Although the built-in short circuit protection will prevent any damage to the headphone outputs, such a connection may be noisy, and may not function properly if the other device is grounded.

EARPIECE OUTPUT CONFIGURATION

LOUT2 and ROUT2 can differentially drive a mono 32Ω earpiece as shown below.

Figure 31 Earpiece Output Connection

The right channel is inverted by setting the ROUT2INV bit, so that the signal across the earpiece is the sum of left and right channels.

Wolfson reserves the right to make changes to its products and specifications or to discontinue any product or service without notice. Customers should therefore obtain the latest version of relevant information from Wolfson to verify that the information is current.

Testing and other quality control techniques are utilised to the extent Wolfson deems necessary to support its warranty. Specific testing of all parameters of each device is not necessarily performed unless required by law or regulation.

In order to minimise risks associated with customer applications, the customer must use adequate design and operating safeguards to minimise inherent or procedural hazards. Wolfson is not liable for applications assistance or customer product design. The customer is solely responsible for its selection and use of Wolfson products. Wolfson is not liable for such selection or use nor for use of any circuitry other than circuitry entirely embodied in a Wolfson product.

Wolfson's products are not intended for use in life support systems, appliances, nuclear systems or systems where malfunction can reasonably be expected to result in personal injury, death or severe property or environmental damage. Any use of products by the customer for such purposes is at the customer's own risk.

Wolfson does not grant any licence (express or implied) under any patent right, copyright, mask work right or other intellectual property right of Wolfson covering or relating to any combination, machine, or process in which its products or services might be or are used. Any provision or publication of any third party's products or services does not constitute Wolfson's approval, licence, warranty or endorsement thereof. Any third party trade marks contained in this document belong to the respective third party owner.

Reproduction of information from Wolfson datasheets is permissible only if reproduction is without alteration and is accompanied by all associated copyright, proprietary and other notices (including this notice) and conditions. Wolfson is not liable for any unauthorised alteration of such information or for any reliance placed thereon.

Any representations made, warranties given, and/or liabilities accepted by any person which differ from those contained in this datasheet or in Wolfson's standard terms and conditions of sale, delivery and payment are made, given and/or accepted at that person's own risk. Wolfson is not liable for any such representations, warranties or liabilities or for any reliance placed thereon by any person.
