## ADJUSTABLE PRECISION SHUNT REGULATOR

### SUMMARY

### DESCRIPTION

The ZR431L is a three terminal adjustable shunt regulator offering excellent temperature stability and output current handling capability up to 25mA. The output voltage may be set to any chosen voltage between 1.24 and 10 volts by selection of two external divider resistors.

The devices can be used as a replacement for zener diodes in many applications requiring an improvement in zener performance.

The ZR431L is particularly used in the feedback control loop of switch mode power supplies. In this application the device 1.24 volt reference enables the generation of low voltage supplies, typically 3.3. volts or 3 volts.

### FEATURES

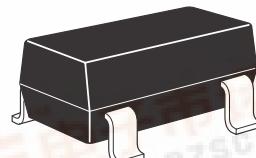

- 2.5% and 1% tolerance
- Max. temperature coefficient 50 ppm/ $^{\circ}\text{C}$
- Temperature compensated for operation over the full temperature range
- 100 $\mu\text{A}$  to 25mA current sink capability
- Surface mount SOT23 package
- TO92 package

### APPLICATIONS

- Switch mode power supplies
- Shunt regulator
- Series regulator
- Voltage monitor
- Over voltage / under voltage protection

BLOCK DIAGRAM

Deviation of reference input voltage,  $V_{dev}$ , is defined as the maximum variation of the reference input voltage over the full temperature range.

The average temperature coefficient of the reference input voltage,  $V_{ref}$  is defined as:

$$V_{ref}(\text{ppm } / \text{C}) = \frac{V_{dev} \times 1000000}{V_{ref}(T_1 - T_2)}$$

The dynamic output impedance,  $R_z$ , is defined as:

$$R_z = \frac{\Delta V_z}{\Delta I_z}$$

When the device is programmed with two external resistors,  $R_1$  and  $R_2$ , (fig 2), the dynamic output impedance of the overall circuit,  $R'$ , is defined as:

$$R' = R_z \left(1 + \frac{R_1}{R_2}\right)$$
