

**MICROCHIP****25AA080/25LC080/25C080****8K SPI™ Bus Serial EEPROM****Device Selection Table**

Part Number	Vcc Range	Max. Clock Frequency	Temp. Ranges
25AA080	1.8-5.5V	1 MHz	I
25LC080	2.5-5.5V	2 MHz	I
25C080	4.5-5.5V	3 MHz	I,E

**Features:**

- Low-power CMOS technology:
  - Write current: 3 mA maximum
  - Read current: 500  $\mu$ A typical
  - Standby current: 500 nA typical
- 1024 x 8-bit organization
- 16 byte page
- Write cycle time: 5 ms max.
- Self-timed erase and write cycles
- Block write protection:
  - Protect none, 1/4, 1/2 or all of array
- Built-in write protection:
  - Power-on/off data protection circuitry
  - Write enable latch
  - Write-protect pin
- Sequential read
- High reliability:
  - Endurance: 1 M cycles
  - Data retention: > 200 years
  - ESD protection: > 4000V
- 8-pin PDIP and SOIC (150 mil)
- Temperature ranges supported:
  - Industrial (I): -40°C to +85°C
  - Automotive (E) (25C080): -40°C to +125°C

**Description:**

The Microchip Technology Inc. 25AA080/25LC080/25C080 (25XX080\*) are 8 Kbit Serial Electrically Erasable PROMs. The memory is accessed via a simple Serial Peripheral Interface™ (SPI™) compatible serial bus. The bus signals required are a clock input (SCK) plus separate data in (SI) and data out (SO) lines. Access to the device is controlled through a Chip Select (CS) input.

Communication to the device can be paused via the hold pin (HOLD). While the device is paused, transitions on its inputs will be ignored, with the exception of chip select, allowing the host to service higher priority interrupts.

**Package Types****PDIP/SOIC****Block Diagram**

\*25XX080 is used in this document as a generic part number for the 25AA080/25LC080/25C080 devices.

SPI™ is a trademark of Motorola Inc.

## 2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

TABLE 2-1: PIN FUNCTION TABLE

Name	PDIP	SOIC	Function
$\overline{CS}$	1	1	Chip Select Input
SO	2	2	Serial Data Output
$\overline{WP}$	3	3	Write-Protect Pin
Vss	4	4	Ground
SI	5	5	Serial Data Input
SCK	6	6	Serial Clock Input
$\overline{HOLD}$	7	7	Hold Input
Vcc	8	8	Supply Voltage

### 2.1 Chip Select ( $\overline{CS}$ )

A low level on this pin selects the device. A high level deselects the device and forces it into Standby mode. However, a programming cycle which is already initiated or in progress will be completed, regardless of the  $\overline{CS}$  input signal. If  $\overline{CS}$  is brought high during a program cycle, the device will go into Standby mode as soon as the programming cycle is complete. When the device is deselected, SO goes to the high-impedance state, allowing multiple parts to share the same SPI bus. A low-to-high transition on  $\overline{CS}$  after a valid write sequence initiates an internal write cycle. After power-up, a low level on  $\overline{CS}$  is required prior to any sequence being initiated.

### 2.2 Serial Output (SO)

The SO pin is used to transfer data out of the 25XX080. During a read cycle, data is shifted out on this pin after the falling edge of the serial clock.

### 2.3 Write-Protect ( $\overline{WP}$ )

This pin is used in conjunction with the WPEN bit in the Status register to prohibit writes to the nonvolatile bits in the Status register. When WP is low and WPEN is high, writing to the nonvolatile bits in the Status register is disabled. All other operations function normally. When  $\overline{WP}$  is high, all functions, including writes to the nonvolatile bits in the Status register operate normally. If the WPEN bit is set,  $\overline{WP}$  low during a Status register write sequence will disable writing to the Status register. If an internal write cycle has already begun, WP going low will have no effect on the write.

The  $\overline{WP}$  pin function is blocked when the WPEN bit in the Status register is low. This allows the user to install the 25XX080 in a system with WP pin grounded and still be able to write to the Status register. The WP pin functions will be enabled when the WPEN bit is set high.

### 2.4 Serial Input (SI)

The SI pin is used to transfer data into the device. It receives instructions, addresses and data. Data is latched on the rising edge of the serial clock.

### 2.5 Serial Clock (SCK)

The SCK is used to synchronize the communication between a master and the 25XX080. Instructions, addresses or data present on the SI pin are latched on the rising edge of the clock input, while data on the SO pin is updated after the falling edge of the clock input.

### 2.6 Hold ( $\overline{HOLD}$ )

The  $\overline{HOLD}$  pin is used to suspend transmission to the 25XX080 while in the middle of a serial sequence without having to retransmit the entire sequence again. It must be held high any time this function is not being used. Once the device is selected and a serial sequence is underway, the  $\overline{HOLD}$  pin may be pulled low to pause further serial communication without resetting the serial sequence. The  $\overline{HOLD}$  pin must be brought low while SCK is low, otherwise the HOLD function will not be invoked until the next SCK high-to-low transition. The 25XX080 must remain selected during this sequence. The SI, SCK and SO pins are in a high-impedance state during the time the device is paused and transitions on these pins will be ignored. To resume serial communication, HOLD must be brought high while the SCK pin is low, otherwise serial communication will not resume. Lowering the HOLD line at any time will tri-state the SO line.

# 25AA080/25LC080/25C080

---

## 3.0 FUNCTIONAL DESCRIPTION

### 3.1 Principles of Operation

The 25XX080 are 1024 byte Serial EEPROMs designed to interface directly with the Serial Peripheral Interface (SPI) port of many of today's popular microcontroller families, including Microchip's PIC16C6X/7X microcontrollers. It may also interface with microcontrollers that do not have a built-in SPI port by using discrete I/O lines programmed properly with the software.

The 25XX080 contains an 8-bit instruction register. The device is accessed via the SI pin, with data being clocked in on the rising edge of SCK. The CS pin must be low and the HOLD pin must be high for the entire operation. The WP pin must be held high to allow writing to the memory array.

Table 3-1 contains a list of the possible instruction bytes and format for device operation. All instructions, addresses, and data are transferred MSB first, LSB last.

Data is sampled on the first rising edge of SCK after CS goes low. If the clock line is shared with other peripheral devices on the SPI bus, the user can assert the HOLD input and place the 25XX080 in 'HOLD' mode. After releasing the HOLD pin, operation will resume from the point when the HOLD was asserted.

### 3.2 Read Sequence

The device is selected by pulling CS low. The 8-bit READ instruction is transmitted to the 25XX080 followed by the 16-bit address, with the six MSBs of the address being "don't care" bits. After the correct READ instruction and address are sent, the data stored in the memory at the selected address is shifted out on the SO pin. The data stored in the memory at the next address can be read sequentially by continuing to provide clock pulses. The internal address pointer is automatically incremented to the next higher address after each byte of data is shifted out. When the highest address is reached (03FFh), the address counter rolls over to address 0000h allowing the read cycle to be continued indefinitely. The read operation is terminated by raising the CS pin (Figure 3-1).

TABLE 3-1: INSTRUCTION SET

Instruction Name	Instruction Format	Description
READ	0000 0011	Read data from memory array beginning at selected address
WRITE	0000 0010	Write data to memory array beginning at selected address
WRDI	0000 0100	Reset the write enable latch (disable write operations)
WREN	0000 0110	Set the write enable latch (enable write operations)
RDSR	0000 0101	Read Status register
WRSR	0000 0001	Write Status register

### 3.3 Write Sequence

Prior to any attempt to write data to the 25XX080, the write enable latch must be set by issuing the WREN instruction (Figure 3-4). This is done by setting CS low and then clocking out the proper instruction into the 25XX080. After all eight bits of the instruction are transmitted, the CS must be brought high to set the write enable latch. If the write operation is initiated immediately after the WREN instruction without CS being brought high, the data will not be written to the array because the write enable latch will not have been properly set.

Once the write enable latch is set, the user may proceed by setting the CS low, issuing a WRITE instruction, followed by the 16-bit address, with the six MSBs of the address being "don't care" bits, and then the data to be written. Up to 16 bytes of data can be sent to the 25XX080 before a write cycle is necessary. The only restriction is that all of the bytes must reside in the same page. A page address begins with xxxx xxxx xxxx 0000 and ends with xxxx xxxx xxxx 1111. If the internal address counter reaches xxxx xxxx xxxx 1111 and the clock continues, the counter will roll back to the first address of the page and overwrite any data in the page that may have been written.

For the data to be actually written to the array, the CS must be brought high after the Least Significant bit (D0) of the  $n^{th}$  data byte has been clocked in. If CS is brought high at any other time, the write operation will not be completed. Refer to Figure 3-2 and Figure 3-3 for more detailed illustrations on the byte write sequence and the page write sequence respectively. While the write is in progress, the Status register may be read to check the status of the WPEN, WIP, WEL, BP1 and BP0 bits (Figure 3-6). A read attempt of a memory array location will not be possible during a write cycle. When the write cycle is completed, the write enable latch is reset.

**FIGURE 3-1: READ SEQUENCE**

**FIGURE 3-2: BYTE WRITE SEQUENCE**

**FIGURE 3-3: PAGE WRITE SEQUENCE**

# 25AA080/25LC080/25C080

## 3.4 Write Enable (WREN) and Write Disable (WRDI)

The 25XX080 contains a write enable latch. See Table 3-3 for the Write-Protect Functionality Matrix. This latch must be set before any write operation will be completed internally. The WREN instruction will set the latch, and the WRDI will reset the latch.

The following is a list of conditions under which the write enable latch will be reset:

- Power-up
- WRDI instruction successfully executed
- WRSR instruction successfully executed
- WRITE instruction successfully executed

**FIGURE 3-4: WRITE ENABLE SEQUENCE**

**FIGURE 3-5: WRITE DISABLE SEQUENCE**

# 25AA080/25LC080/25C080

## 3.5 Read Status Register (RDSR)

The Read Status Register (RDSR) instruction provides access to the Status register. The Status register may be read at any time, even during a write cycle. The Status register is formatted as follows:

7	6	5	4	3	2	1	0
WPEN	X	X	X	BP1	BP0	WEL	WIP

The **Write-In-Process (WIP)** bit indicates whether the 25XX080 is busy with a write operation. When set to a '1', a write is in progress, when set to a '0', no write is in progress. This bit is read-only.

The **Write Enable Latch (WEL)** bit indicates the status of the write enable latch. When set to a '1', the latch allows writes to the array, when set to a '0', the latch prohibits writes to the array. The state of this bit can always be updated via the WREN or WRDI commands regardless of the state of write protection on the Status register. This bit is read only.

The **Block Protection (BP0 and BP1)** bits indicate which blocks are currently write-protected. These bits are set by the user issuing the WRSR instruction. These bits are nonvolatile.

See Figure 3-6 for the RDSR timing sequence.

**FIGURE 3-6: READ STATUS REGISTER TIMING SEQUENCE**

# 25AA080/25LC080/25C080

## 3.6 Write Status Register (WRSR)

The Write Status Register (WRSR) instruction allows the user to select one of four levels of protection for the array by writing to the appropriate bits in the Status register. The array is divided up into four segments. The user has the ability to write-protect none, one, two, or all four of the segments of the array. The partitioning is controlled as shown in Table 3-2.

The Write-Protect Enable (WPEN) bit is a nonvolatile bit that is available as an enable bit for the WP pin. The Write-Protect (WP) pin and the Write-Protect Enable (WPEN) bit in the Status register control the programmable hardware write-protect feature. Hardware write protection is enabled when WP pin is low and the WPEN bit is high. Hardware write protection is disabled when either the WP pin is high or the WPEN bit is low. When the chip is hardware write-protected, only writes to nonvolatile bits in the Status register are disabled. See Table 3-3 for a matrix of functionality on the WPEN bit.

See Figure 3-5 for the WRSR timing sequence.

TABLE 3-2: ARRAY PROTECTION

BP1	BP0	Array Addresses Write-Protected
0	0	none
0	1	upper 1/4 (0300h - 03FFh)
1	0	upper 1/2 (0200h - 03FFh)
1	1	all (0000h - 03FFh)

FIGURE 3-7: WRITE STATUS REGISTER TIMING SEQUENCE

# 25AA080/25LC080/25C080

---

## 3.7 Data Protection

The following protection has been implemented to prevent inadvertent writes to the array:

- The write enable latch is reset on power-up
- A `WRITE_ENABLE` instruction must be issued to set the write enable latch
- After a byte write, page write or Status register write, the write enable latch is reset
- $\overline{CS}$  must be set high after the proper number of clock cycles to start an internal write cycle
- Access to the array during an internal write cycle is ignored and programming is continued

## 3.8 Power-On State

The 25XX080 powers on in the following state:

- The device is in low-power Standby mode ( $\overline{CS} = 1$ )
- The write enable latch is reset
- SO is in high-impedance state
- A high-to-low level transition on  $\overline{CS}$  is required to enter active state

**TABLE 3-3: WRITE-PROTECT FUNCTIONALITY MATRIX**

WPEN	$\overline{WP}$	WEL	Protected Blocks	Unprotected Blocks	Status Register
X	X	0	Protected	Protected	Protected
0	X	1	Protected	Writable	Writable
1	Low	1	Protected	Writable	Protected
X	High	1	Protected	Writable	Writable

## 4.0 PACKAGING INFORMATION

### 4.1 Package Marking Information

8-Lead PDIP (300 mil)

Example:

8-Lead SOIC (150 mil)

Example:

**Legend:** XX...X Customer specific information\*

Y Year code (last digit of calendar year)

YY Year code (last 2 digits of calendar year)

WW Week code (week of January 1 is week '01')

NNN Alphanumeric traceability code

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.

- \* Standard PICmicro device marking consists of Microchip part number, year code, week code, and traceability code. For PICmicro device marking beyond this, certain price adders apply. Please check with your Microchip Sales Office. For QTP devices, any special marking adders are included in QTP price.

## ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape® or Microsoft® Internet Explorer. Files are also available for FTP download from our FTP site.

### Connecting to the Microchip Internet Web Site

The Microchip web site is available at the following URL:

**[www.microchip.com](http://www.microchip.com)**

The file transfer site is available by using an FTP service to connect to:

**<ftp://ftp.microchip.com>**

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

## SYSTEMS INFORMATION AND UPGRADE HOT LINE

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive the most current upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and

1-480-792-7302 for the rest of the world.

042003

## READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

## Questions:

## 1. What are the best features of this document?

2. How does this document meet your hardware and software development needs?

---

Digitized by srujanika@gmail.com

3. Do you find the organization of this document easy to follow? If not, why?

---

Page 10 of 10

4. What additions to the document do you think would enhance the structure and subject?

5. What deletions from the document could be made without affecting the overall usefulness?

---

Page 10 of 10

6. Is there any incorrect or misleading information (what and where)?

---

Page 10 of 10

7. How would you improve this document?

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>	X	/XX	XXX	
Device	Temperature Range	Package	Pattern	
Device	25AA080: 8 Kbit 1.8V SPI Serial EEPROM 25AA080T: 8 Kbit 1.8V SPI Serial EEPROM (Tape and Reel) 25LC080: 8 Kbit 2.5V SPI Serial EEPROM 25LC080: 8 Kbit 2.5V SPI Serial EEPROM (Tape and Reel) 25C080: 8 Kbit 5.0V SPI Serial EEPROM 25C080: 8 Kbit 5.0V SPI Serial EEPROM (Tape and Reel)			
Temperature Range	I = -40°C to +85°C E = -40°C to +125°C			
Package	P = Plastic DIP (300 mil body), 8-lead SN = Plastic SOIC (150 mil body), 8-lead			

**Examples:**

- a) 25AA080-I/SN: Industrial Temp., SOIC package
- b) 25AA080T-I/SN: Tape and Reel, Industrial Temp., SOIC package
- c) 25LC080-I/SN: Industrial Temp., SOIC package
- d) 25LC080T-I/SN: Tape and Reel, Industrial Temp., SOIC package
- e) 25C080-I/P: Industrial Temp., PDIP package
- f) 25C080-I/SN: Industrial Temp., SOIC package
- g) 25C080T-I/SN: Tape and Reel, Industrial Temp., SOIC package
- h) 25C080-E/SN: Extended Temp., SOIC package

## Sales and Support

### Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site ([www.microchip.com](http://www.microchip.com))

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### New Customer Notification System

Register on our web site ([www.microchip.com/cn](http://www.microchip.com/cn)) to receive the most current information on our products.

---

---

**NOTES:**

---

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM  
CERTIFIED BY DNV  
=ISO/TS 16949:2002=**

*Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMS, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
