

## 7548 Group

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

REJ03B0210-0201

Rev.2.01

Oct 15, 2007

### DESCRIPTION

The 7548 Group is the 8-bit microcomputer based on the 740 family core technology.

The 7548 Group has an 8-bit timer, 16-bit timer, serial interface, A/D converter, power-on reset circuit and the low voltage detection circuit. Also, the Function set ROM is equipped.

### FEATURES

- Basic machine-language instructions ..... 71
- The minimum instruction execution time ..... 0.25  $\mu$ s  
(at 8 MHz oscillation frequency, double-speed mode)
- Memory size
  - ROM ..... 2K, 4K, 6K bytes
  - RAM ..... 192/256 bytes
- Programmable I/O ports
  - I/O port..... 15
  - Output port..... 1
- Key-on wakeup ..... 6
- LED direct drive port ..... 8
- Interrupts ..... 12 sources, 12 vectors
- Timers ..... 8-bit  $\times$  2  
..... 16-bit  $\times$  1
- Output compare ..... 3 channel
- Input capture ..... 1 channel

- Serial interface..... 8-bit  $\times$  1  
(UART or clock synchronous)
- A/D converter ..... 10-bit resolution  $\times$  6-channel
- Clock generating circuit ..... Built-in type  
(connect to external ceramic resonator or quartz-crystal oscillator,  
32 kHz quartz-crystal oscillation available)
- High-speed on-chip oscillator ..... Typ. : 4 MHz
- Low-speed on-chip oscillator ..... Typ. : 250 kHz
- Watchdog timer ..... 16-bit  $\times$  1
- Power-on reset circuit..... Built-in type
- Low voltage detection circuit ..... Built-in type
- Power source voltage
  - XIN oscillation frequency  
(at ceramic resonator, in double-speed mode)
    - At 8 MHz ..... 4.5 to 5.5 V
    - At 2 MHz ..... 2.4 to 5.5 V
    - At 1 MHz ..... 2.2 to 5.5 V
  - XIN oscillation frequency  
(at ceramic resonator, in high-speed mode)
    - At 8 MHz ..... 4.0 to 5.5 V
    - At 4 MHz ..... 2.4 to 5.5 V
    - At 1 MHz ..... 1.8 to 5.5 V
  - High-speed on-chip oscillator oscillation frequency
    - At 4 MHz..... 4.0 to 5.5 V
  - Low-speed on-chip oscillator oscillation frequency
    - At 250 kHz (typ. value at VCC = 5 V) ... 1.8 to 5.5 V
- Power dissipation ..... 30 mW
- Operating temperature range ..... -20 to 85°C

### APPLICATION

Office automation equipment, factory automation equipment, home electric appliances, consumer electronics, etc.

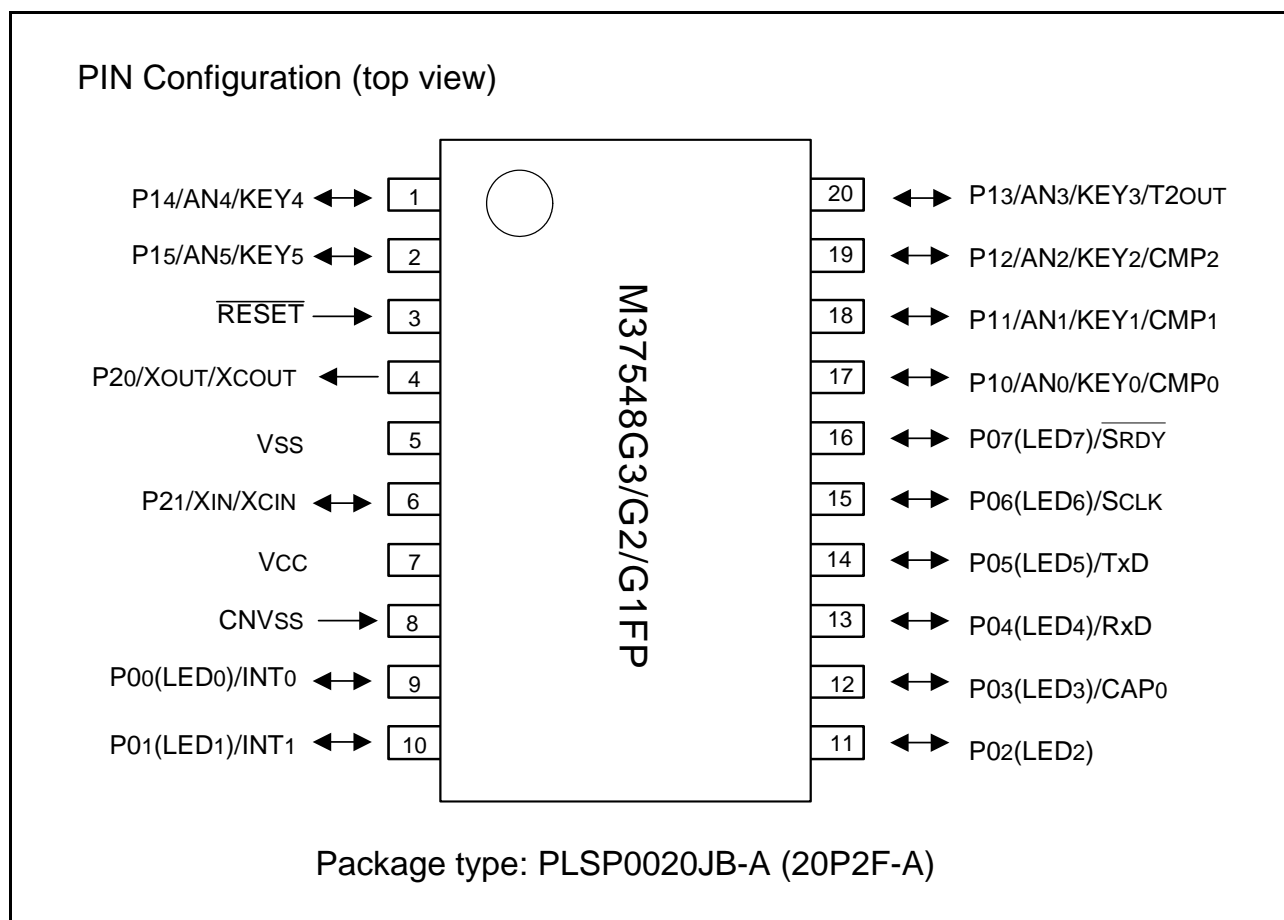

Fig 1. Pin configuration (PLSP0020JB-A type)

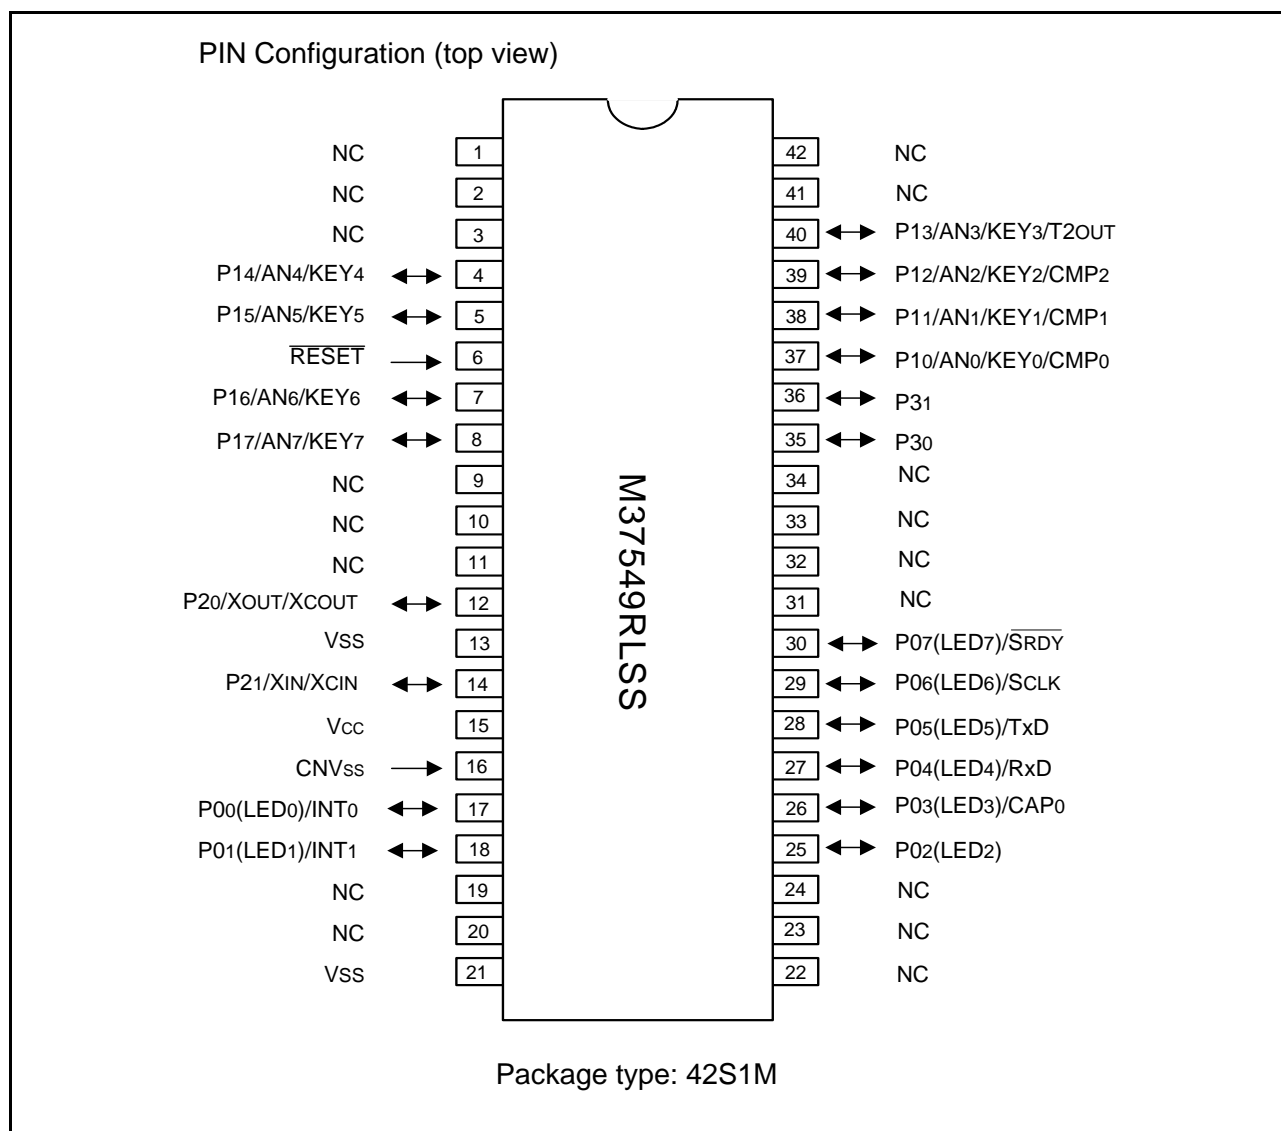

Fig 2. Pin configuration (42S1M type)

## PERFORMANCE OVERVIEW

Table 1 Performance overview

Parameter			Function
Number of basic instructions			71
Instruction execution time			0.25 μs (Minimum instruction, oscillation frequency 8 MHz, double-speed mode)
Oscillation frequency			8 MHz (Maximum)
Memory sizes	ROM	M37548G1	2K bytes × 8 bits
		M37548G2	4K bytes × 8 bits
		M37548G3	6K bytes × 8 bits
	RAM	M37548G1	192 bytes × 8 bits
		M37548G2	256 bytes × 8 bits
		M37548G3	256 bytes × 8 bits
I/O port	P0 <sub>0</sub> -P0 <sub>7</sub>	I/O	1-bit × 8, LED direct drive ports
	P1 <sub>0</sub> -P1 <sub>5</sub>	I/O	1-bit × 6
	P2 <sub>0</sub>	Output	1-bit × 1
	P2 <sub>1</sub>	I/O	1-bit × 1
Interrupts	Source		12 sources, 12 vectors
Timer			8-bit × 2, 16-bit × 1
Output compare			3-channel
Input capture			1 channel
Serial interface			8-bit × 1 (UART or clock synchronous)
A/D converter			10-bit resolution × 6 channel
Watchdog timer			16-bit × 1
Power-on reset circuit			Built-in
Low voltage detection circuit			Built-in
Clock generating circuit			Built-in (external ceramic resonator or quartz-crystal oscillator, external 32-kHz quartz-crystal oscillator available) (built-in high/low-speed on-chip oscillator)
Function set ROM area	Function set ROM		Function set ROM is assigned to address FFDB <sub>16</sub> to FFDA <sub>16</sub> . Valid/invalid of low voltage detection circuit can be selected. Oscillation mode can be selected. Enable/disable of watchdog timer and STP instruction can be selected.
	ROM code protect		ROM code protect is assigned to address FFDB <sub>16</sub> . Read/write the built-in QzROM by serial programmer is disabled by setting “00” to ROM code protect.
Power source voltage (at ceramic resonator)	Double-speed mode	at 8 MHz oscillation	4.5 to 5.5 V
		at 2 MHz oscillation	2.4 to 5.5 V
		at 1 MHz oscillation	2.2 to 5.5 V
	High-speed mode	at 8 MHz oscillation	4.0 to 5.5 V
		at 4 MHz oscillation	2.4 to 5.5 V
		at 1 MHz oscillation	1.8 to 5.5 V
Power source voltage (at high-speed on-chip oscillator)	Double-speed mode	at 4 MHz oscillation	4.0 to 5.5 V
Power source voltage (at low-speed on-chip oscillator)	Double-speed mode	at 250 kHz oscillation	1.8 to 5.5 V
Power dissipation			30 mW
Operating temperature range			-20 to 85 °C
Device structure			CMOS silicon gate
Package			20-pin plastic molded SSOP (PLSP0020JB-A)

Fig 3. FUNCTIONAL BLOCK DIAGRAM

## PIN DESCRIPTION

Table 2 Pin description

Pin	Name	Function		
		Function except a port function		
Vcc,Vss	Power source	Apply voltage of 1.8 to 5.5 V to Vcc, and 0 V to Vss.		
CNVss	CNVss	Controls the operation mode of the chip. Connected to Vss.		
RESET	Reset input	Reset input pin for active "L"		
P0 <sub>0</sub> (LED0)/INT <sub>0</sub> P0 <sub>1</sub> (LED1)/INT <sub>1</sub>	I/O port P0	<ul style="list-style-type: none"> <li>•8-bit I/O port.</li> <li>•I/O direction register allows each pin to be individually programmed as either input or output.</li> <li>•CMOS compatible input level</li> <li>•CMOS 3-state output structure</li> <li>•Whether a built-in pull-up resistor is to be used or not can be determined by program.</li> <li>•High drive capacity for LED drive port can be selected by program.</li> </ul>	Interrupt input pin	
P0 <sub>2</sub> (LED2)				
P0 <sub>3</sub> (LED3)/CAP <sub>0</sub>			Capture input pin	
P0 <sub>4</sub> (LED4)/RxD P0 <sub>5</sub> (LED5)/TxD P0 <sub>6</sub> (LED6)/SCLK P0 <sub>7</sub> (LED7)/SRDY			Serial interface function pin	
P1 <sub>0</sub> /AN <sub>0</sub> /KEY <sub>0</sub> /CMP <sub>0</sub> P1 <sub>1</sub> /AN <sub>1</sub> /KEY <sub>1</sub> /CMP <sub>1</sub> P1 <sub>2</sub> /AN <sub>2</sub> /KEY <sub>2</sub> /CMP <sub>2</sub>	I/O port P1	<ul style="list-style-type: none"> <li>•6-bit I/O port.</li> <li>•I/O direction register allows each pin to be individually programmed as either input or output.</li> <li>•CMOS compatible input level</li> <li>•CMOS 3-state output structure</li> <li>•Whether a built-in pull-up resistor is to be used or not can be determined by program.</li> </ul>	Input pins for A/D converter	Key-input (key-on wake up interrupt input) pin
P1 <sub>3</sub> /AN <sub>3</sub> /KEY <sub>3</sub> /T2OUT				Compare output pin Timer 2 output pin
P1 <sub>4</sub> /AN <sub>4</sub> /KEY <sub>4</sub> P1 <sub>5</sub> /AN <sub>5</sub> /KEY <sub>5</sub>				
P2 <sub>0</sub> /XOUT/XCOUT P2 <sub>1</sub> /XIN/XCIN (Note)	I/O port P2	<ul style="list-style-type: none"> <li>•2-bit I/O port. (P2<sub>0</sub>/XOUT/XCOUT is only for output)</li> <li>•I/O direction register allows each pin to be individually programmed as either input or output.</li> <li>•CMOS compatible input level</li> <li>•CMOS 3-state output structure</li> <li>•Function set ROM allows pins to be used as clock pins.</li> </ul>	Pins XIN and XOUT, or pins XCIN and XCOUT, can be used as clock pins by connecting a ceramic resonator, crystal oscillator, or 32 kHz crystal oscillator between them. Alternately, an external clock may be input to the P2 <sub>0</sub> /XOUT/XCOUT pin. In this case, the P2 <sub>1</sub> /XIN/XCIN pin can be used as an I/O port.	

## NOTE:

1. The oscillation circuit is built in the P2<sub>0</sub>/XOUT/XCOUT pin and the P2<sub>1</sub>/XIN/XCIN pin. When the Vcc of the microcomputer is lower than the operation lower bound voltage even if these pins are used as I/O ports, the oscillation circuit is connected and undefined values may be output from these pins.

## 7548 Group

### GROUP EXPANSION

Renesas plans to expand the 7548 group as follow:

#### Memory Type

Support for QzROM version and emulator MCU.

#### Memory Size

- ROM size ..... 2K to 6K bytes
- RAM size ..... 192 to 256 bytes

#### Packages

- PLSP0020JB-A .... 0.65 mm-pitch 20-pin plastic molded SSOP
- 42S1M ..... 42-pin shrink ceramic PIGGY BACK

**Fig 4. Memory expansion plan**

Currently supported products are listed below.

**Table 3 List of supported products**

As of Sep. 2007

Part number	ROM size (bytes) ROM size for User ( )	RAM size (bytes)	Package	Remarks
M37548G3-XXXFP	6144 (6014)	256	PLSP0020JB-A	QzROM version
M37548G3FP				QzROM version (blank)
M37548G2-XXXFP	4096 (3966)	256	PLSP0020JB-A	QzROM version
M37548G2FP				QzROM version (blank)
M37548G1-XXXFP	2048 (1918)	192	PLSP0020JB-A	QzROM version
M37548G1FP				QzROM version (blank)
M37549RLSS	—	256	42S1M	Emulator MCU

NOTE:

1. ROM size includes the function set ROM.

## 1. FUNCTIONAL DESCRIPTION

### Central Processing Unit (CPU)

The MCU uses the standard 740 family instruction set. Refer to the table of 740 family addressing modes and machine-language instructions or the SERIES 740 <SOFTWARE> USER'S MANUAL for details on each instruction set.

Machine-resident 740 family instructions are as follows:

1. The FST and SLW instructions cannot be used.
2. The MUL and DIV instructions can be used.
3. The WIT instruction can be used.
4. The STP instruction can be used.

### [Accumulator (A)]

The accumulator is an 8-bit register. Data operations such as data transfer, etc., are executed mainly through the accumulator.

### [Index register X (X), Index register Y (Y)]

Both index register X and index register Y are 8-bit registers. In the index addressing modes, the value of the OPERAND is added to the contents of register X or register Y and specifies the real address.

When the T flag in the processor status register is set to "1", the value contained in index register X becomes the address for the second OPERAND.

### [Stack Pointer (S)]

The stack pointer is an 8-bit register used during subroutine calls and interrupts. The stack is used to store the current address data and processor status when branching to subroutines or interrupt routines.

The lower eight bits of the stack address are determined by the contents of the stack pointer. The upper eight bits of the stack address are determined by the Stack Page Selection Bit. If the Stack Page Selection Bit is "0", then the RAM in the zero page is used as the stack area. If the Stack Page Selection Bit is "1", then RAM in page 1 is used as the stack area.

The Stack Page Selection Bit is located in the SFR area in the zero page. Note that the initial value of the Stack Page Selection Bit varies with each microcomputer type. Also some microcomputer types have no Stack Page Selection Bit and the upper eight bits of the stack address are fixed. The operations of pushing register contents onto the stack and popping them from the stack are shown in Figure 6.

### [Program Counter (PC)]

The program counter is a 16-bit counter consisting of two 8-bit registers PCH and PCL. It is used to indicate the address of the next instruction to be executed.

Fig 5. 740 Family CPU register structure

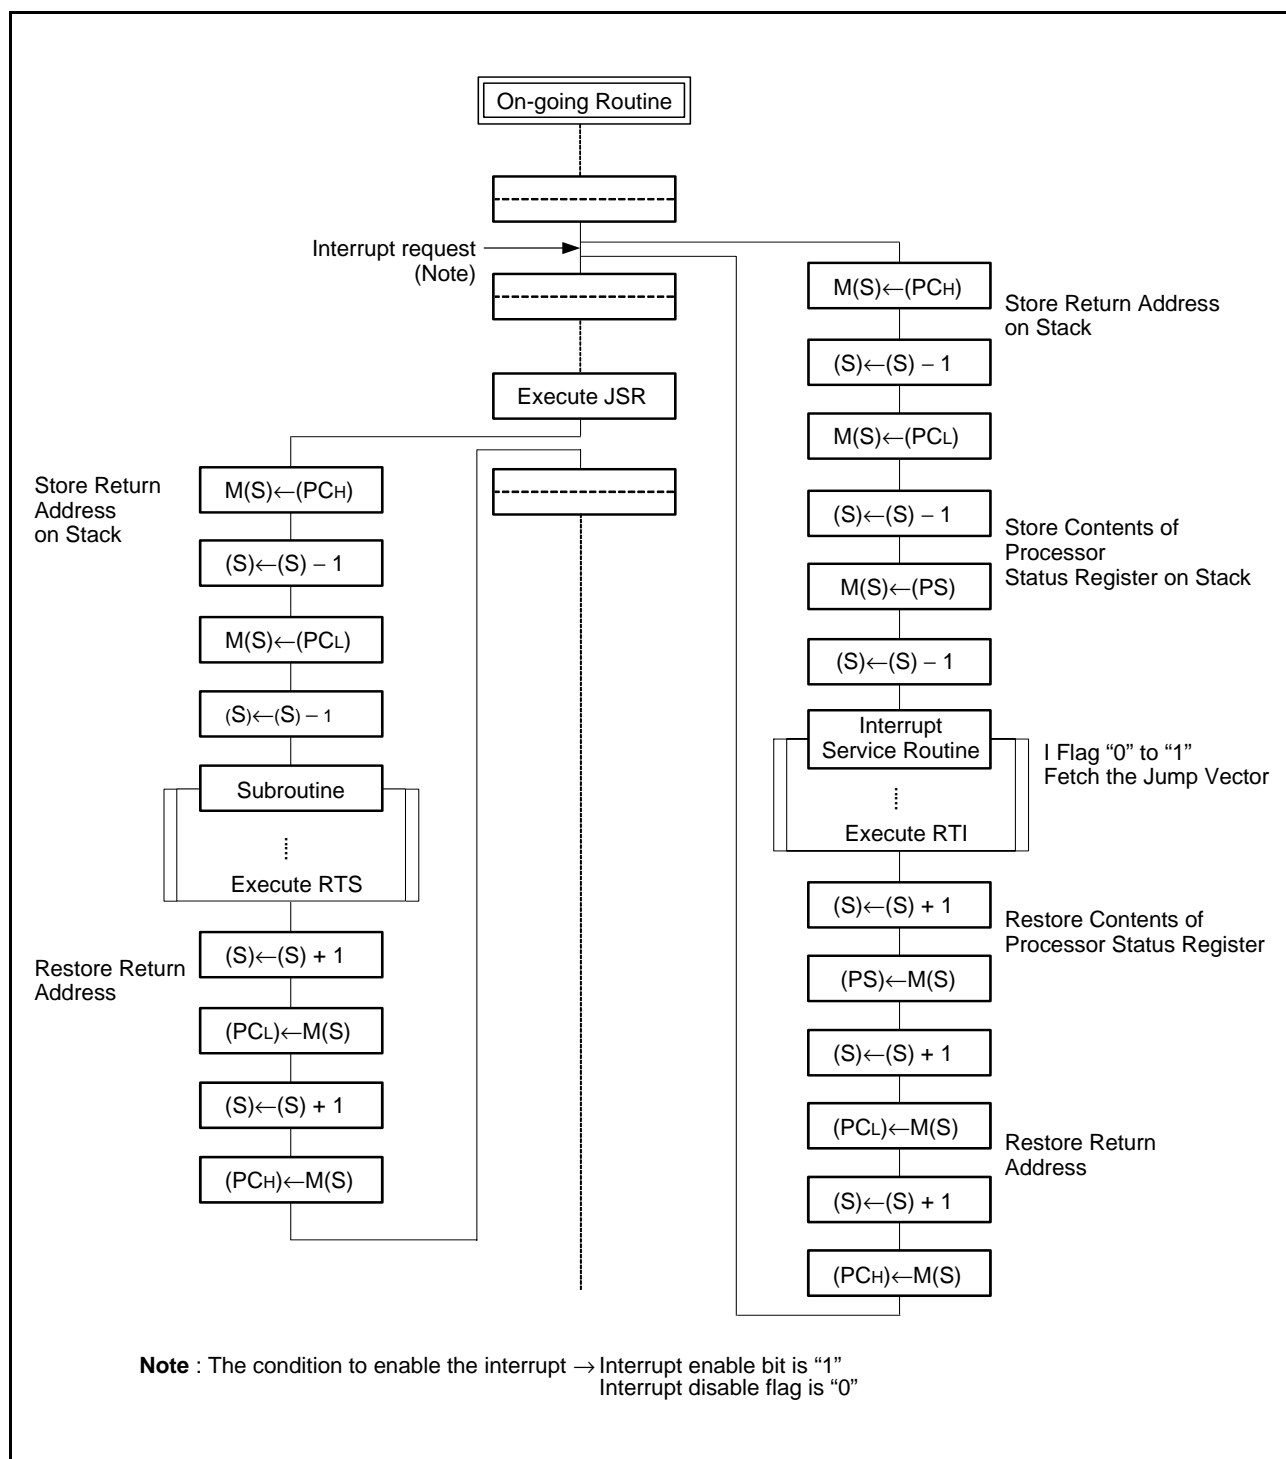

Fig 6. Register push and pop at interrupt generation and subroutine call

Table 4 Push and pop instructions of accumulator or processor status register

	Push instruction to stack	Pop instruction from stack
Accumulator	PHA	PLA
Processor status register	PHP	PLP

**[Processor status register (PS)]**

The processor status register is an 8-bit register consisting of flags which indicate the status of the processor after an arithmetic operation. Branch operations can be performed by testing the Carry (C) flag, Zero (Z) flag, Overflow (V) flag, or the Negative (N) flag. In decimal mode, the Z, V, N flags are not valid.

After reset, the Interrupt disable (I) flag is set to "1", but all other flags are undefined. Since the Index X mode (T) and Decimal mode (D) flags directly affect arithmetic operations, they should be initialized in the beginning of a program.

**Bit 0: Carry flag (C)**

The C flag contains a carry or borrow generated by the arithmetic logic unit (ALU) immediately after an arithmetic operation. It can also be changed by a shift or rotate instruction.

**Bit 1: Zero flag (Z)**

The Z flag is set if the result of an immediate arithmetic operation or a data transfer is "0", and cleared if the result is anything other than "0".

**Bit 2: Interrupt disable flag (I)**

The I flag disables all interrupts except for the interrupt generated by the BRK instruction. Interrupts are disabled when the I flag is "1".

When an interrupt occurs, this flag is automatically set to "1" to prevent other interrupts from interfering until the current interrupt is serviced.

**Bit 3: Decimal mode flag (D)**

The D flag determines whether additions and subtractions are executed in binary or decimal. Binary arithmetic is executed when this flag is "0"; decimal arithmetic is executed when it is "1".

Decimal correction is automatic in decimal mode. Only the ADC and SBC instructions can be used for decimal arithmetic.

**Bit 4: Break flag (B)**

The B flag is used to indicate that the current interrupt was generated by the BRK instruction. The BRK flag in the processor status register is always "0". When the BRK instruction is used to generate an interrupt, the processor status register is pushed onto the stack with the break flag set to "1". The saved processor status is the only place where the break flag is ever set.

**Bit 5: Index X mode flag (T)**

When the T flag is "0", arithmetic operations are performed between accumulator and memory, e.g. the results of an operation between two memory locations is stored in the accumulator. When the T flag is "1", direct arithmetic operations and direct data transfers are enabled between memory locations, i.e. between memory and memory, memory and I/O, and I/O and I/O. In this case, the result of an arithmetic operation performed on data in memory location 1 and memory location 2 is stored in memory location 1. The address of memory location 1 is specified by index register X, and the address of memory location 2 is specified by normal addressing modes.

**Bit 6: Overflow flag (V)**

The V flag is used during the addition or subtraction of one byte of signed data. It is set if the result exceeds +127 to -128. When the BIT instruction is executed, bit 6 of the memory location operated on by the BIT instruction is stored in the overflow flag.

**Bit 7: Negative flag (N)**

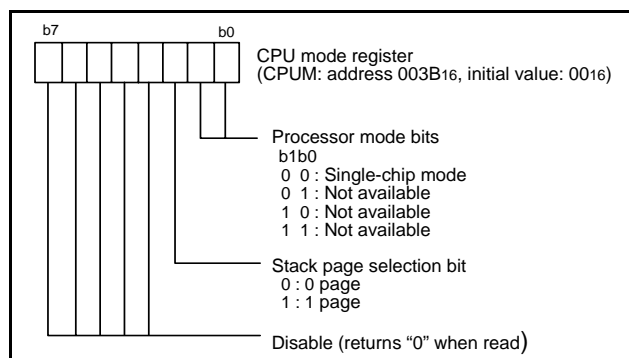

The N flag is set if the result of an arithmetic operation or data transfer is negative. When the BIT instruction is executed, bit 7 of the memory location operated on by the BIT instruction is stored in the negative flag.

**Table 5 Set and clear instructions of each bit of processor status register**

	C flag	Z flag	I flag	D flag	B flag	T flag	V flag	N flag
Set instruction	SEC	–	SEI	SED	–	SET	–	–
Clear instruction	CLC	–	CLI	CLD	–	CLT	CLV	–

**[CPU mode register] CPUM**

The CPU mode register contains the stack page selection bit. This register is allocated at address 003B<sub>16</sub>.

**Fig 7. Structure of CPU mode register**

The processor mode bits can be written only once after releasing reset. Always set them to "002". After written, rewriting any data to these bits is disabled because they are locked. (Emulator MCU is excluded.) Also, the stack page selection bit (bit 2) is not locked.

In order to prevent error-writing to the processor mode bits (at program runaway), write the CPU mode register at the start of the program that runs after releasing reset.

## Memory

### • Special Function Register (SFR) Area

The SFR area in the zero page contains control registers such as I/O ports and timers.

### • RAM

RAM is used for data storage and for a stack area of subroutine calls and interrupts.

### • ROM

The first 128 bytes and the last 2 bytes of ROM are reserved for device testing and the rest is a user area for storing programs. The user area includes the function set ROM area.

### • Interrupt Vector Area

The interrupt vector area contains reset and interrupt vectors.

### • Zero Page

The 256 bytes from addresses 0000<sub>16</sub> to 00FF<sub>16</sub> are called the zero page area. The internal RAM and the special function registers (SFR) are allocated to this area.

The zero page addressing mode can be used to specify memory and register addresses in the zero page area. Access to this area with only 2 bytes is possible in the zero page addressing mode.

### • Special Page

The 256 bytes from addresses FF00<sub>16</sub> to FFFF<sub>16</sub> are called the special page area. The special page addressing mode can be used to specify memory addresses in the special page area. Access to this area with only 2 bytes is possible in the special page addressing mode.

### • Function set ROM Area

#### [Renesas shipment test area]

Figure 8 shows the Assignment of Function set ROM area.

The random data are set to the Renesas shipment test areas (addresses FFD4<sub>16</sub> to address FFD7<sub>16</sub>).

Do not rewrite the data of these areas.

When the checksum is included in the user program, avoid assigning it to these areas.

#### [Function set ROM data] FSR0M0, FSR0M1, FSR0M2

Function set ROM data 0 to 2 (addresses FFD8<sub>16</sub> to FFDA<sub>16</sub>) are used to set modes of peripheral functions.

By setting values to these areas, the operation mode of each peripheral function are set after releasing reset.

Refer to the descriptions of peripheral functions for the details of operation of peripheral functions.

- Clock generating circuit (page 46)
- Watchdog timer (page 42)
- Low voltage detection circuit (page 44)

### [ROM code protect]

Address FFDB<sub>16</sub> of QzROM version is ROM code protect address and cannot be used for programming. "00<sub>16</sub>" is written into this address when selecting the protect bit write by using a serial programmer and selecting protect enabled for writing shipment by Renesas Technology corp.. When "00<sub>16</sub>" is set to the ROM code protect address, the protect function is enabled, so that reading or writing from/to the corresponding area is disabled by a serial programmer.

As for the QzROM product in blank, the ROM code is protected by selecting the protect bit write at ROM writing with a serial programmer. As for the QzROM product shipped after writing, "00<sub>16</sub>" (protect enabled) or "FF<sub>16</sub>" (protect disabled) is written into the ROM code protect address when Renesas Technology corp. performs writing. The writing of "00<sub>16</sub>" or "FF<sub>16</sub>" can be selected as ROM option setup ("MASK option" written in the mask file converter) when ordering.

### <Notes>

- (1) Because the contents of RAM are indefinite at reset, set initial values before using.
- (2) Do not access to the reserved area.
- (3) Random data is written into the Renesas shipment test area and the reserved ROM area. Do not rewrite the data in these areas. Data of these area may be changed without notice. Accordingly, do not include these areas into programs such as checksum of all ROM areas.
- (4) The QzROM values in function set ROM data 0 to 2 set the operating modes of the various peripheral functions after an MCU reset is released. Do not fail to set the value for the selected function. Bits designated with a fixed value of 1 or 0 must be set to the designated value.

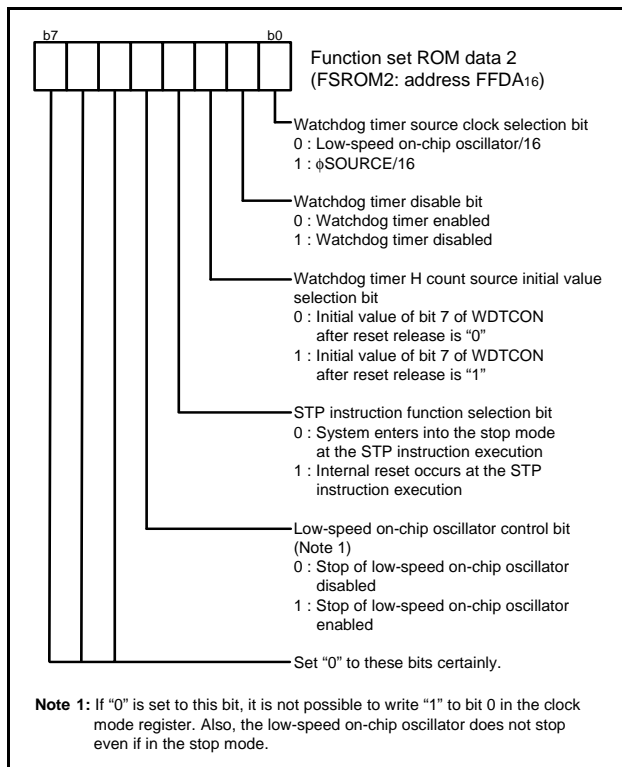

Fig 12. Structure of Function set ROM data 2

## I/O Ports

### [Direction registers] PiD

The I/O ports have direction registers which determine the input/output direction of each pin. Each bit in a direction register corresponds to one pin, and each pin can be set to be input or output.

When “1” is set to the bit corresponding to a pin, this pin becomes an output port. When “0” is set to the bit, the pin becomes an input port.

When data is read from a pin set to output, not the value of the pin itself but the value of port latch is read. Pins set to input are floating, and permit reading pin values.

If a pin set to input is written to, only the port latch is written to and the pin remains floating.

- If the port P20 is used as output port, write “1” to the port P20 direction register after reset.
- Set “1” to bits 6 and 7 of the port P1 direction register.
- Set “1” to bits 0 and 1 of the port P3 direction register.

### [Port P0 drive capacity control register] DCCR

By setting the Port P0 drive capacity control register (address 000C16), the drive capacity of the N-channel output transistor for the port P0 can be selected.

### [Pull-up control registers] PULL0, PULL1

By setting the pull-up control registers (address 000D16 and 000E16), ports P0 and P1 can exert pull-up control by program. However, this is valid only when the port direction registers are set to input.

When they are set to output, setting “pull-up on” does not pull up the ports.

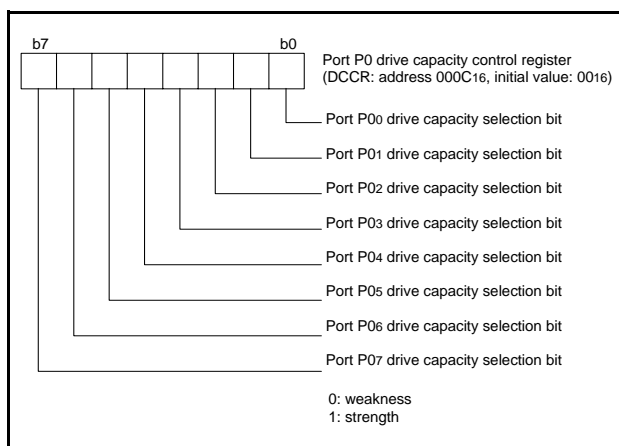

Fig 13. Structure of port P0 drive capacity control register

### Termination of unused pins

- Termination of common pins

I/O ports: Select an input port or an output port and follow each processing method.

Output ports: Open.

Input ports: If the input level become unstable, through current flow to an input circuit, and the power supply current may increase.

Especially, when expecting low consumption current (at STP or WIT instruction execution etc.), pull-up or pull-down input ports to prevent through current (built-in resistor can be used).

We recommend processing unused pins through a resistor which can secure IOH (avg) or IOL (avg). Because, when an I/O port or a pin which have an output function is selected as an input port, it may operate as an output port by incorrect operation etc.

**Table 7 Termination of unused pins**

Pin	Termination
P0 <sub>0</sub> /INT <sub>0</sub>	Perform termination of I/O port.
P0 <sub>1</sub> /INT <sub>1</sub>	
P0 <sub>2</sub>	
P0 <sub>3</sub>	
P0 <sub>4</sub> /RxD	
P0 <sub>5</sub> /TxD

P1 <sub>5</sub> /AN <sub>5</sub> /KEY <sub>5</sub>	
P2 <sub>0</sub> /X <sub>OUT</sub> /X <sub>COU</sub> T	Set the direction register to "1", and perform termination of output port.
P2 <sub>1</sub> /X <sub>IN</sub> /X <sub>CIN</sub>	Perform termination of I/O port.
RESET	To use the built-in power-on reset circuit, leave the RESET pin open.

## Interrupts

The 7548 group interrupts are vector interrupts with a fixed priority scheme, and generated by 12 sources: 4 external, 7 internal, and 1 software.

The interrupt sources, vector addresses<sup>(1)</sup>, and interrupt priority are shown in Table 8.

Each interrupt except the BRK instruction interrupt has the interrupt request bit and the interrupt enable bit. These bits and the interrupt disable flag (I flag) control the acceptance of interrupt requests. Figure 19 shows an interrupt control diagram.

An interrupt requests is accepted when all of the following conditions are satisfied:

- Interrupt disable flag.....“0”
- Interrupt request bit.....“1”
- Interrupt enable bit.....“1”

Though the interrupt priority is determined by hardware, priority processing can be performed by software using the above bits and flag.

**Table 8 Interrupt vector address and priority**

Interrupt source	Priority	Vector addresses (Note 1)		Interrupt request generating conditions	Remarks
		High-order	Low-order		
Reset (Note 2)	1	FFFD <sub>16</sub>	FFFC <sub>16</sub>	At reset input	Non-maskable
Serial I/O receive	2	FFFB <sub>16</sub>	FFFA <sub>16</sub>	At completion of serial I/O data receive	Valid only when serial I/O is selected
Serial I/O transmit	3	FFF9 <sub>16</sub>	FFF8 <sub>16</sub>	At completion of serial I/O transmit shift or when transmit buffer is empty	Valid only when serial I/O is selected
INT <sub>0</sub>	4	FFF7 <sub>16</sub>	FFF6 <sub>16</sub>	At detection of either rising or falling edge of INT <sub>0</sub> input	External interrupt (active edge selectable)
INT <sub>1</sub>	5	FFF5 <sub>16</sub>	FFF4 <sub>16</sub>	At detection of either rising or falling edge of INT <sub>1</sub> input	External interrupt (active edge selectable)
Key-on wakeup	6	FFF3 <sub>16</sub>	FFF2 <sub>16</sub>	At falling of conjunction of input logical level for port P1 (at input)	External interrupt (valid at falling edge)
Capture	7	FFF1 <sub>16</sub>	FFF0 <sub>16</sub>	At detection of either rising or falling edge of Capture 0 input	External interrupt (active edge selectable)
Compare	8	FFEF <sub>16</sub>	FFEE <sub>16</sub>	At compare matched	Compare interrupt source is selected.
Timer A	9	FFED <sub>16</sub>	FFEC <sub>16</sub>	At timer A underflow	
Timer 2	10	FFEB <sub>16</sub>	FFEA <sub>16</sub>	At timer 2 underflow	
A/D conversion	11	FFE9 <sub>16</sub>	FFE8 <sub>16</sub>	At completion of A/D conversion	
Timer 1	12	FFE7 <sub>16</sub>	FFE6 <sub>16</sub>	At timer 1 underflow	STP release timer underflow
Not used	13	FFE5 <sub>16</sub>	FFE4 <sub>16</sub>		
	14	FFE3 <sub>16</sub>	FFE2 <sub>16</sub>		
	15	FFE1 <sub>16</sub>	FFE0 <sub>16</sub>		
	16	FFDF <sub>16</sub>	FFDE <sub>16</sub>		
BRK instruction	17	FFDD <sub>16</sub>	FFDC <sub>16</sub>	At BRK instruction execution	Non-maskable software interrupt

### NOTES:

1. Vector addresses contain internal jump destination addresses.
2. Reset function in the same way as an interrupt with the highest priority.

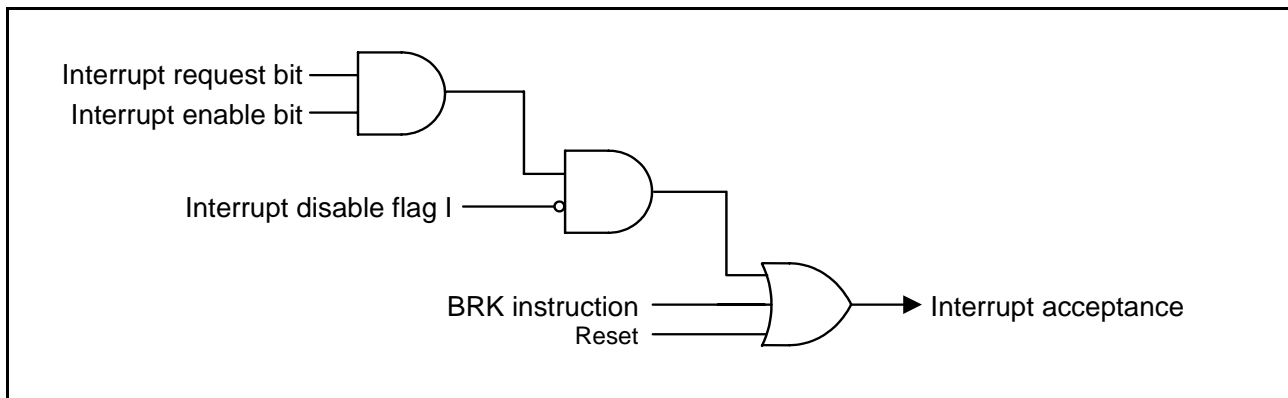

Fig 19. Interrupt control

#### • Interrupt Disable Flag

The interrupt disable flag is assigned to bit 2 of the processor status register. This flag controls the acceptance of all interrupt requests except for the BRK instruction. When this flag is set to “1”, the acceptance of interrupt requests is disabled. When it is set to “0”, acceptance of interrupt requests is enabled. This flag is set to “1” with the SET instruction and set to “0” with the CLI instruction.

When an interrupt request is accepted, the contents of the processor status register are pushed onto the stack while the interrupt disable flag remains set to “0”. Subsequently, this flag is automatically set to “1” and multiple interrupts are disabled. To use multiple interrupts, set this flag to “0” with the CLI instruction within the interrupt processing routine.

The contents of the processor status register are popped off the stack with the RTI instruction.

#### • Interrupt Request Bits

Once an interrupt request is generated, the corresponding interrupt request bit is set to “1” and remains “1” until the request is accepted. When the request is accepted, this bit is automatically set to “0”.

Each interrupt request bit can be set to “0”, but cannot be set to “1”, by software.

#### • Interrupt Enable Bits

The interrupt enable bits control the acceptance of the corresponding interrupt requests. When an interrupt enable bit is set to “0”, the acceptance of the corresponding interrupt request is disabled. If an interrupt request occurs in this condition, the corresponding interrupt request bit is set to “1”, but the interrupt request is not accepted. When an interrupt enable bit is set to “1”, acceptance of the corresponding interrupt request is enabled.

Each interrupt enable bit can be set to “0” or “1” by software. The interrupt enable bit for an unused interrupt should be set to “0”.

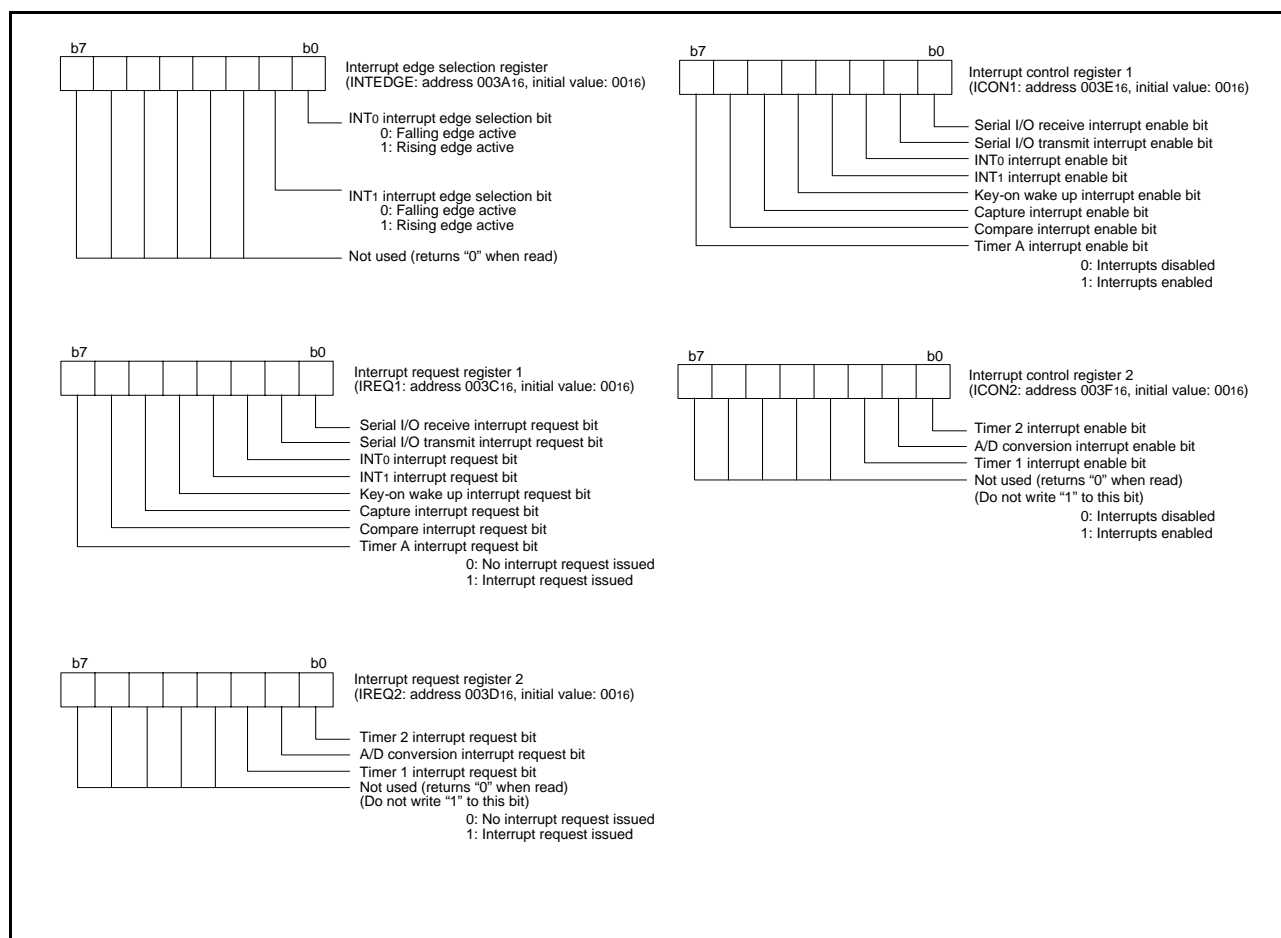

Fig 20. Structure of Interrupt-related registers

### • Interrupt Request Generation, Acceptance, and Handling

Interrupts have the following three phases.

- (i) **Interrupt Request Generation**  
An interrupt request is generated by an interrupt source (external interrupt signal input, timer underflow, etc.) and the corresponding request bit is set to “1”.
- (ii) **Interrupt Request Acceptance**  
Based on the interrupt acceptance timing in each instruction cycle, the interrupt control circuit determines acceptance conditions (interrupt request bit, interrupt enable bit, and interrupt disable flag) and interrupt priority levels for accepting interrupt requests. When two or more interrupt requests are generated simultaneously, the highest priority interrupt is accepted. The value of interrupt request bit for an unaccepted interrupt remains the same and acceptance is determined at the next interrupt acceptance timing point.
- (iii) **Handling of Accepted Interrupt Request**  
The accepted interrupt request is processed.

Figure 21 shows the time up to execution in the interrupt processing routine, and Figure 22 shows the interrupt sequence. Figure 23 shows the timing of interrupt request generation, interrupt request bit, and interrupt request acceptance.

### • Interrupt Handling Execution

When interrupt handling is executed, the following operations are performed automatically.

- (1) Once the currently executing instruction is completed, an interrupt request is accepted.
- (2) The contents of the program counters and the processor status register at this point are pushed onto the stack area in order from 1 to 3.
  1. High-order bits of program counter (PCH)
  2. Low-order bits of program counter (PCL)
  3. Processor status register (PS)
- (3) Concurrently with the push operation, the jump address of the corresponding interrupt (the start address of the interrupt processing routine) is transferred from the interrupt vector to the program counter.
- (4) The interrupt request bit for the corresponding interrupt is set to “0”. Also, the interrupt disable flag is set to “1” and multiple interrupts are disabled.
- (5) The interrupt routine is executed.
- (6) When the RTI instruction is executed, the contents of the registers pushed onto the stack area are popped off in the order from 3 to 1. Then, the routine that was before running interrupt processing resumes.

As described above, it is necessary to set the stack pointer and the jump address in the vector area corresponding to each interrupt to execute the interrupt processing routine.

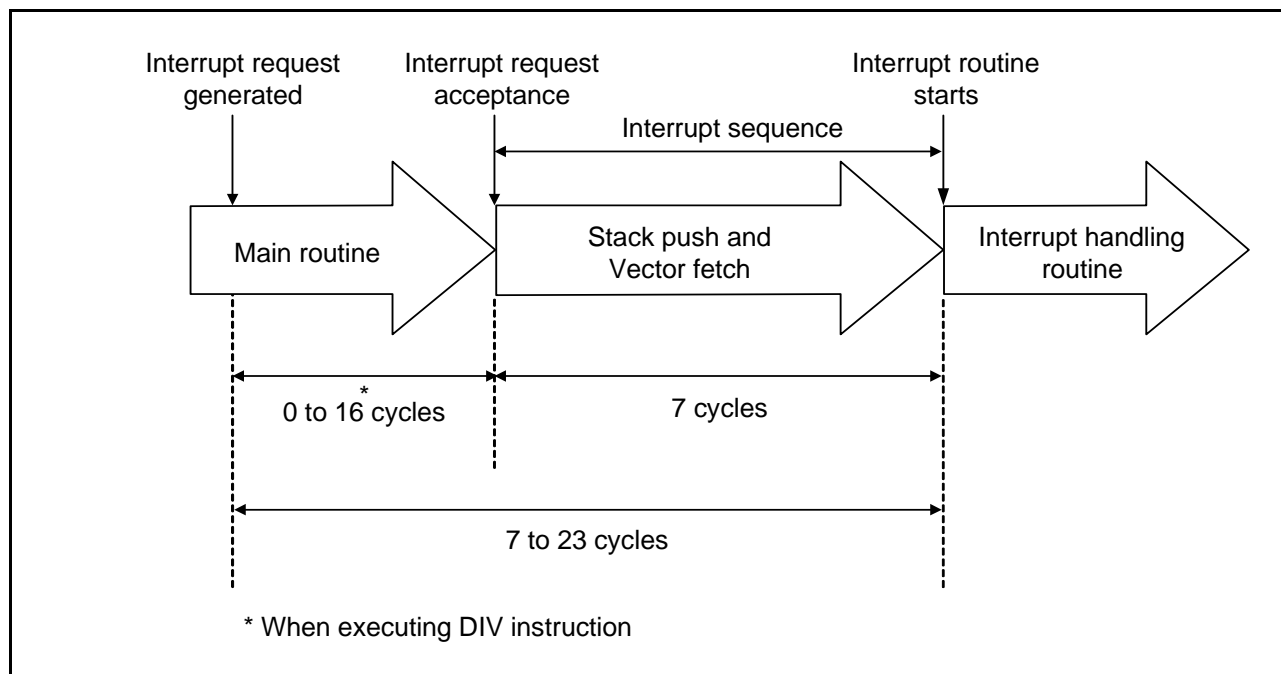

Fig 21. Time up to execution in interrupt routine

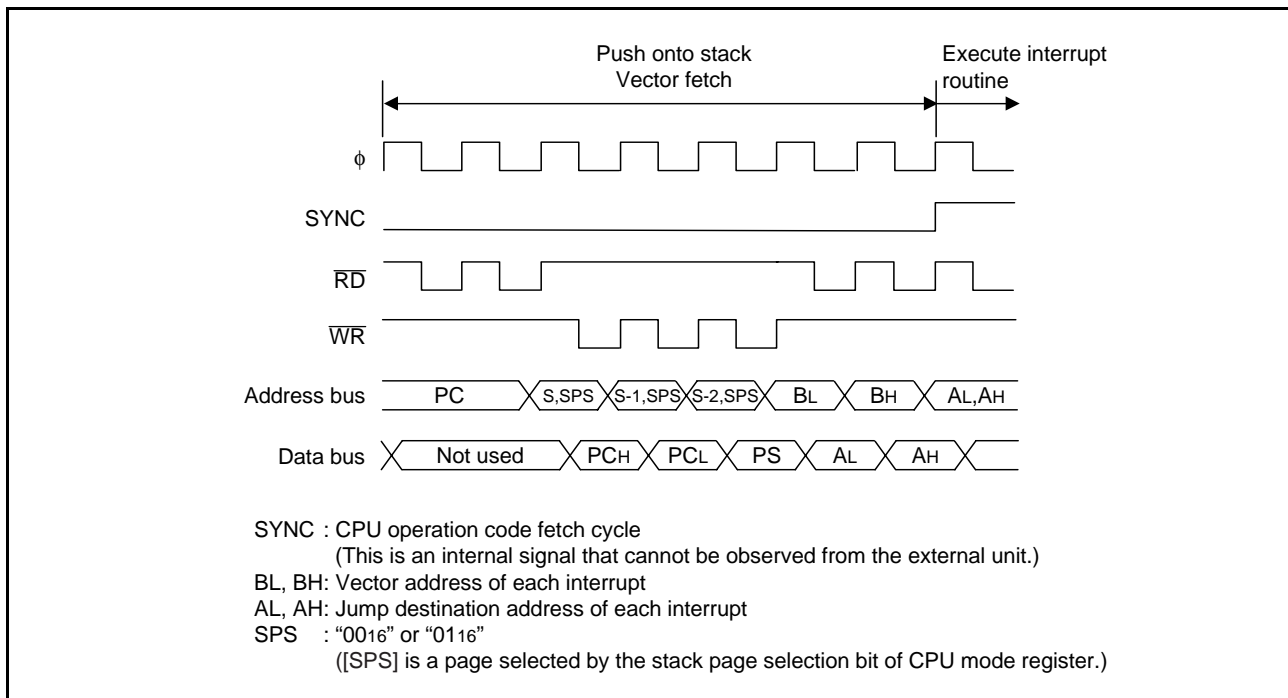

Fig 22. Interrupt sequence

Fig 23. Timing of interrupt request generation, interrupt request bit, and interrupt acceptance

**<Notes>**

The interrupt request bit may be set to "1" in the following cases.

<When switching external interrupt active edge>

- INT0 interrupt edge selection bit  
(bit 0 of Interrupt edge selection register (address 3A16))
- INT1 interrupt edge selection bit  
(bit 1 of Interrupt edge selection register)

If it is not necessary to generate an interrupt synchronized with these settings, take the following sequence.

- (1) Set the corresponding enable bit to "0" (disabled).
- (2) Set the interrupt edge selection bit (the active edge switch bit) or the interrupt source bit.
- (3) Set the corresponding interrupt request bit to "0" after one or more instructions have been executed.
- (4) Set the corresponding interrupt enable bit to "1" (enabled).

### Key Input Interrupt (Key-On Wakeup)

A key-on wakeup interrupt request is generated by applying “L” level to any pin of port P1 that has been set to input mode.

In other words, it is generated when the AND of input level goes from “1” to “0”. An example of using a key input interrupt is shown in Figure 24, where an interrupt request is generated by pressing one of the keys provided as an active-low key matrix which uses ports P10 to P13 as input ports.

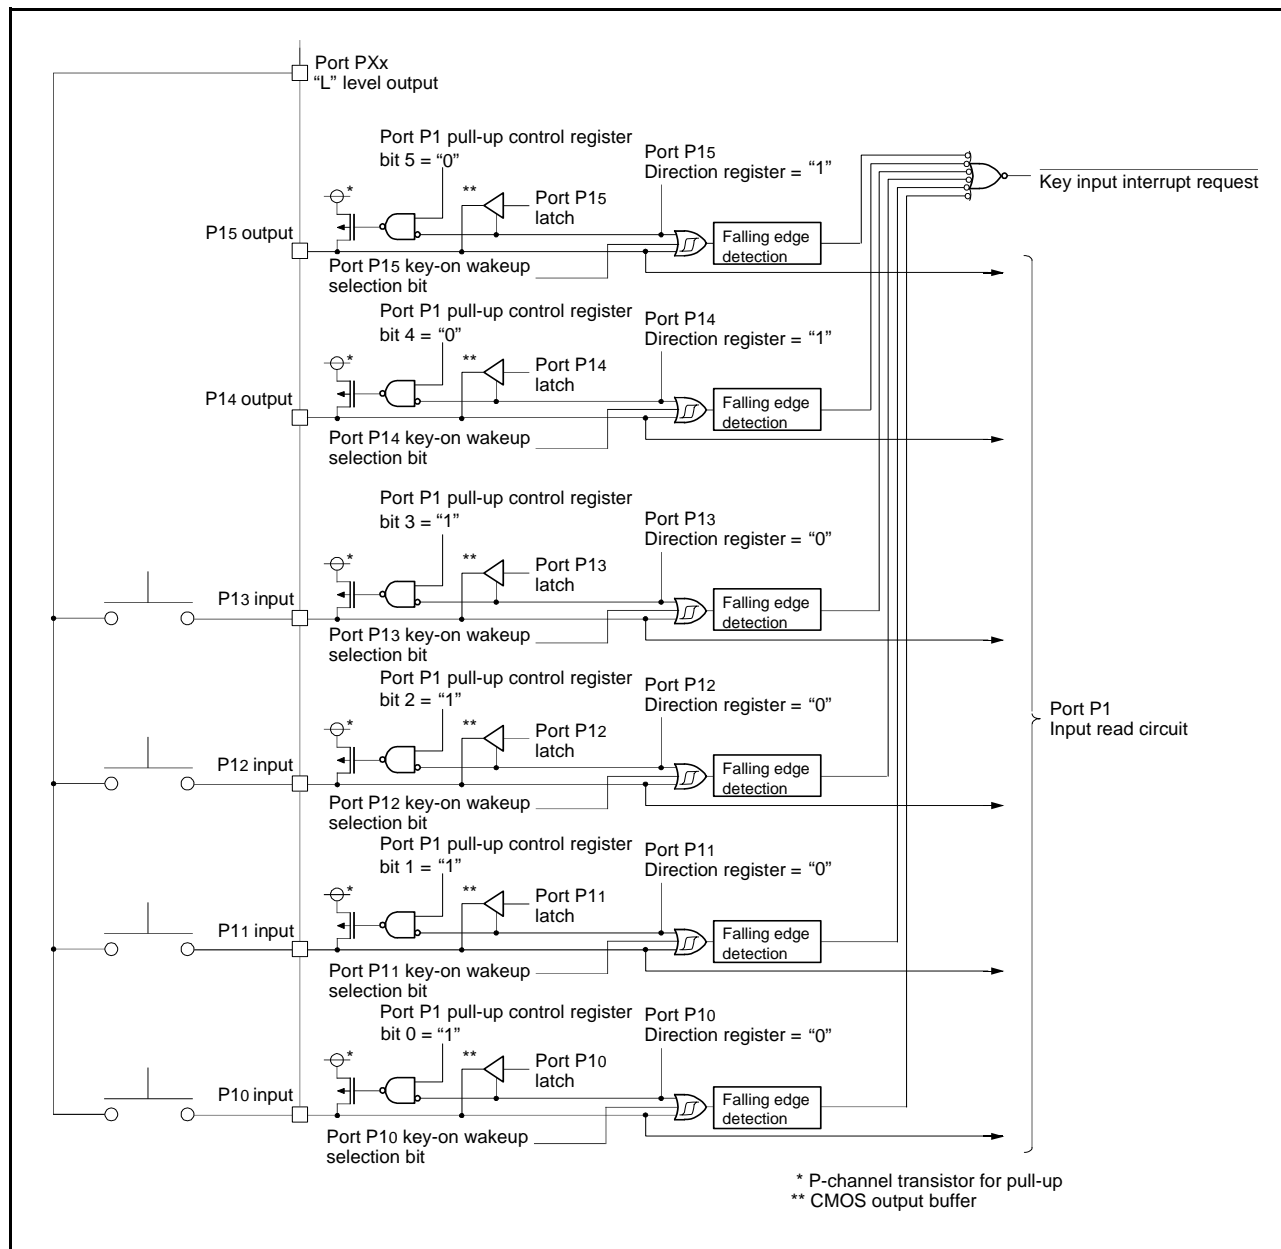

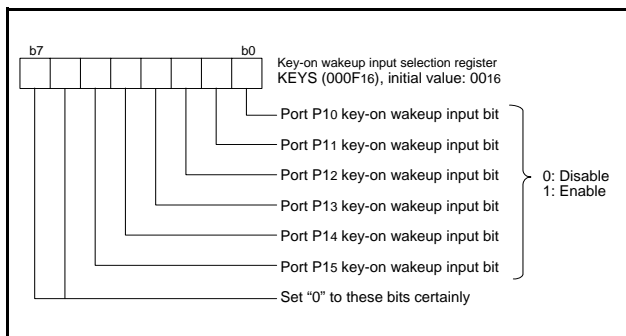

Fig 24. Connection example when using key input interrupt and port P1 block diagram

**[Key-on wakeup input selection register] KEYS**

Either of enable or disable of key-on wakeup for pins P10 to P15 can be selected by the key-on wakeup input selection bit, respectively.

**Fig 25. Structure of key input control register**

## Timers

The 7548 Group has two 8-bit timers (timer 1 and timer 2) and one 16-bit timer (timer A).

Timer 1 and timer 2 share the same 8-bit prescaler (prescaler 12). Each timer and prescaler has a separate timer latch and prescaler latch.

The division ratio of every timer and prescaler is  $1/(n+1)$ , where  $n$  is the value of the timer latch or prescaler latch.

The timers decrement at each count clock input. When the count value reaches "0", an underflow occurs at the next count pulse. The value of the corresponding timer latch is reloaded into the timer at underflow and counting is continued. When a timer underflow occurs, the interrupt request bit corresponding to each timer is set to "1".

### • Prescaler 12 (PRE12)

Prescaler 12 is an 8-bit prescaler that counts the signal selected by the prescaler 12 count source selection bit. The count source can be selected from  $\phi$ SOURCE/16 and XCIN input clock.

Writing to prescaler 12 writes the value to both the prescaler latch and prescaler.

Reading from prescaler 12 reads the prescaler 12 count value. The initial value is set to "FF16" after reset.

The division ratio of prescaler 12 is  $1/(n+1)$ , where  $n$  is the setting value.

Prescaler 12 cannot stop counting by software.

### • Timer 1 (T1)

Timer 1 is an 8-bit timer that counts the prescaler 12 output.

When Timer 1 underflows, the timer 1 interrupt request bit is set to "1".

Writing to timer 1 writes the value to both the timer 1 latch and timer 1.

Reading from timer 1 reads the timer 1 count value. The initial value is set to "0116" after reset.

The division ratio of timer 1 is  $1/(m+1)$ , where  $m$  is the setting value. This gives that the division ratio of prescaler 12 and timer 1 is  $1/((n+1) \times (m+1))$ , where  $n$  is the prescaler 12 setting value and  $m$  is the timer 1 setting value.

Timer 1 cannot stop counting by software.

### • Timer 2 (T2)

Timer 2 is an 8-bit timer that counts the signal selected by the timer 2 count source selection bit.

The count source can be selected from among  $\phi$ SOURCE/16, /256, prescaler 12 output, and timer A output signal.

Timer 2 counts the selected count source and sets the timer 2 interrupt request bit to "1" at underflow.

When writing to timer 2, the value of the timer 2 write control bit can be used to select a write to both the timer 2 latch and timer 2 or a write to only the timer 2 latch.

Reading from timer 2 reads the timer 2 count value.

Timer 2 starts counting from "FF16" after reset.

The division ratio of timer 2 is  $1/(n+1)$ , where  $n$  is the timer 2 setting value. Timer 2 stops when the timer 2 count stop bit is set to "1".

When the P13/T2OUT output valid bit is set to "1", the polarity of the waveform output from the P13/T2OUT pin can be inverted at each timer 2 underflow. The output start level of the T2OUT pin can be selected using the T2OUT polarity switch bit. When this bit is set to 0, the output starts at "H" level. When this bit is set to "1", the output starts at "L" level.

## • Notes

### (1) Reading from and Writing to Timer 1 and 2 and Prescaler 12

If the timer/prescaler count source clock and  $\phi$ SOURCE are different clocks, the timers and prescaler cannot be read or written. Select the same clock to enable read and write operations.

Note that timer 2 can be read and written even using a different clock while its counting is stopped.

① Prescaler 12 and timer 1 cannot be read/written in the following conditions:

Prescaler 12 count source: XCIN input clock

$\phi$ SOURCE: Clock other than XCIN input clock

② Timer 2 cannot be read/written during counting in the following conditions:

Timer 2 count source: Prescaler 12

Prescaler 12 count source: XCIN input clock

$\phi$ SOURCE: Clock other than XCIN input clock

or

Timer 2 count source: Timer A underflow

Timer A count source: XCIN input clock

$\phi$ SOURCE: Clock other than XCIN input clock

or

Timer 2 count source: Timer A underflow

Timer A count source: low-speed on-chip oscillator output

$\phi$ SOURCE: Clock other than low-speed on-chip oscillator

### (2) Count Source of Prescaler 12

The XCIN input clock can be selected as the prescaler count source only if the 32 kHz quartz crystal oscillator is selected by the oscillation method selection bit in FSR0M1.

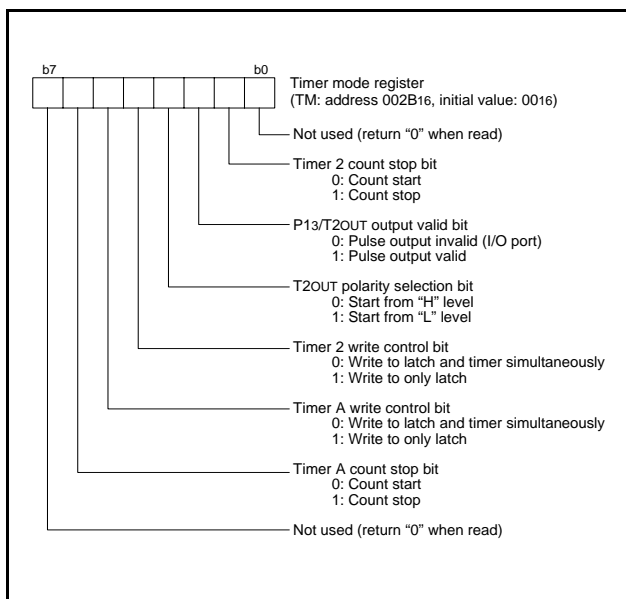

Fig 26. Structure of timer mode register

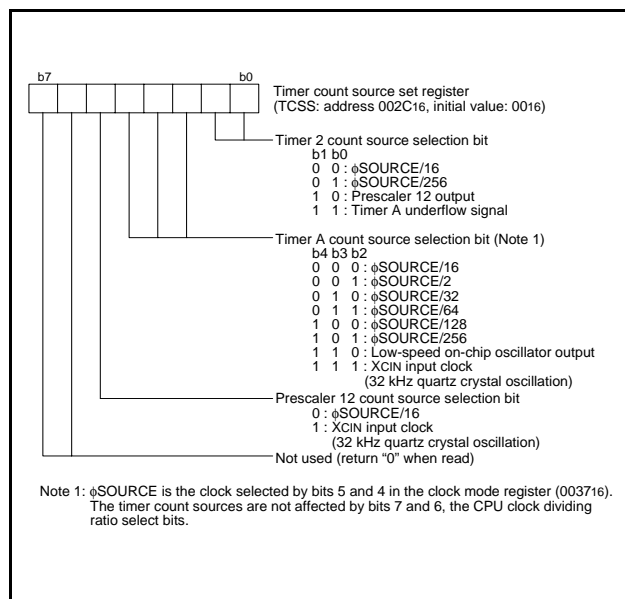

Fig 27. Structure of timer count source set register

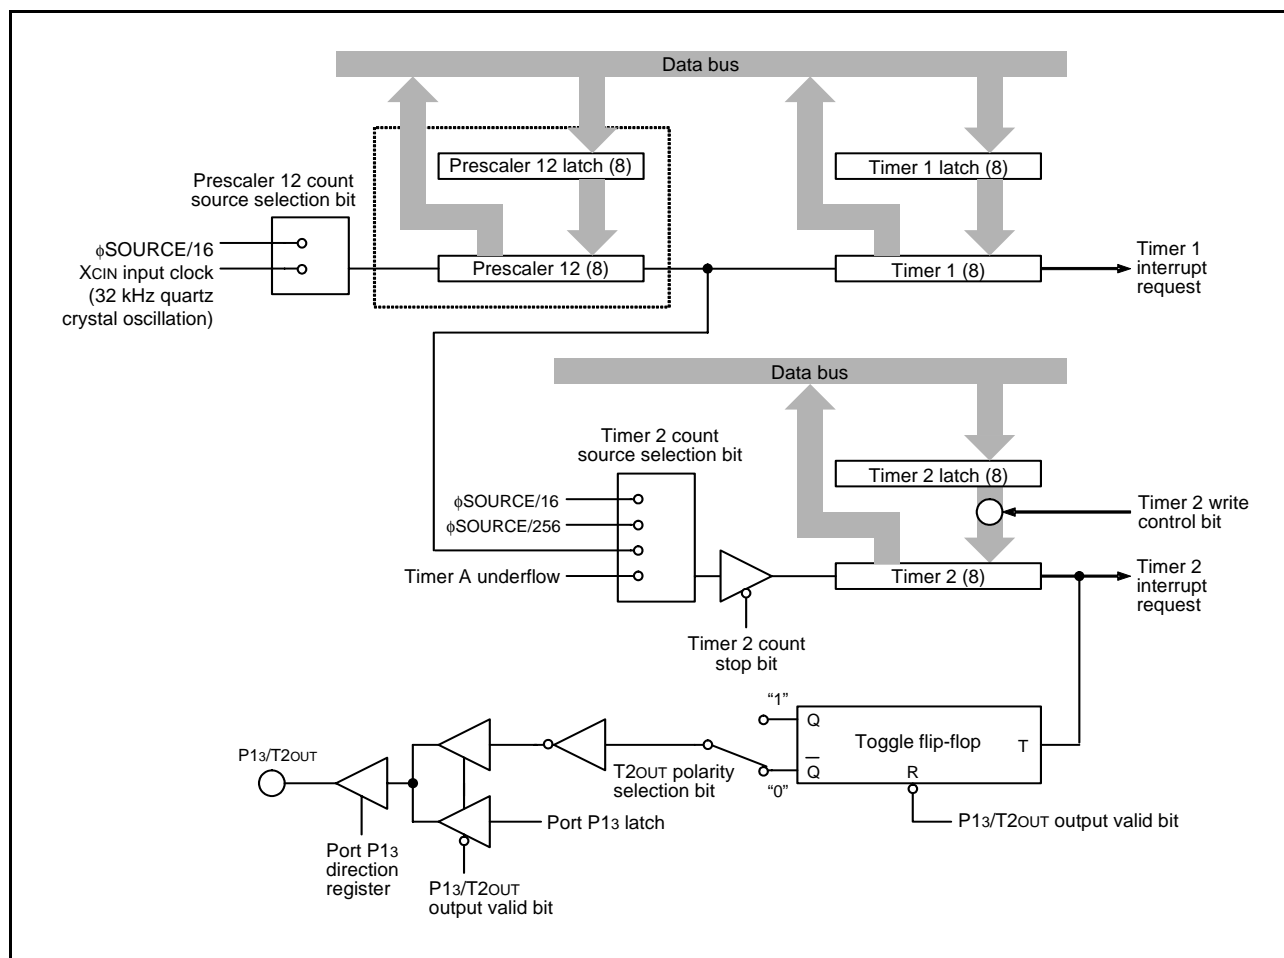

Fig 28. Block diagram of timer 1 and timer 2

### Timer A (TA)

Timer A is a 16-bit timer and counts the signal selected by the timer A count source selection bit.

The count source of Timer A can be selected from among  $\phi$ SOURCE/2, /16, /32, /64, /128, /256, low-speed on-chip oscillator clock, and XCIN input clock.

Timer A counts the selected count source and sets the timer A interrupt request bit to "1".

When writing to timer A, the setting value of the timer A write control bit can be used to select a write to both the timer A latch and timer or a write to only the timer A latch.

Reading from timer A reads the timer A count value.

Be sure to write to and read from the low-order and the higher order of timer A in the following order:

- Read
  - Read the high-order of Timer A (TAH) first, and the low-order of Timer A (TAL) next. Always read both of the registers.
- Write
  - Write to the low-order of Timer A (TAL) first and the high-order of Timer A next. Always read both of the registers.

Counting starts from "FFFF16" after reset.

The division ratio of timer A is  $1/(n+1)$ , where  $n$  is the timer A setting value. Timer A stops when the timer A count stop bit is set to "1".

Timer A can be used as the timing timer for input capture and output compare functions.

### • Notes

#### (1) Timer Value Setting

When the timer A write control bit is set to "write to only latch", written data is written to only to the latch even when the timer is stopped. To set the initial setting value when the timer is stopped, select "Write to timer and latch simultaneously" beforehand.

#### (2) Reading from and Writing to Timer A

If the timer A count source clock and  $\phi$ SOURCE are different clocks, timer A cannot be read or written during its counting. Select the same clock or set timer A to stop counting to enable read and write operations.

- Timer A cannot be read/written in the following conditions:

Timer A count source: XCIN input clock

$\phi$ SOURCE: Clock other than XCIN input clock

or

Timer A count source: Low-speed on-chip oscillator output

$\phi$ SOURCE: Clock other than low-speed on-chip oscillator

#### (3) Count Source of Timer A

The XCIN input clock can be selected as the count source of timer A only if the 32 kHz quartz crystal oscillator is selected by the oscillation method selection bit in FSROM1.

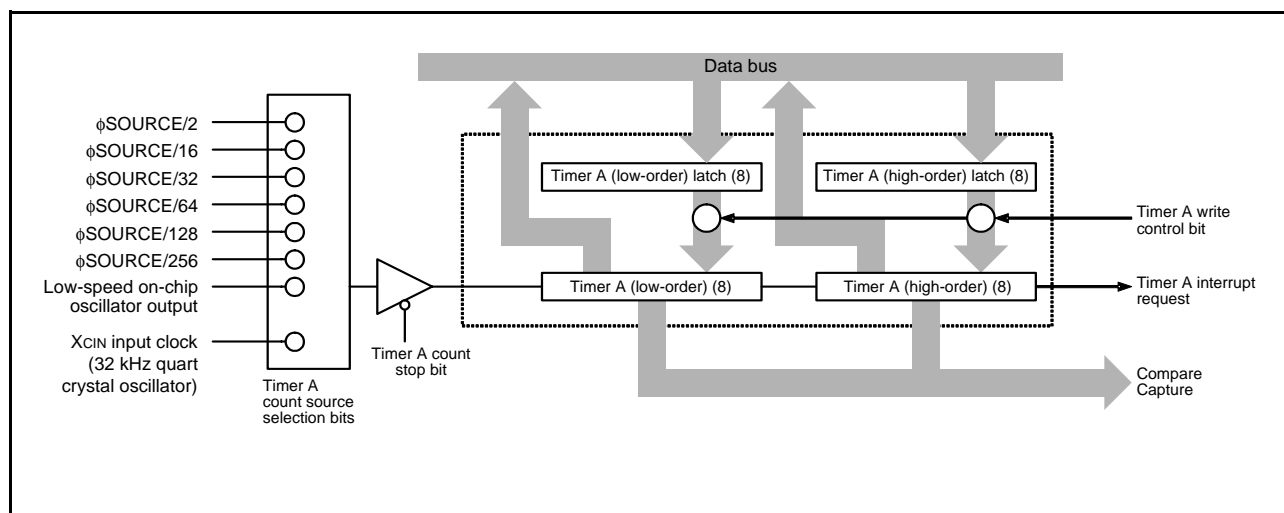

Fig 29. Block diagram of timer A

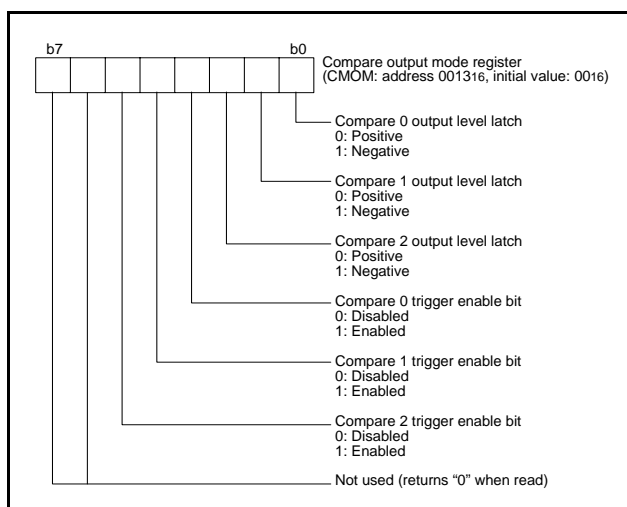

Fig 34. Structure of compare output mode register

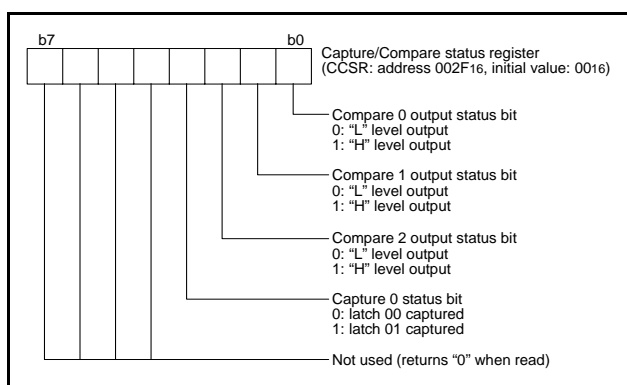

Fig 35. Structure of capture/compare status register

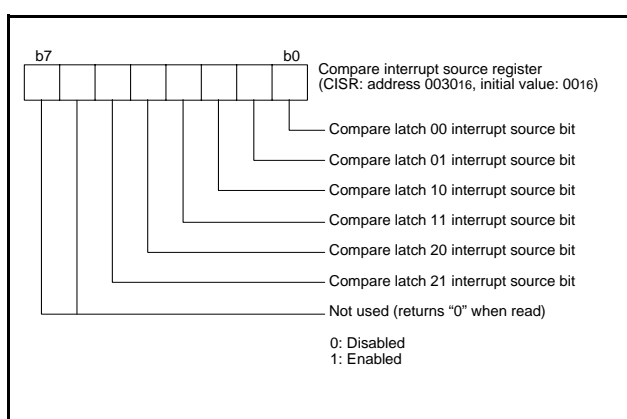

Fig 36. Structure of compare interrupt source register

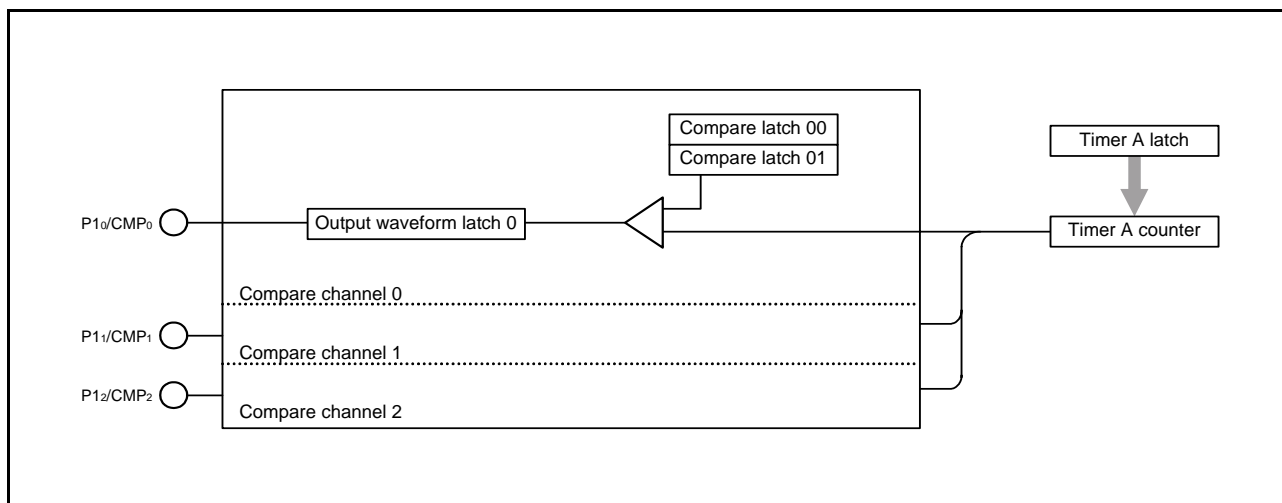

Fig 37. Block diagram of compare output circuit

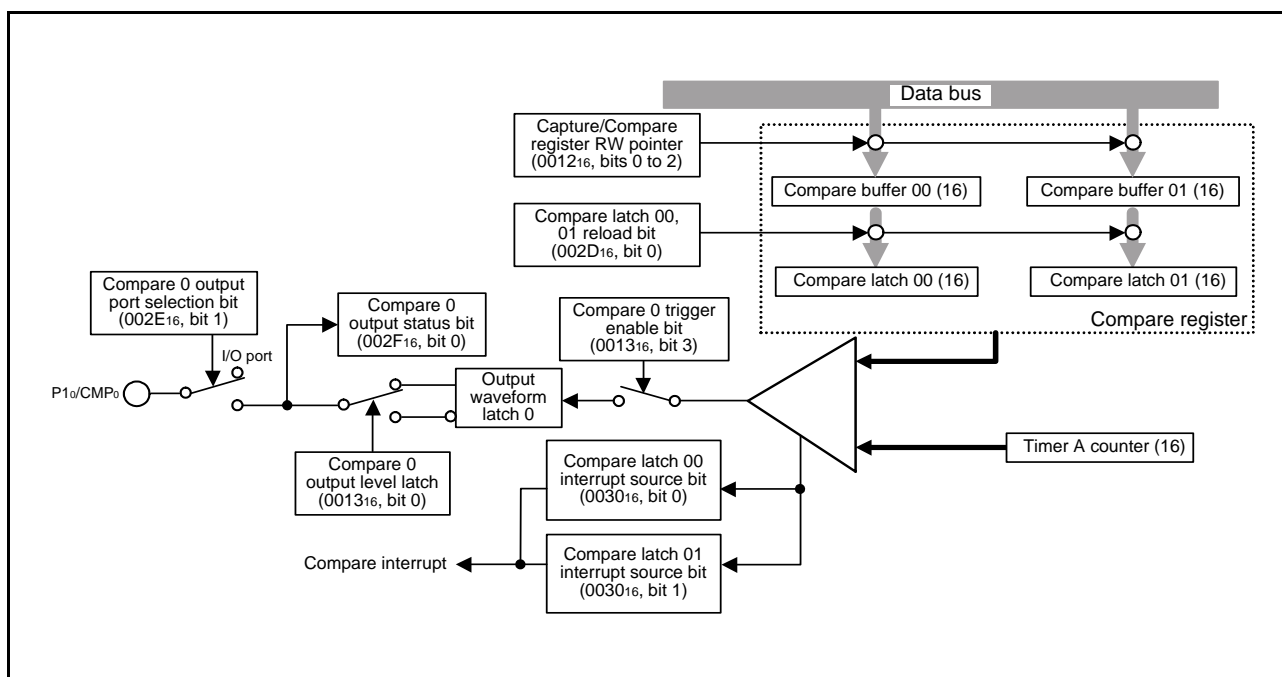

Fig 38. Block diagram of compare channel 0

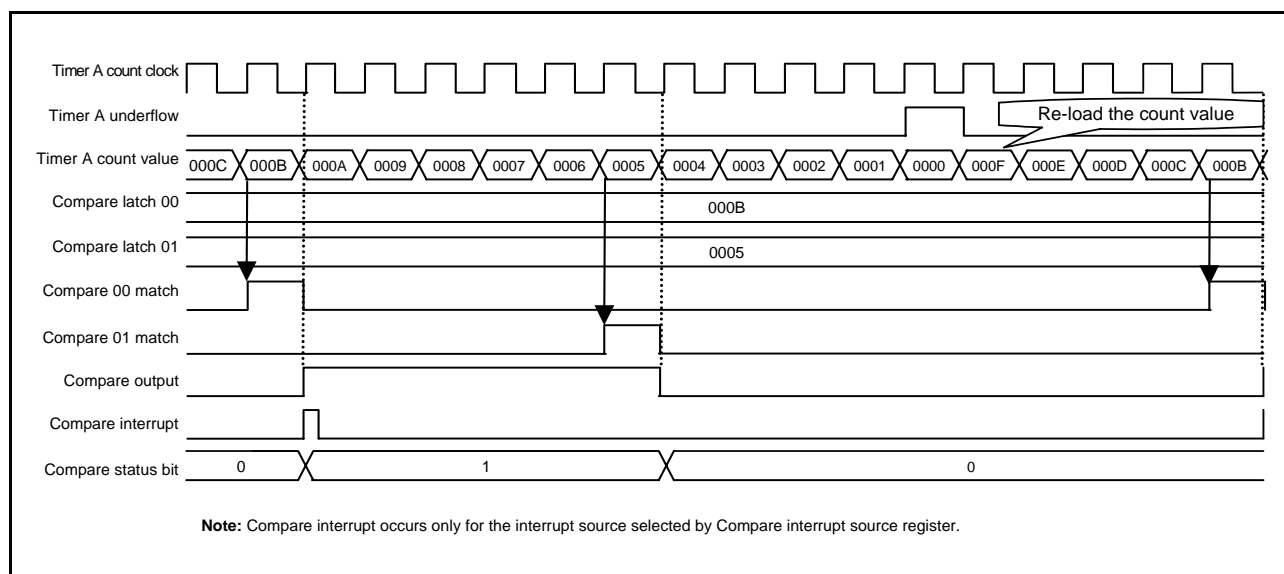

Fig 39. Output compare mode (general waveform)

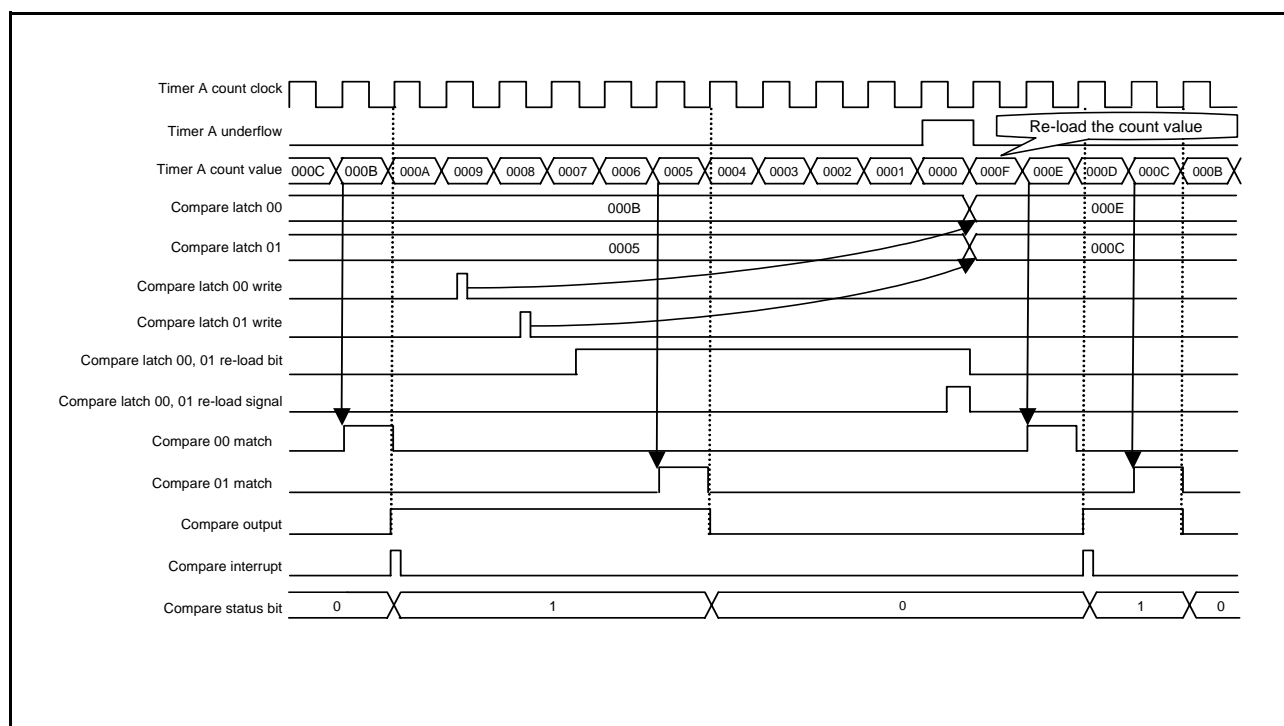

Fig 40. Output compare mode (compare register write timing)

### Input capture

7548 group has 1-input capture channel and can be used to capture count value of Timer A.

Input capture shares the registers with three output compare channels, but their individual circuits operate independently so that all the channels can be used at the same time.

To use input capture, set the capture 0 input port selection bits. If P03 is selected, set the P03 direction register to 0. When an input capture trigger is input to the input capture circuit, the count value of timer A is saved to the capture latches. The timer count value at the rising edge of the external input trigger is saved to capture latch 00, and the timer count value at the falling edge of the external input trigger is saved to capture latch 01. Capture latch 00 and capture latch 01 can be read using the following procedure.

1. Set the capture/compare register RW pointer to the read target address.
2. Read the high-order bits of the capture/compare registers, then read the low-order bits of the capture/compare registers. (Read both the capture/compare registers in the sequence of high-order bits followed by low-order bits.)

The count value of timer can be retained by software by capture y (y = 00, 01, 10, 11) software trigger bit too. When "1" is set to this bit, count value of timer is retained to the corresponded capture latch.

When reading from the capture y software trigger bit is executed, "0" is read out.

#### • Notes

- When the low-speed on-chip oscillator output or XCIN input clock is selected as the count source of timer A, input capture can be used only if the same clock source is selected as  $\phi$ SOURCE and as the count source of timer A.
- When writing "1" to capture y software trigger bit of capture latch 00 and 01 at the same time, or external trigger and software trigger occur simultaneously, if capture latches 00 and 01 are input simultaneously, the set value of capture 0 status bit is undefined.
- When setting the interrupt active edge selection bit and noise filter clock selection bit of capture 0 the interrupt request bit may be set to "1".

When not requiring the interrupt occurrence synchronized with these setting, take the following sequence.

- (1) Set the capture interrupt enable bit to "0" (disabled).
  - (2) Set the interrupt edge selection bit or noise filter clock selection bit.
  - (3) Set the corresponding interrupt request bit to "0" after 1 or more instructions have been executed.
  - (4) Set the capture interrupt enable bit to "1" (enabled).
- When the capture interrupt is used as the interrupt for return from stop mode, set the capture 0 noise filter clock selection bits to "00 (Filter stop)".

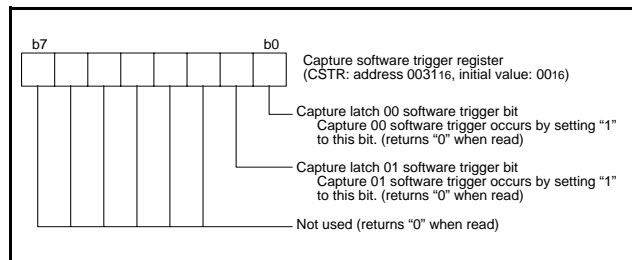

Fig 41. Structure of capture software trigger register

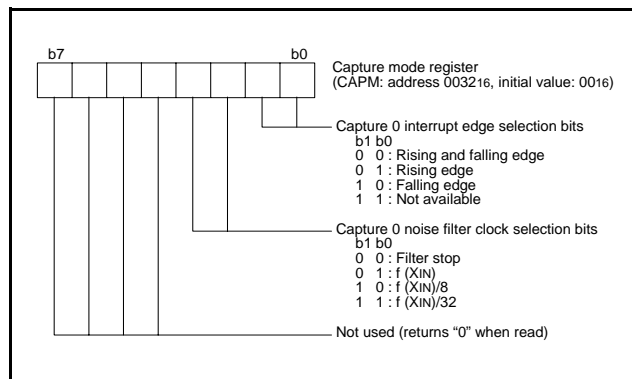

Fig 42. Structure of capture mode register

## Serial Interface

### • Serial I/O

Serial I/O can be used as either clock synchronous or asynchronous (UART) serial I/O. A dedicated timer is also provided for baud rate generation.

### (1) Clock Synchronous Serial I/O Mode

Clock synchronous serial I/O mode can be selected by setting the serial I/O mode selection bit of the serial I/O control register (bit 6) to "1".

For clock synchronous serial I/O, the transmitter and the receiver must use the same clock. If an internal clock is used, transfer is started by a write signal to the TB/RB.

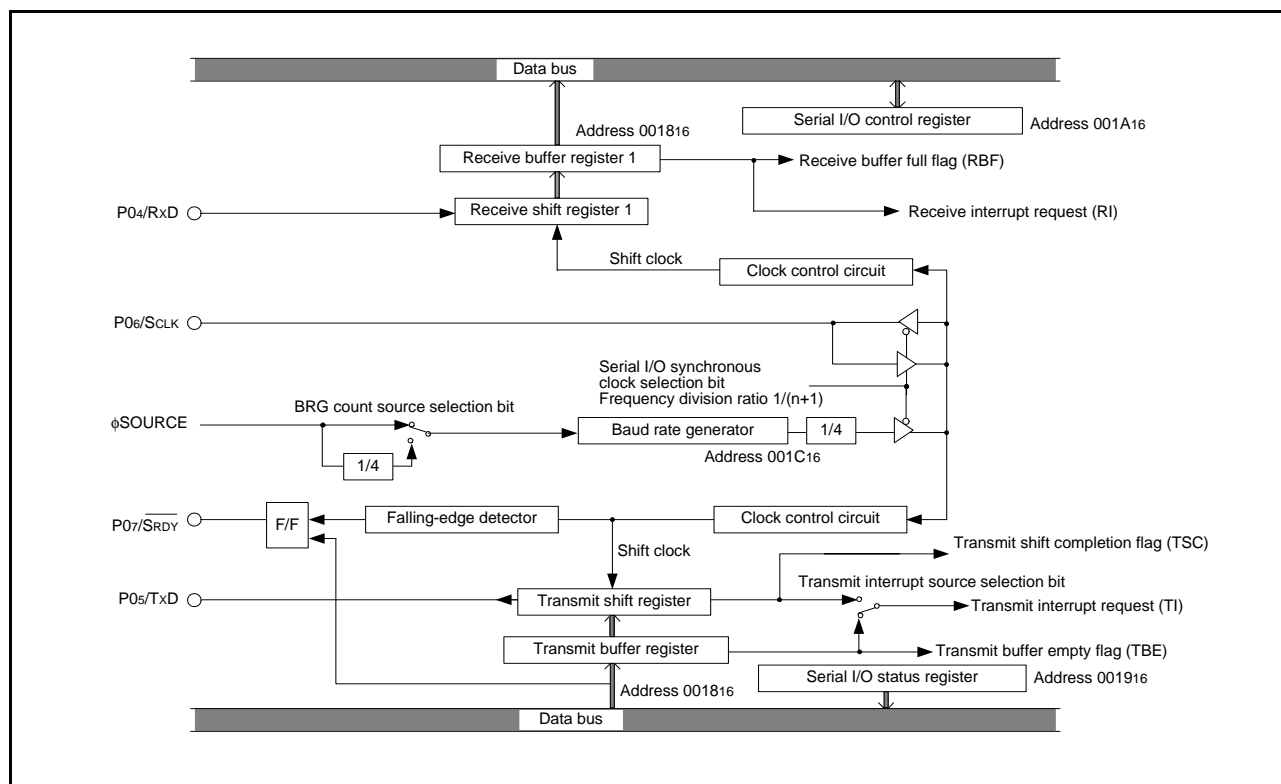

Fig 46. Block diagram of clock synchronous serial I/O

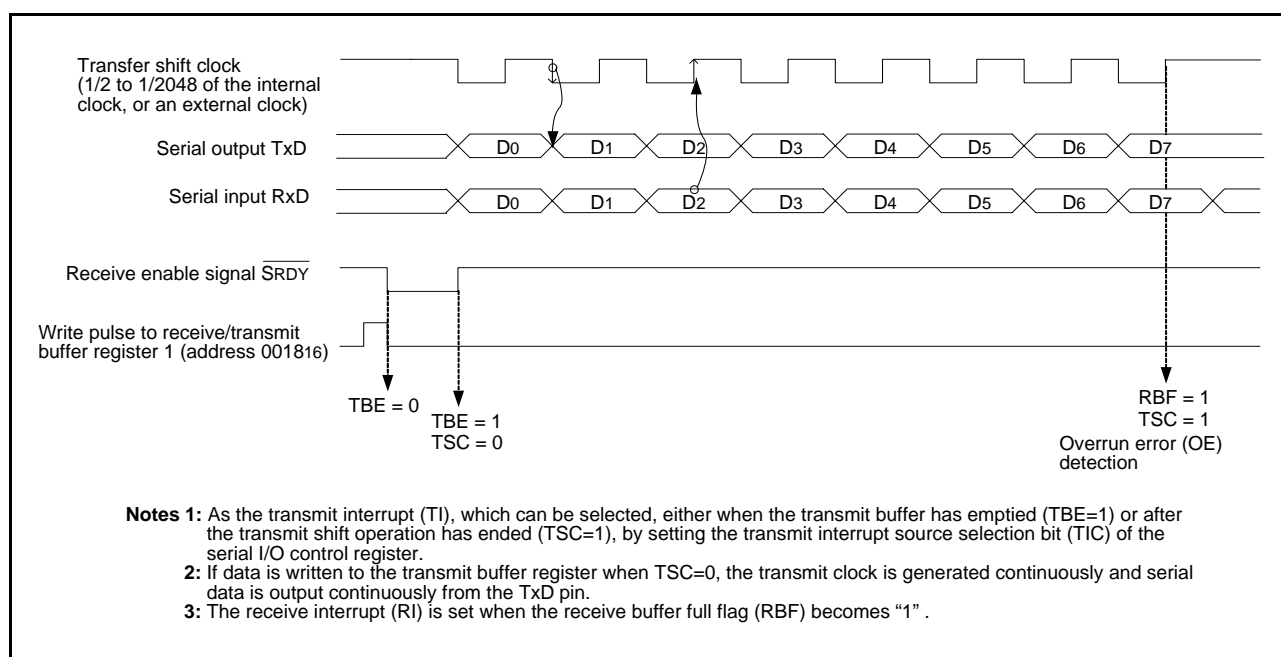

Fig 47. Operation of clock synchronous serial I/O function

## (2) Asynchronous Serial I/O (UART) Mode

Clock asynchronous serial I/O mode (UART) can be selected by clearing the serial I/O mode selection bit of the serial I/O control register to "0".

Eight serial data transfer formats can be selected, and the transfer formats used by a transmitter and receiver must be identical.

The transmit and receive shift registers each have a buffer, but the two buffers have the same address in memory. Since the shift register cannot be written to or read from directly, transmit data is written to the transmit buffer register, and receive data is read from the receive buffer register.

The transmit buffer register can also hold the next data to be transmitted, and the receive buffer register can hold a character while the next character is being received.

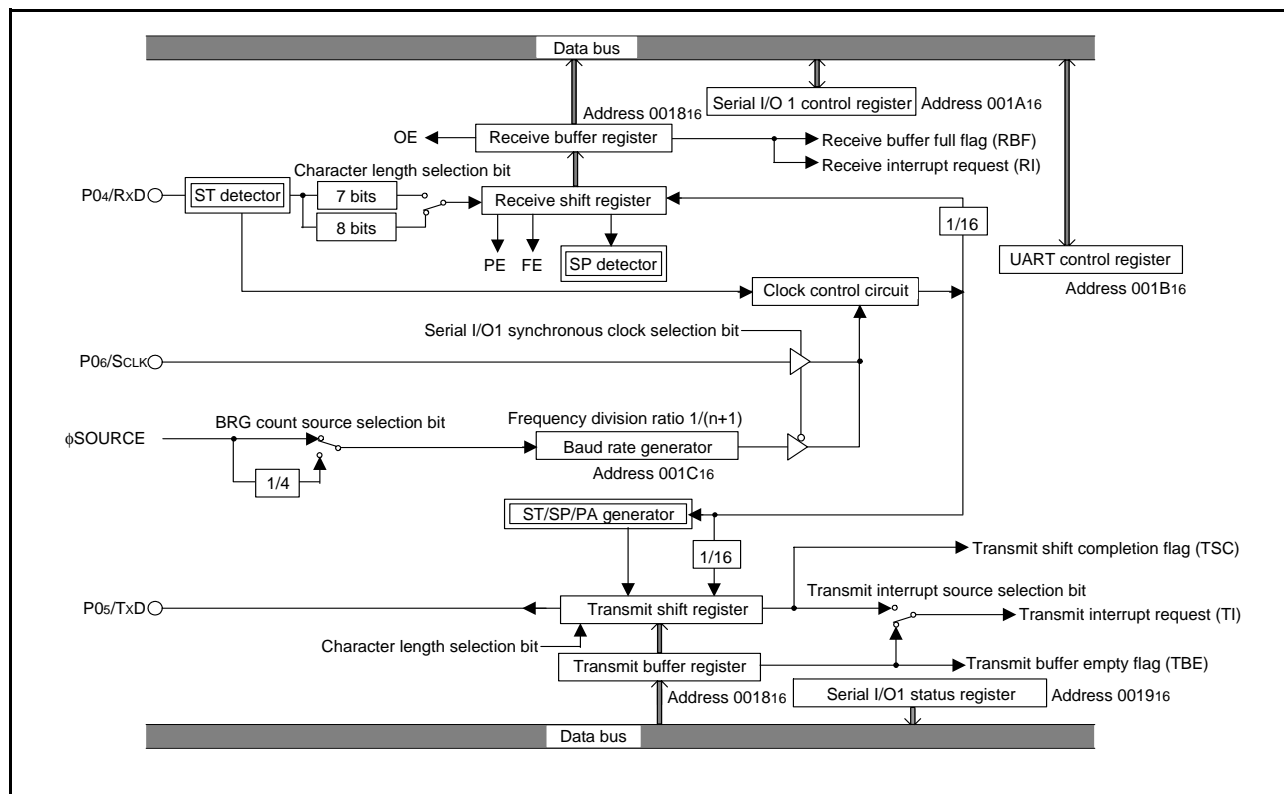

Fig 48. Block diagram of UART serial I/O

Fig 49. Operation of UART serial I/O function

**[Transmit buffer register/receive buffer register (TB/RB)] 0018<sub>16</sub>**

The transmit buffer register and the receive buffer register are located at the same address. The transmit buffer is write-only and the receive buffer is read-only. If a character bit length is 7 bits, the MSB of data stored in the receive buffer is "0".

**[Serial I/O status register (SIOSTS)] 0019<sub>16</sub>**

The read-only serial I/O status register consists of seven flags (bits 0 to 6) which indicate the operating status of the serial I/O function and various errors.

Three of the flags (bits 4 to 6) are valid only in UART mode.

The receive buffer full flag (bit 1) is cleared to "0" when the receive buffer register is read.

If there is an error, it is detected at the same time that data is transferred from the receive shift register to the receive buffer register, and the receive buffer full flag is set. A write to the serial I/O status register clears all the error flags OE, PE, FE, and SE (bit 3 to bit 6, respectively). Writing "0" to the serial I/O enable bit SIOE (bit 7 of the serial I/O control register) also clears all the status flags, including the error flags.

Bits 0 to 6 of the serial I/O status register are initialized to "0" at reset, but if the transmit enable bit of the serial I/O control register has been set to "1", the transmit shift completion flag (bit 2) and the transmit buffer empty flag (bit 0) become "1".

**[Serial I/O control register (SIOCON)] 001A<sub>16</sub>**

The serial I/O control register consists of eight control bits for the serial I/O function.

**[UART control register (UARTCON)] 001B<sub>16</sub>**

The UART control register consists of four control bits (bits 0 to 3) which are valid when asynchronous serial I/O is selected and set the data format of an data transfer and one bit (bit 4) which is always valid and sets the output structure of the P05/TxD pin.

**[Baud rate generator (BRG)] 001C<sub>16</sub>**

The baud rate generator determines the baud rate for serial transfer.

The baud rate generator divides the frequency of the count source by  $1/(n + 1)$ , where  $n$  is the value written to the baud rate generator.

**•Notes****• Serial I/O interrupt**

When setting the transmit enable bit to "1", the serial I/O transmit interrupt request bit is automatically set to "1". When not requiring the interrupt occurrence synchronized with the transmission enabled, take the following sequence.

1. Set the serial I/O transmit interrupt enable bit to "0" (disabled).
2. Set the transmit enable bit to "1".
3. Set the serial I/O transmit interrupt request bit to "0" after 1 or more instructions have been executed.
4. Set the serial I/O transmit interrupt enable bit to "1" (enabled).

**• I/O pin function when serial I/O is enabled.**

The functions of P06 and P07 are switched with the setting values of a serial I/O mode selection bit and a serial I/O synchronous clock selection bit as follows.

**(1) Serial I/O mode selection bit → "1" :**

Clock synchronous type serial I/O is selected.

Setup of a serial I/O synchronous clock selection bit

"0" : P06 pin turns into an output pin of a synchronous clock.

"1" : P06 pin turns into an input pin of a synchronous clock.

Setup of a  $\overline{\text{SRDY}}$  output enable bit (SRDY)

"0" : P07 pin can be used as a normal I/O pin.

"1" : P07 pin turns into a  $\overline{\text{SRDY}}$  output pin.

**(2) Serial I/O mode selection bit → "0" :**

Clock asynchronous (UART) type serial I/O is selected.

Setup of a serial I/O synchronous clock selection bit

"0" : P06 pin can be used as a normal I/O pin.

"1" : P06 pin turns into an input pin of an external clock.

When clock asynchronous (UART) type serial I/O is selected, it is P07 pin. It can be used as a normal I/O pin.

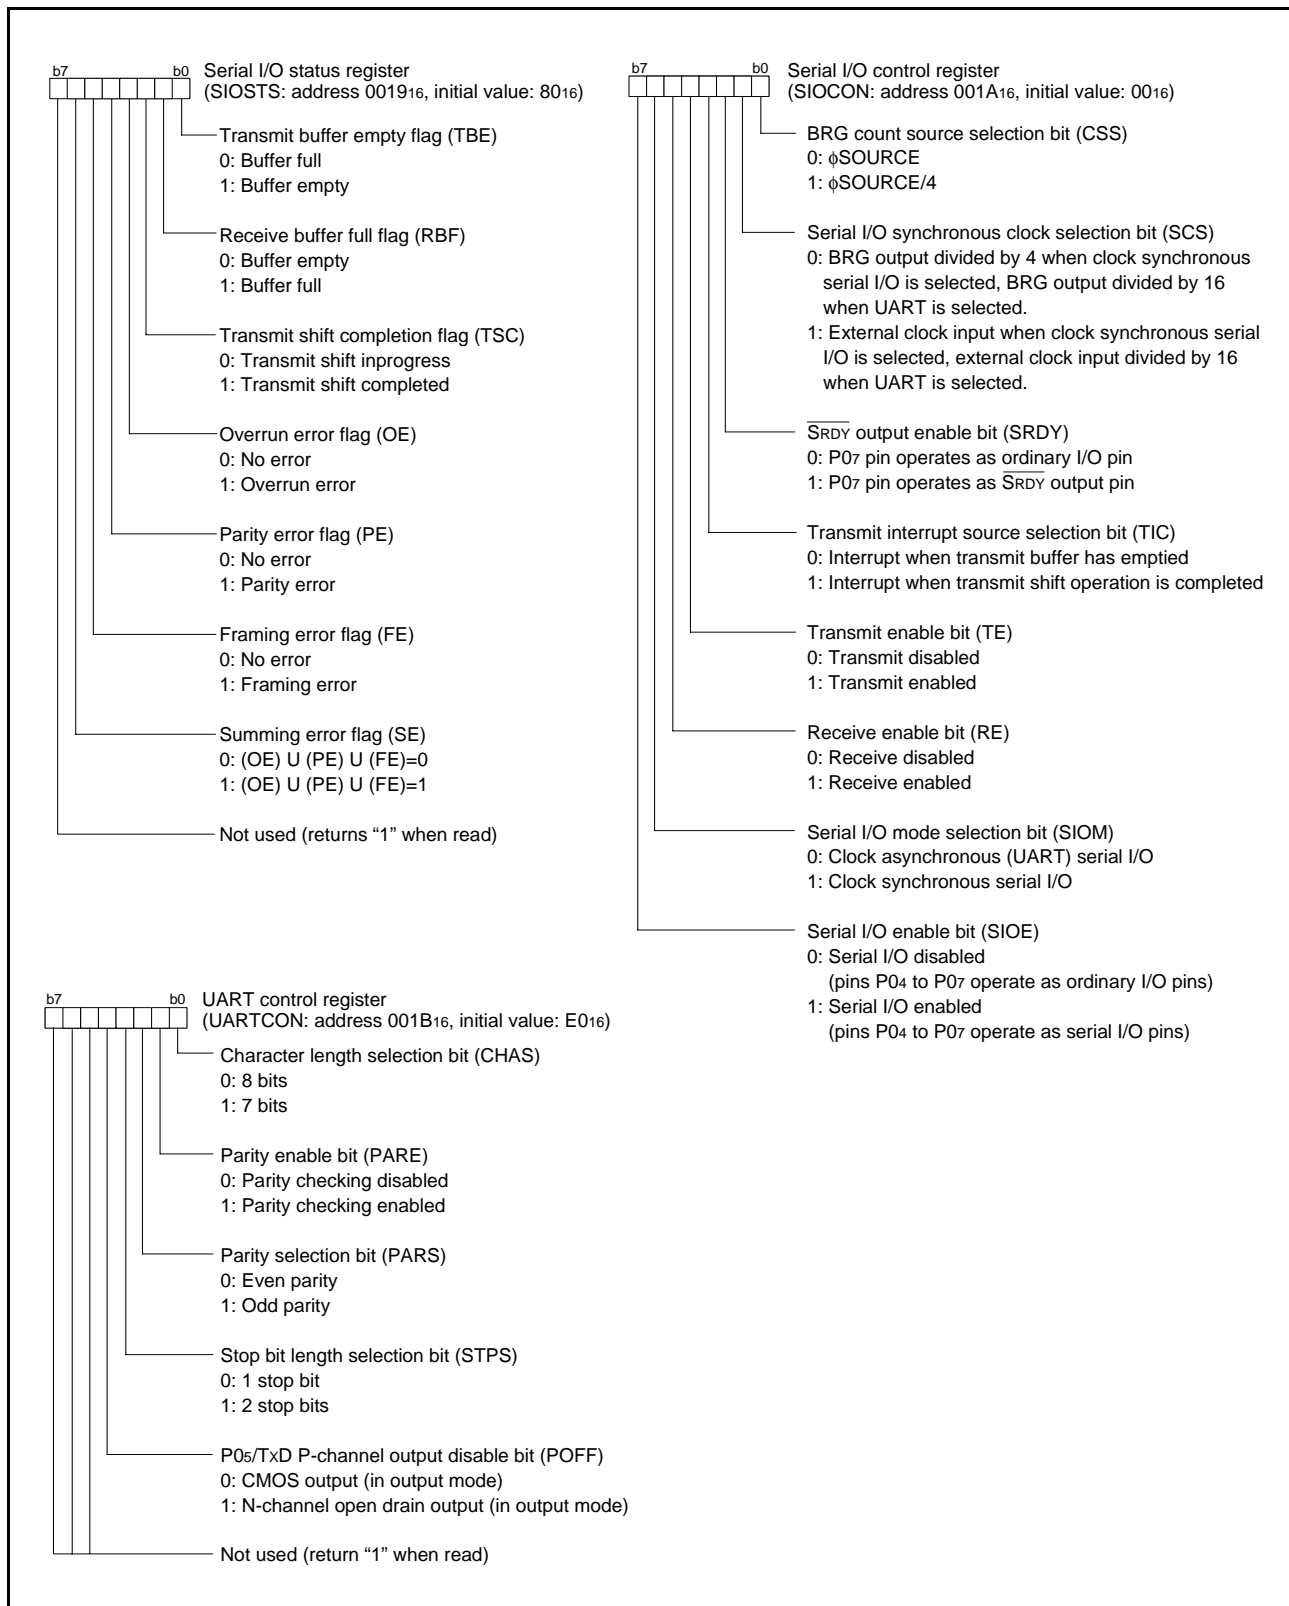

Fig 50. Structure of serial I/O1-related registers

## A/D Converter

The functional blocks of the A/D converter are described below.

### [AD conversion register] AD

The A/D conversion register is a read-only register that stores the result of A/D conversion. Do not read out this register during an A/D conversion.

### [AD control register] ADCON

The AD control register controls the A/D converter.

Bit 2 to 0 are analog input pin selection bits.

Bit 3 is the AD conversion clock selection bit. When “0” is set to this bit, the A/D conversion clock is  $\phi\text{SOURCE}/2$  and the A/D conversion time is 122 cycles of  $\phi\text{SOURCE}$ . When “1” is set to this bit, the A/D conversion clock is  $\phi\text{SOURCE}$  and the A/D conversion time is 61 cycles of  $\phi\text{SOURCE}$ .

Bit 4 is the AD conversion completion bit. The value of this bit remains at “0” during A/D conversion, and changes to “1” at completion of A/D conversion.

A/D conversion is started by setting this bit to “0”.

### [Comparison voltage generator]

The comparison voltage generator divides the voltage between  $V_{SS}$  and  $V_{CC}$  by 1024, and outputs the divided voltages.

### [Channel selector]

The channel selector selects one of ports P15/AN5 to P10/AN0, and inputs the voltage to the comparator.

### [Comparator and control circuit]

The comparator and control circuit compares an analog input voltage with the comparison voltage and stores its result into the AD conversion register. When AD conversion is completed, the control circuit sets the AD conversion completion bit and the A/D conversion interrupt request bit to “1”. Because the comparator is constructed linked to a capacitor, set  $\phi\text{SOURCE}$  in order that the A/D conversion clock is 250 kHz or over during A/D conversion.

### • Notes

As for A/D translation accuracy, on the following operating conditions, accuracy may become low.

- (1) When  $V_{CC}$  voltage is lower than [3.0 V], the accuracy at the low temperature may become extremely low compared with that at room temperature. When the system would be used at low temperature, the use at  $V_{CC} = 3.0\text{ V}$  or more is recommended.
- (2) When  $X_{CIN}$  or the low-speed on-chip oscillator is selected as  $\phi\text{SOURCE}$ , the A/D converter cannot be used.

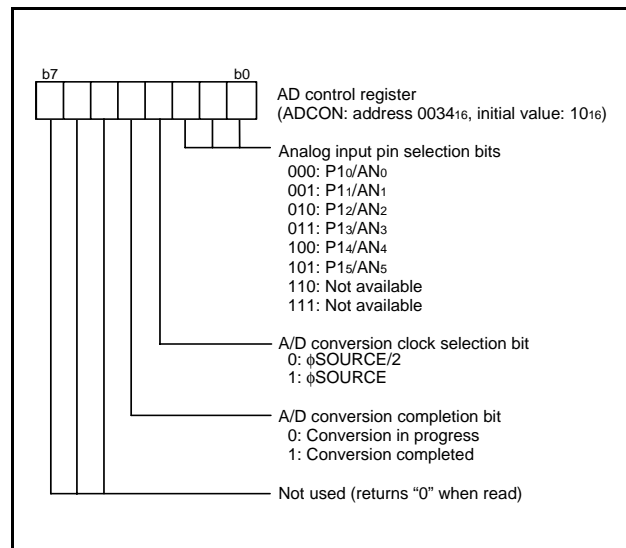

Fig 51. Structure of AD control register

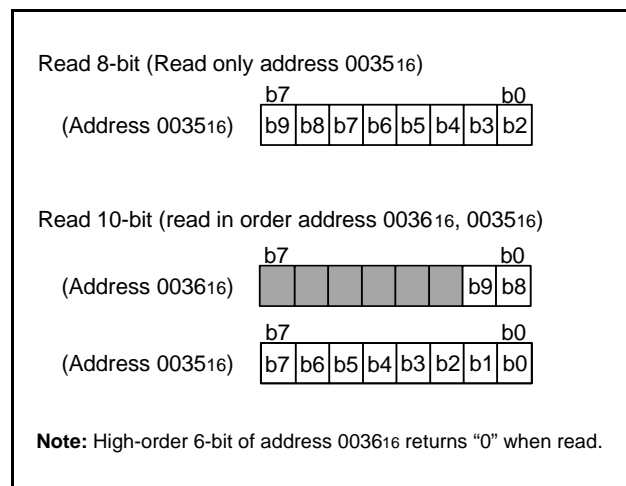

Fig 52. Structure of AD conversion register

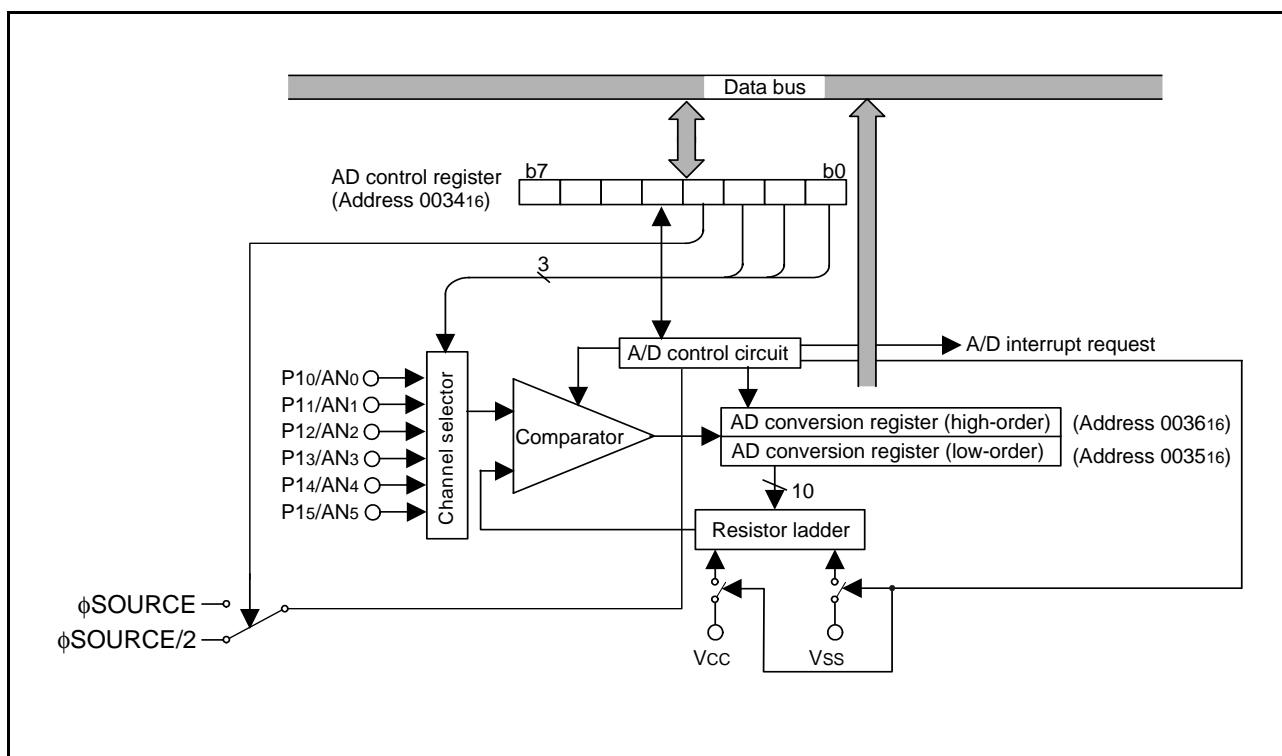

Fig 53. Block diagram of A/D converter

## Watchdog Timer

The watchdog timer gives a means for returning to a reset status when the program fails to run on its normal loop due to a runaway. The watchdog timer consists of an 8-bit watchdog timer H and an 8-bit watchdog timer L, being a 16-bit counter. The operation of the watchdog timer is controlled by bits 2 to "0" in function set ROM data 2 and the watchdog timer control register.

### • Watchdog timer disable bit

When the watchdog timer disable bit (bit 1 in function set ROM data 2(FSR0M2)) is set to "0", the watchdog timer is enabled and starts counting after reset.

Setting this bit to "1" does not operate the watchdog timer.

This bit cannot be rewritten by executing the instruction.

To use the watchdog timer, always set this bit to "0".

After reset, the watchdog timer cannot start counting by a program.

### • Watchdog timer source clock selection bit

The count source of the watchdog timer is selected by the watchdog timer source clock selection bit (bit 0 in FSR0M2). This bit cannot be rewritten by executing the instruction.

When this bit is set to "0", the count source is always set to the low-speed on-chip oscillator output/16.

When this bit is set to "1", the count source is set to  $\phi$ SOURCE/16.  $\phi$ SOURCE is changed by setting the clock selection bits (bits 5 and 4 in the clock mode register (CLKM: address 0037<sub>16</sub>)).

### • Watchdog timer H count source selection bit

The count source of watchdog timer H is selected by the watchdog timer control register (WDTCN: address 0039<sub>16</sub>).

When the watchdog timer H count source selection bit (bit 7 in WDTCN) is set to "0", the count source is set to an underflow signal from watch dog timer L. When this bit is set to "1", the clock selected as the count source of watchdog timer L is input to watchdog timer H.

The initial value of this bit after releasing reset can be set by the bit 2 in FSR0M2.

### • Watchdog Timer Operation

Resetting or writing any data to WDTCN sets watchdog timer H to "FF<sub>16</sub>" and watchdog timer L to "FF<sub>16</sub>". When the watchdog timer starts, the selected clock is counted and internal reset occurs by the watchdog timer H underflow. Writing to WDTCN is usually programmed to be performed before underflow.

Reading WDTCN reads the values of the high-order 6 bits in the watchdog timer H counter and the watch dog timer count source selection bit.

The following shows the time to watchdog timer underflow after writing to the watchdog timer control register.

The example applies when the XIN input clock is selected as  $\phi$ SOURCE and  $f(XIN) = 8\text{ MHz}$ .

- Watchdog timer H count source selection bit = 0: 131.072 ms
- Watchdog timer H count source selection bit = 1: 512  $\mu$ s

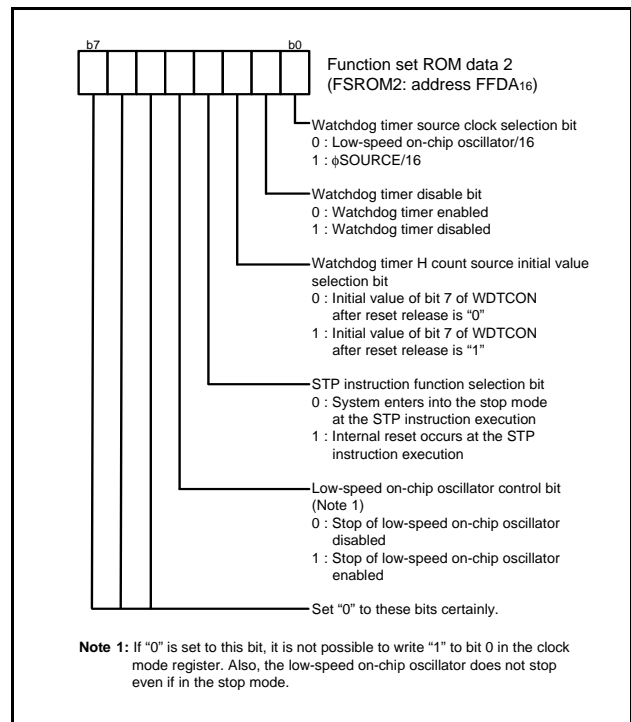

Fig 54. Structure of Function set ROM data 2

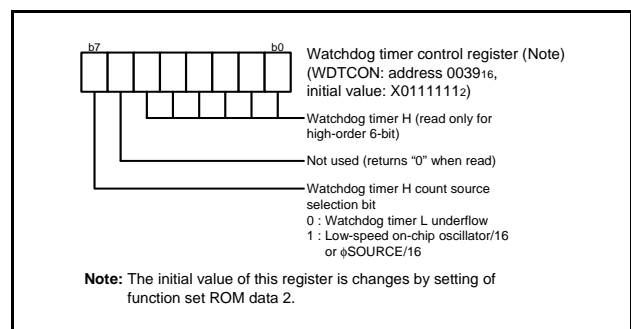

Fig 55. Structure of watchdog timer control register

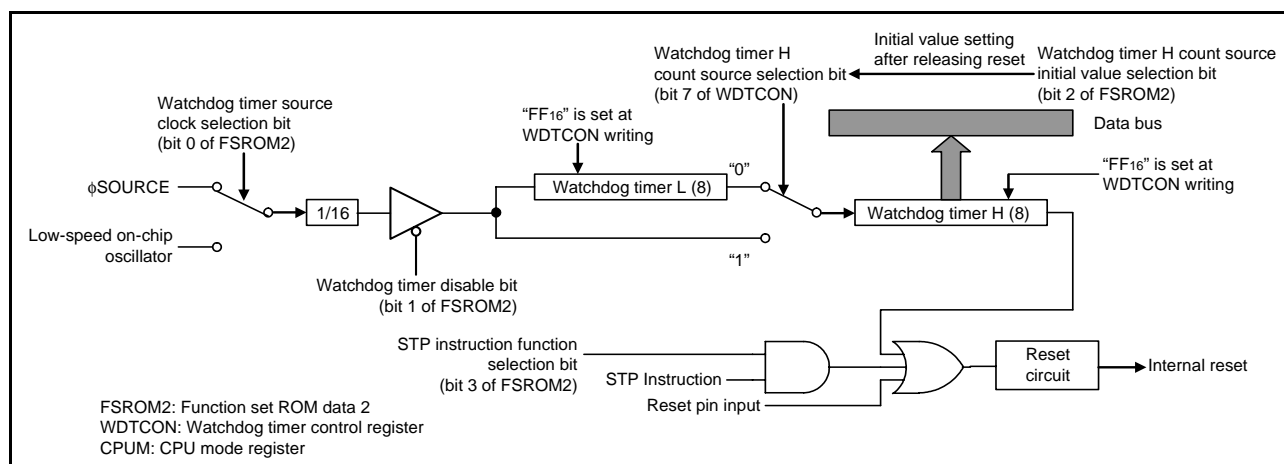

Fig 56. Block diagram of watchdog timer

#### • Notes

- (1) The watchdog timer operates in wait mode. To prevent underflow, write to the watchdog timer control register.

The watchdog timer stops in stop mode, but starts counting at the same time as exiting stop mode. After exiting stop mode, it continues counting during oscillation stabilization time. To prevent underflow during the period, the watchdog timer H count source selection bit (bit 7) in the watchdog timer control register (address 0039<sub>16</sub>) should be set to "0" before executing the STP instruction.

Note that the watchdog timer continues counting even if the STP instruction is executed in the following two conditions:

- ① Stopping the low-speed on-chip oscillator: Disabled (bit 4 in FSROM2)  
Source clock of the watchdog timer: Low-speed on-chip oscillator/16 (bit 0 in FSROM2)
- ② Stopping the low-speed on-chip oscillator: Disabled (bit 4 in FSROM2)  
Source clock of the watchdog timer: φSOURCE (bit 0 in FSROM2)  
φSOURCE: Low-speed on-chip oscillator (bits 5 and 4 in CLKM)

- (2) STP instruction function selection bit

The function of the STP instruction can be selected by the bit 2 in FSROM2. This bit cannot be used for rewriting by executing the STP instruction.

- When this bit is set to "0", stop mode is entered by executing the STP instruction.
- When this bit is set to "1", internal reset occurs by executing the STP instruction.

### Power-on Reset Circuit

Reset can be automatically performed at power on (power-on reset) by the built-in power-on reset circuit.

To use the built-in power-on reset circuit, leave the  $\overline{\text{RESET}}$  pin open (the pull-up resistor is built-in).

### Low Voltage Detection Circuit

The built-in low voltage detection circuit is designed to detect a drop in voltage and to reset the microcomputer if the power source voltage drops below a set value (Typ.1.95 V).

The low voltage detection circuit is valid by setting "1" to bit 0 of the function set ROM data 0.

Also, when "1" is set to bit 2 of the function set ROM data 1, the low voltage detection circuit can be valid even in the stop mode. The low voltage detection circuit is stopped in the stop mode by setting "0" to this bit, so that the power dissipation is reduced.

### Clock Generating Circuit

The clock generating circuit includes the XIN clock (ceramic oscillator or crystal oscillator can be used), XCIN clock (32 kHz oscillator can be used), external clock input, high-speed on-chip oscillator, and low-speed on-chip oscillator.

Pins P20/XOUT/XCOUT and P21/XIN/XCIN can be shared for the ports, XIN oscillation, and XCIN oscillation.

Use the oscillation method selection bits (bits 1 and bit 0 in function set ROM data 1 (FSROM1)) to set the function of these pins.

#### • Ceramic Resonator or Crystal Oscillator

Set the oscillation method selection bits (bits 1 and bit 0 in FSROM1) to "012", and connect the ceramic resonator (or the oscillator) and external circuit with the shortest wiring length possible.

The constants of the oscillator circuit differ depending on the resonator. Use the values recommended by the resonator manufacturer. (An external feedback resistor may be necessary under some conditions.)

Setting the XIN/XCIN oscillation control bit to "0" starts oscillation. This bit is sets to "0" after reset.

#### • 32 kHz Crystal Oscillator

Set the oscillation method selection bits to "102", and connect the 32 kHz crystal oscillator and external circuit with the shortest wiring length possible.

The constants of the oscillator circuit differ depending on the resonator. Use the values recommended by the resonator manufacturer. (An external feedback resistor may be necessary under some conditions.)

Setting the XIN/XCIN oscillation control bit to "0" starts oscillation. This bit is sets to "0" after reset.

#### • External Clock Input

Set the oscillation method selection bits to "112", and connect the clock source to the P20/XOUT pin. In this case, the P21/XIN pin can be used as an I/O port.

#### • High-Speed On-Chip Oscillator

The high-speed on-chip oscillator is stopped after reset.

Setting the high-speed on-chip oscillator oscillation control bit (bit 1 in CLKM) to "0" starts oscillation. This bit is sets to "1" after reset.

#### • Low-Speed On-Chip Oscillator

The low-speed on-chip oscillator automatically starts oscillating after reset.

Setting the low-speed on-chip oscillator oscillation control bit (bit 0 in CLKM) to "1" stops oscillation. This bit is sets to "0" after reset. If the low-speed on-chip oscillator control bit (bit 4 in FSROM2) is set to "0" and stopping the low-speed on-chip oscillator is disabled, the low-speed on-chip oscillator oscillation control bit cannot be set to "1" and oscillation cannot be stopped. Also, the oscillator does not stop even when the STP instruction is executed.

#### • Using No Oscillator Pins (P20 as output port and P21 as I/O port)

To use only an internal on-chip oscillator, set the oscillation method selection bits to "002". The P20/XOUT pin can be used as an output port and the P21/XIN pin can be used as an I/O port.

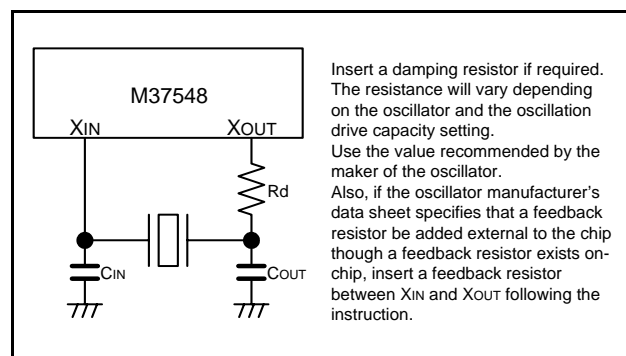

Fig 62. External circuit of ceramic resonator

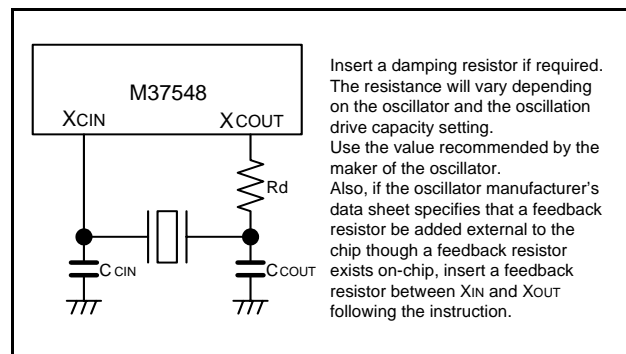

Fig 63. External circuit of 32 kHz quartz-crystal oscillator

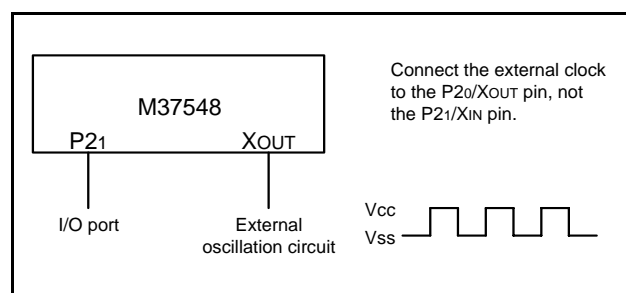

Fig 64. External clock input circuit

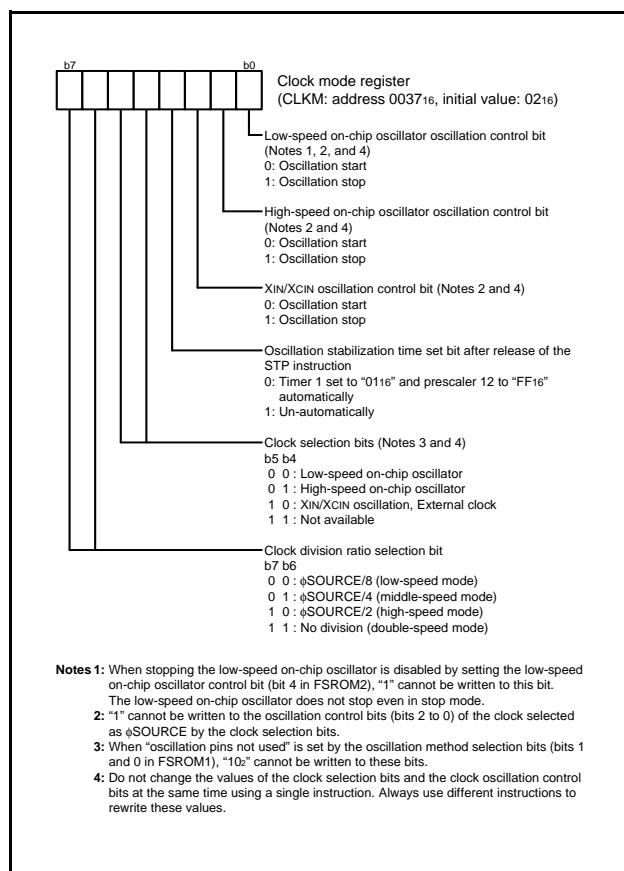

Fig 65. Structure of clock mode register

#### • Note

##### • Switching to XIN/XCIN Oscillator

After a reset is cleared, operation starts using the low-speed on-chip oscillator. When switching to XIN/XCIN oscillator, make sure to set a sufficient wait duration with the on-chip oscillator to allow the XIN/XCIN oscillator to stabilize.

## Oscillation Control

### • Clock mode register

Clock mode register contains the oscillation control bits of each oscillation circuits, clock selection bits and etc

### • Clock selection bits

$\phi$ SOURCE can be selected by the clock selection bits (bits 5 and 4 in clock mode register).  $\phi$ SOURCE can be selected from low-speed on-chip oscillator, high-speed on-chip oscillator, XIN/XCIN oscillation or external clock input by the clock selection bits.  $\phi$ SOURCE is also used to the clock for peripheral functions.

When the oscillation method selection bits (bits 1 and 0 in FSROM1) is set to "002" (oscillation pins not used), setting the clock selection bits to "102" (XIN/XCIN oscillation, external clock input) is disabled.

### • Clock division ratio selection bit

The internal clock  $\phi$  is generated by dividing  $\phi$ SOURCE.

Select the division ratio using the clock division ratio selection bits (bits 7 and 6 in CLKM).

The division ratio can be selected from among  $\phi$ SOURCE/8 (low-speed mode), /4 (middle-speed mode), /2 (high-speed mode), and no division (double-speed mode).

Table 9 shows the division ratio (mode) settings.

When releasing reset, the low-speed on-chip oscillator is selected as  $\phi$ SOURCE, and  $\phi$ SOURCE/8 is selected as the internal clock. The high-speed on-chip oscillator is stopped at this time. If an oscillation circuit is connected to the clock pin, oscillation starts. To switch  $\phi$ SOURCE to XIN/XCIN oscillation, generate wait time using the on-chip oscillator until the oscillation is stabilized.

**Table 9 Setting the clock division (mode)**

$\phi$ SOURCE	Mode bit	CLKM					FSROM1	FSROM2
		Clock division ratio selection bits	Clock selection bits	XIN/XCIN oscillation control bit	High-speed on-chip oscillator oscillation control bit	Low-speed on-chip oscillator oscillation control bit	Oscillation method selection bits	Low-speed on-chip oscillator control bit
		Bit 7, 6	Bit 5, 4	Bit 2	Bit 1	Bit 0	Bit 1, 0	Bit 4
XIN	Double-speed	11	10	0	—	—	01	—
	High-speed	10	10	0	—	—	01	—
	Middle-speed	01	10	0	—	—	01	—
	Low-speed	00	10	0	—	—	01	—
XCIN	Double-speed	11	10	0	—	—	10	—
	High-speed	10	10	0	—	—	10	—
	Middle-speed	01	10	0	—	—	10	—
	Low-speed	00	10	0	—	—	10	—
External clock	Double-speed	11	10	—	—	—	11	—
	High-speed	10	10	—	—	—	11	—
	Middle-speed	01	10	—	—	—	11	—
	Low-speed	00	10	—	—	—	11	—
High-speed on-chip oscillator	Double-speed	11	01	—	0	—	—	—
	High-speed	10	01	—	0	—	—	—
	Middle-speed	01	01	—	0	—	—	—
	Low-speed	00	01	—	0	—	—	—
Low-speed on-chip oscillator	Double-speed	11	00	—	—	0	—	1/0
	High-speed	10	00	—	—	0	—	1/0
	Middle-speed	01	00	—	—	0	—	1/0
	Low-speed	00	00	—	—	0	—	1/0

—: can be "0" or "1", no change in outcome

**• Stop mode**

When the STP instruction is executed, the internal clock  $\phi$  stops at an “H” level and the XIN/XCIN and on-chip oscillator stops. At this time, timer 1 is set to “0116” and prescaler 12 is set to “FF16” when the oscillation stabilization time set bit after release of the STP instruction is “0”. On the other hand, timer 1 and prescaler 12 are not set when the above bit is “1”. Accordingly, set the wait time fit for the oscillation stabilization time of the oscillator to be used. When an external interrupt is accepted, oscillation is restarted but the internal clock  $\phi$  remains at “H” until timer 1 underflows. As soon as timer 1 underflows, the internal clock  $\phi$  is supplied. This is because when a ceramic resonator is used, some time is required until a start of oscillation. In case oscillation is restarted by reset, no wait time is generated. So apply an “L” level to the RESET pin while oscillation becomes stable, or set the wait time by on-chip oscillator operation after system is released from reset until the oscillation is stabled.

**• Wait mode**

If the WIT instruction is executed, the internal clock  $\phi$  stops at an “H” level, but the oscillator does not stop. The internal clock restarts if a reset occurs or when an interrupt is received. Since the oscillator does not stop, normal operation can be started immediately after the clock is restarted. To ensure that interrupts will be received to release the STP or WIT state, interrupt enable bits must be set to “1” before the STP or WIT instruction is executed.

**• Note**

For use with the oscillation stabilization set bit after release of the STP instruction set to “1”, set values in timer 1 and prescaler 12 after fully appreciating the oscillation stabilization time of the oscillator to be used.

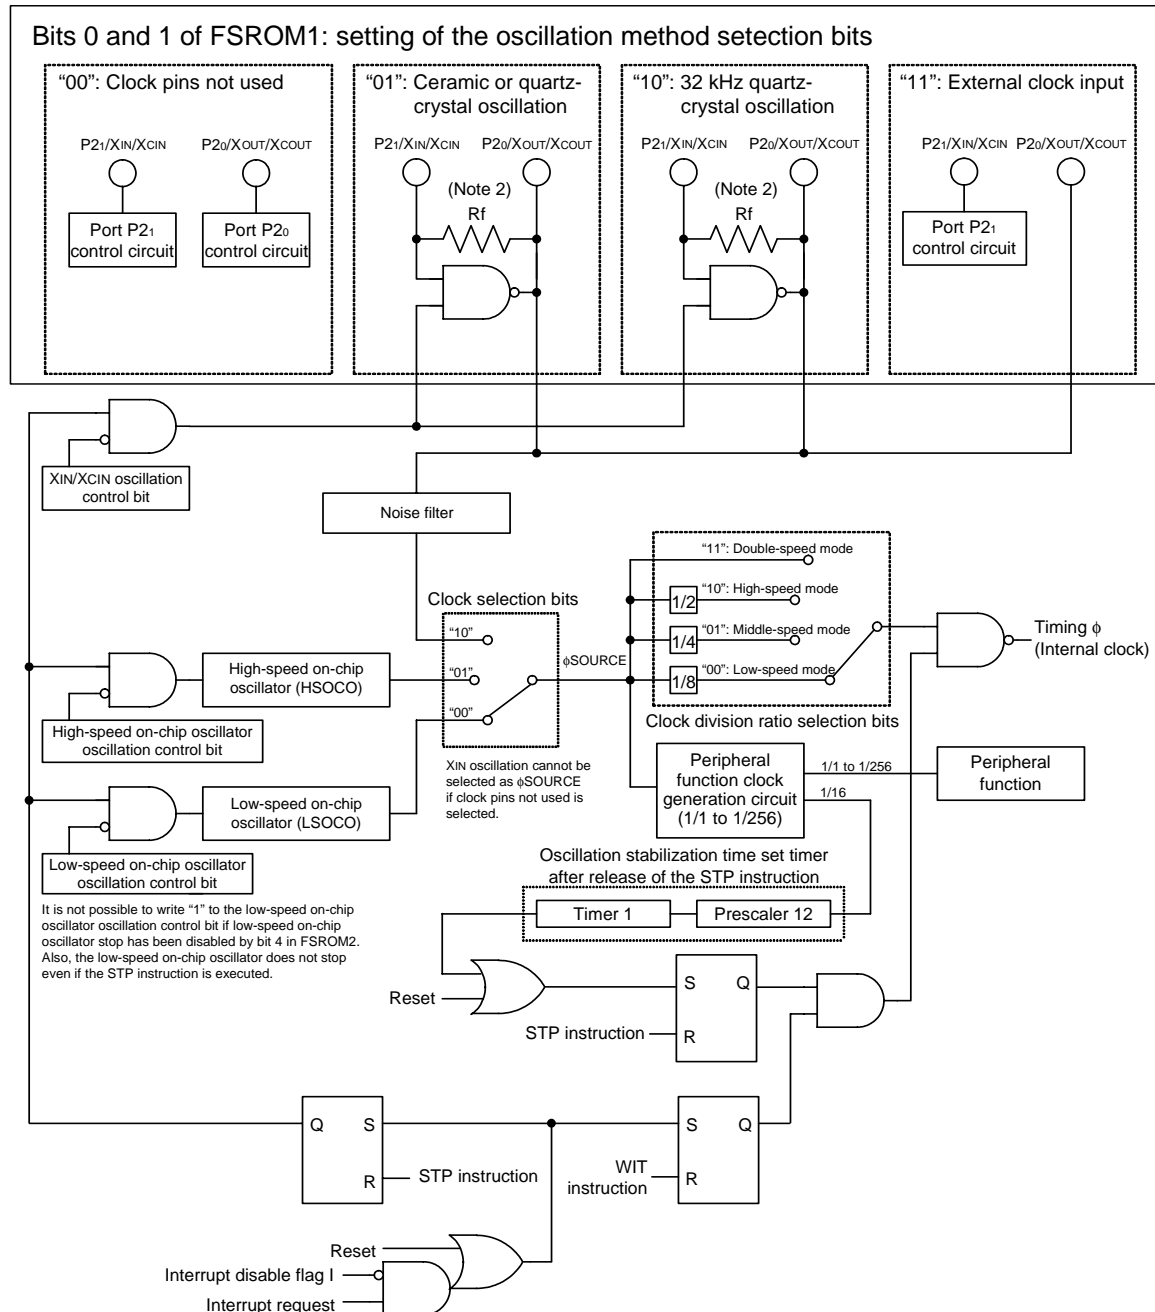

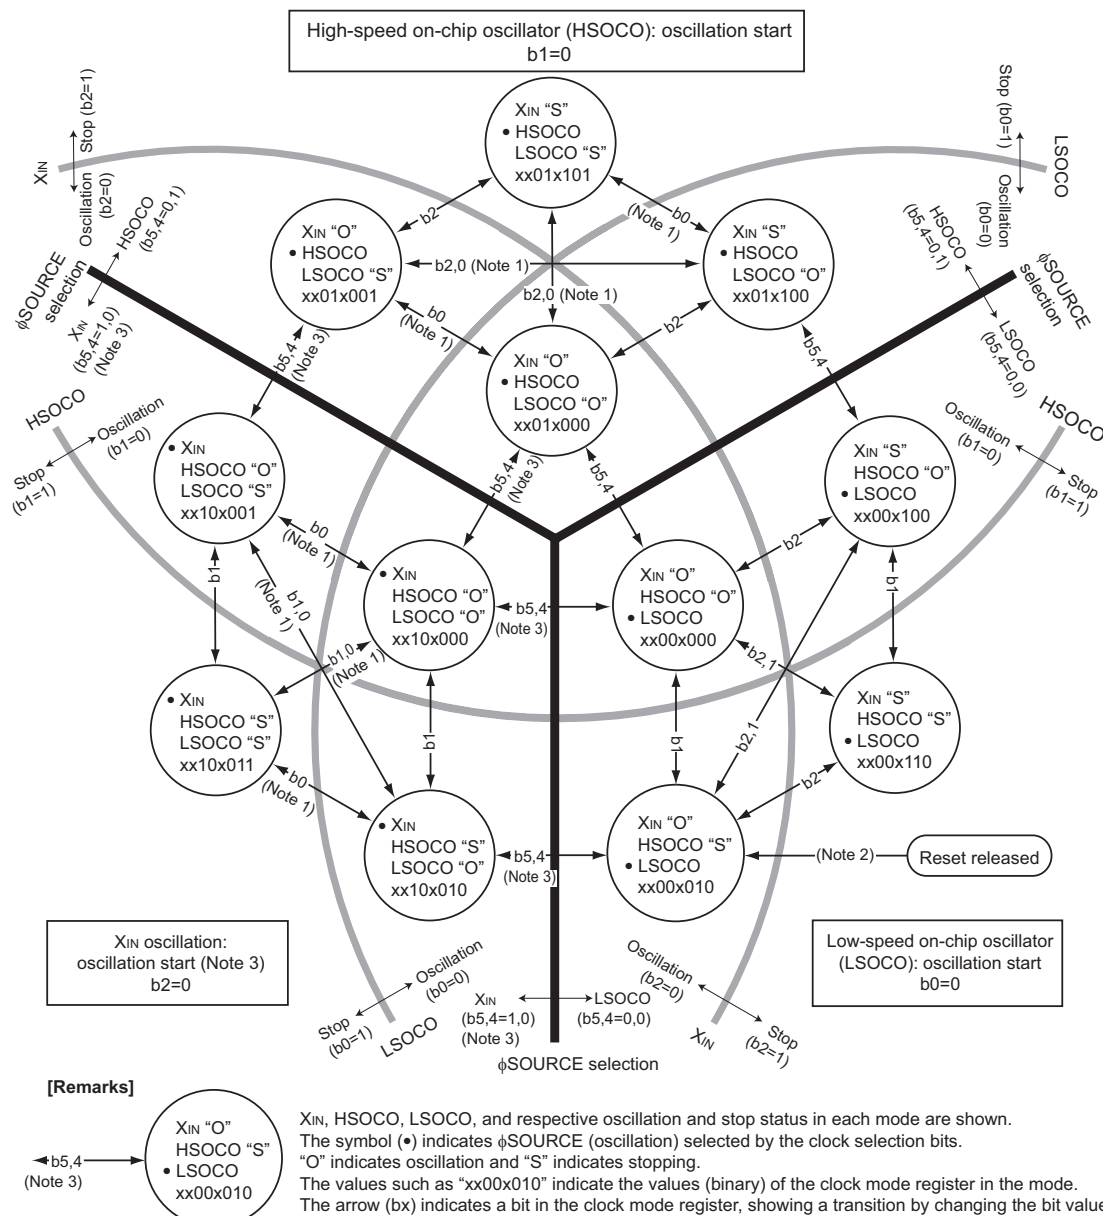

Fig 66. Block diagram of internal clock generating circuit

State transition of clock mode register CLKM (address: 0037<sub>16</sub>) setting value and clock  
(When X<sub>IN</sub> oscillation is used. The same applies when X<sub>CIN</sub> oscillation and external clock input are used.)

Entering the mode should be performed according to the arrows. Wait mode and stop mode can be entered from all modes, and the original mode is returned after exiting.

#### Wait mode

- Low-speed on-chip oscillator: Status before executing WIT instruction is kept
- High-speed on-chip oscillator: Status before executing WIT instruction is kept
- X<sub>IN</sub> oscillation: Status before executing the WIT instruction is kept

#### Stop mode

- Low-speed on-chip oscillator: Stopped (Note 1)
- High-speed on-chip oscillator: Stopped
- X<sub>IN</sub> oscillation: Stopped

- Notes 1: When stopping the low-speed on-chip oscillator is disabled by the low-speed on-chip oscillator control bit (bit 4 in FSROM2), "1" cannot be written to the bit 0 in CLKM. The low-speed on-chip oscillator does not stop even in stop mode.
- 2: After releasing reset, the low-speed on-chip oscillator is selected as  $\phi$ SOURCE and divided by 8 is selected as the CPU clock.
- 3: When the oscillation pins not used is set by the oscillation method selection bits (bits 1 and 0 in FSROM1), "10" cannot be written to bits 5 and 5 in CLKM. To use X<sub>IN</sub> oscillation as  $\phi$ SOURCE, switch after X<sub>IN</sub> oscillation is stabilized. Supply a stable clock when an external clock is used.
- 4: Do not change the values of the clock selection bits (bits 5 and 4) in CLKM and the individual clock oscillation control bits (bits 2 to 0) at the same time using a single instruction. Always use different instructions to rewrite these values.
- 5: Wait until the oscillation used in the destination mode is stabilized before entering.

Fig 67.  $\phi$ SOURCE state transition

### • Oscillation stop detection circuit

The oscillation stop detection circuit is used to detect an oscillation stop when a ceramic resonator or oscillation circuit stops due to disconnection. To use the oscillation stop detection circuit, set the low-speed on-chip oscillator to start operating.

The oscillation stop detection circuit is enabled by setting the XIN oscillation stop detection function active bit to 1. While this circuit is enabled, the operating status of the XIN oscillation circuit is monitored using the low-speed on-chip oscillator. If an oscillation stop is detected, the oscillation stop detection status bit is set to 1. If the oscillation stop detection reset enable bit is also set to 1, an internal reset is triggered at oscillation stop detection.

The XIN oscillation stop detection function active bit and the oscillation stop detection status bit are not initialized if an oscillation stop detection reset is triggered and these bits retain their value of 1. Since these bits are initialized to 0 by an external reset, an oscillation stop detection reset can be determined by checking the oscillation stop status bit.

The oscillation stop detection status bit is set to 0 by writing 0 to the XIN oscillation stop detection function enable bit.

To enable the oscillation detection circuit, first write 0 to the XIN oscillation stop detection function enable bit and set the oscillation stop detection status bit to 0. Then set the oscillation stop function to 1.

The XIN oscillation and external clock input are set as the clocks for oscillation stop detection. Refer to the electrical characteristics for the frequencies for oscillation stop detection.

### • Notes

- (1) Do not execute the transition to “state 2’a” shown in Figure 68 State transition of oscillation stop detection circuit. In this state, no reset is triggered and the MCU is stopped even when the XIN oscillation stops.
- (2) After an oscillation stop detection reset, if this reset is enabled while bits XIN oscillation stop detection function active and oscillation stop detection status are retained, a reset is triggered again.
- (3) The oscillation stop detection status bit is initialized under the following conditions:
  - External reset, power-on reset, low-voltage detection reset, watchdog timer reset, and reset by the STP instruction function.
  - Write 0 to the XIN oscillation stop detection function active bit
- (4) While the oscillation stop detection function is in active, the oscillation stop detection status bit may set to 1 when the watchdog timer underflows or by a reset when the STP instruction is executed with the STP instruction function selection bit set to 1.
 

When an oscillation stop detection reset is triggered, reconfirm that oscillation is stopped.
- (5) The oscillation stop detection circuit is not included in the emulator MCU “M37549RLSS”.

### QzROM Writing Mode

In the QzROM writing mode, the user ROM area can be written while the microcomputer is mounted on-board by using a serial programmer which is applicable for this microcomputer.

Table 10 lists the pin description (QzROM writing mode) and Figure 70 shows the pin connections.

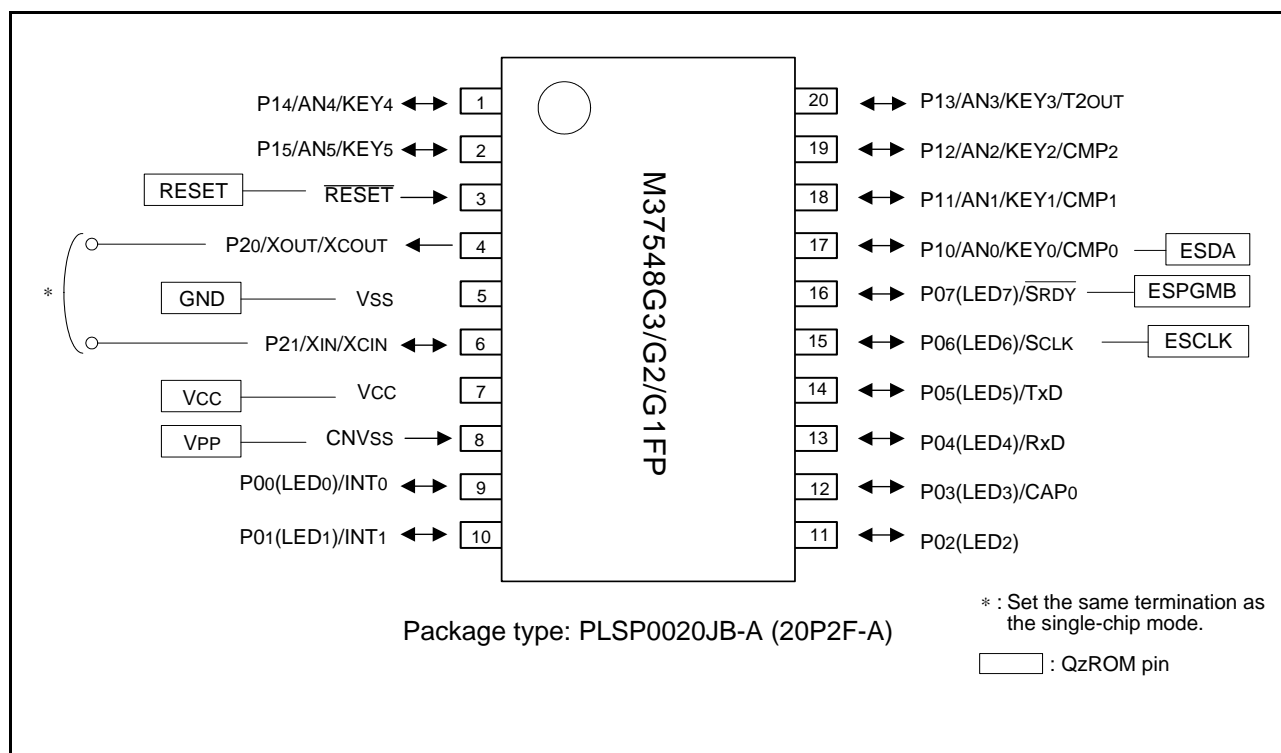

Refer to Figure 71 and Figure 72 for examples of a connection with a serial programmer.

Contact the manufacturer of your serial programmer for serial programmer.

Refer to the user's manual of your serial programmer for details on how to use it.

**Table 10 Pin description (QzROM writing mode)**

Pin	Name	I/O	Function
Vcc, Vss	Power source	Input	Apply 2.7 to 5.5 V to Vcc, and 0 V to Vss.
RESET	Reset input	Input	Reset input pin.
P21 /XIN	Clock input	Input	Set the same termination as the single-chip mode.
P20 /XOUT	Clock output	Output	
P00 – P05 P11 – P15	I/O port	I/O	Input "H" or "L" level signal or leave the pin open.
CNVss	VPP input	Input	QzROM programmable power source pin.
P10	ESDA I/O	I/O	Serial data I/O pin.
P06	ESCLK input	Input	Serial clock input pin.
P07	ESPGMB input	Input	Read/program pulse input pin.

**Fig 70. Pin connection diagram (M37548G3/G2/G1FP)**

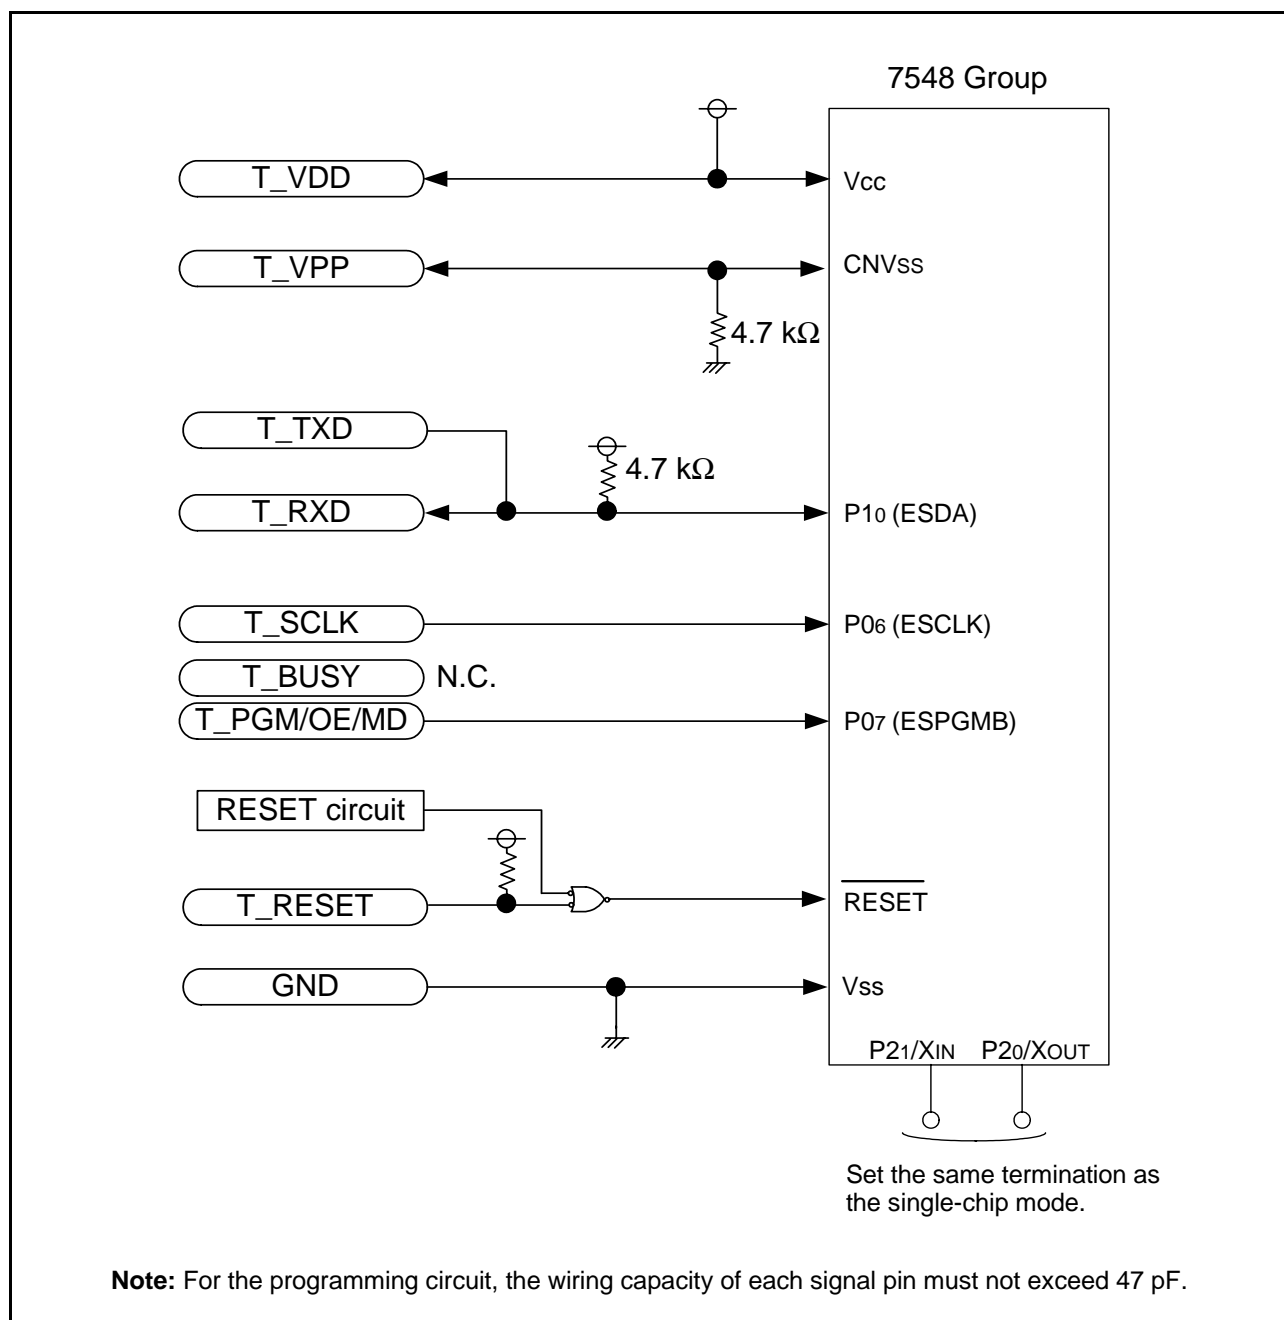

Fig 72. When using programmer of Suisai Electronics System Co., LTD, connection example

## NOTES ON PROGRAMMING

### (1) Processor Status Register

The contents of the processor status register (PS) after reset are undefined except for the interrupt disable flag I which is "1". After reset, initialize flags which affect program execution. In particular, it is essential to initialize the T flag and the D flag because of their effect on calculations.

### (2) Interrupts

The contents of the interrupt request bit do not change even if the BBC or BBS instruction is executed immediately after they are changed by program because this instruction is executed for the previous contents. For executing the instruction for the changed contents, execute one instruction before executing the BBC or BBS instruction.

### (3) Decimal Calculations

- For calculations in decimal notation, set the decimal mode flag D to "1", then execute the ADC instruction or SBC instruction. In this case, execute SEC instruction, CLC instruction or CLD instruction after executing one instruction before the ADC instruction or SBC instruction.
- In the decimal mode, the values of the N (negative), V (overflow) and Z (zero) flags are invalid.

### (4) Ports

The values of the port direction registers cannot be read. That is, it is impossible to use the LDA instruction, memory operation instruction when the T flag is "1", addressing mode using direction register values as qualifiers, and bit test instructions such as BBC and BBS.

It is also impossible to use bit operation instructions such as CLB and SEB and read/modify/write instructions of direction registers for calculations such as ROR.

For setting direction registers, use the LDM instruction, STA instruction, etc.

### (5) A/D Conversion

Do not execute the STP instruction during A/D conversion.

### (6) Instruction Execution Timing

The instruction execution time can be obtained by multiplying the frequency of the internal clock  $\phi$  by the number of cycles mentioned in the machine-language instruction table.

The frequency of the internal clock  $\phi$  is the same as that of the  $\phi$ SOURCE in double-speed mode, twice the  $\phi$ SOURCE cycle in high-speed mode, 4 times the  $\phi$ SOURCE cycle in middle-speed mode and 8 times the  $\phi$ SOURCE cycle in low-speed mode.

### (7) CPU Mode Register

The processor mode bits can be written only once after releasing reset. Always set them to "002". After written, rewriting any data to these bits is disabled because they are locked. (Emulator MCU is excluded.)

### (8) State transition

Do not stop the clock selected as the operation clock because of setting of bits 0 to 2.

## NOTES ON HARDWARE

### (1) Handling of Power Source Pin

In order to avoid a latch-up occurrence, connect a capacitor suitable for high frequencies as bypass capacitor between power source pin (VCC pin) and GND pin (VSS pin). A ceramic capacitor of 0.01  $\mu$ F to 0.1  $\mu$ F is recommended.

Connect a capacitor across the power source pin and GND pin with the shortest possible wiring.

## NOTES ON USE

### Countermeasures against noise

It is necessary not only design the system taking measures against the noise as follows but to evaluate before actual use.

#### 1. Shortest wiring length

##### (1) Package

Select the smallest possible package to make the total wiring length short.

<Reason>

The wiring length depends on a microcomputer package. Use of a small package, for example QFP and not DIP, makes the total wiring length short to reduce influence of noise.

Fig 73. Selection of packages

##### (2) Wiring for $\overline{\text{RESET}}$ pin

Make the length of wiring which is connected to the  $\overline{\text{RESET}}$  pin as short as possible. Especially, connect a capacitor across the  $\overline{\text{RESET}}$  pin and the Vss pin with the shortest possible wiring (within 20 mm).

<Reason>

The width of a pulse input into the  $\overline{\text{RESET}}$  pin is determined by the timing necessary conditions. If noise having a shorter pulse width than the standard is input to the  $\overline{\text{RESET}}$  pin, the reset is released before the internal state of the microcomputer is completely initialized. This may cause a program runaway.

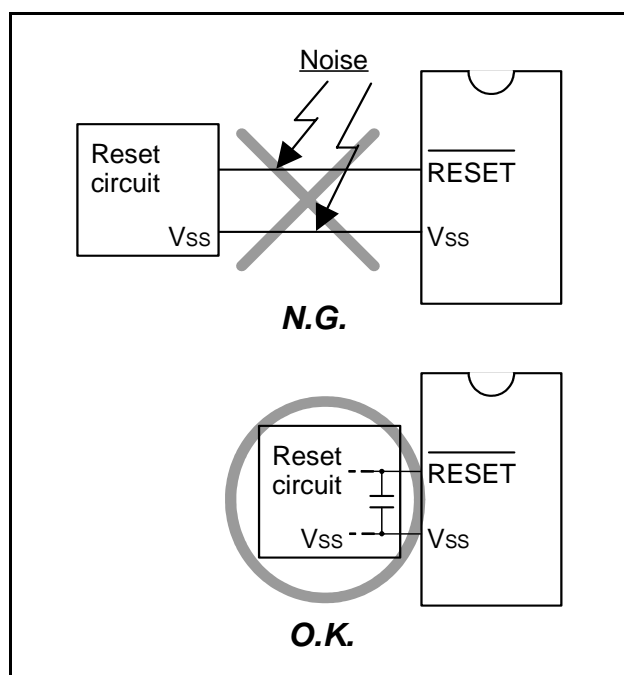

Fig 74. Wiring for the  $\overline{\text{RESET}}$  pin

##### (3) Wiring for clock input/output pins

- Make the length of wiring which is connected to clock I/O pins as short as possible.
- Make the length of wiring (within 20 mm) across the grounding lead of a capacitor which is connected to an oscillator and the Vss pin of a microcomputer as short as possible.
- Separate the Vss pattern only for oscillation from other Vss patterns.

<Reason>

If noise enters clock I/O pins, clock waveforms may be deformed. This may cause a program failure or program runaway. Also, if a potential difference is caused by the noise between the Vss level of a microcomputer and the Vss level of an oscillator, the correct clock will not be input in the microcomputer.

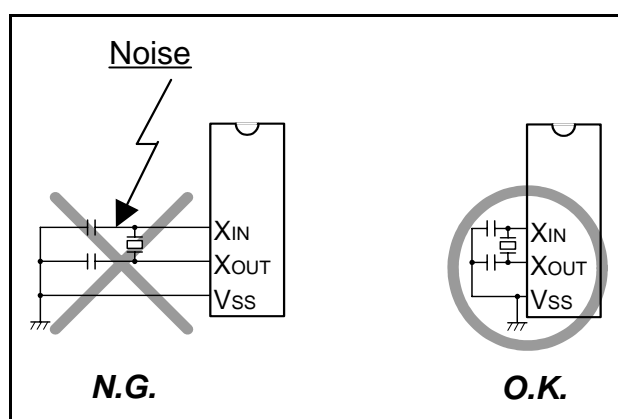

Fig 75. Wiring for clock I/O pins

##### (4) Wiring to CNVss pin

Connect CNVss pin to a GND pattern at the shortest distance. The GND pattern is required to be as close as possible to the GND supplied to Vss.

In order to improve the noise reduction, to connect a 5 kΩ resistor serially to the CNVss pin - GND line may be valid.

As well as the above-mentioned, in this case, connect to a GND pattern at the shortest distance. The GND pattern is required to be as close as possible to the GND supplied to Vss.

<Reason>

The CNVss pin of the QzROM is the power source input pin for the built-in QzROM. When programming in the built-in QzROM, the impedance of the CNVss pin is low to allow the electric current for writing flow into the QzROM. Because of this, noise can enter easily. If noise enters the CNVss pin, abnormal instruction codes or data are read from the built-in QzROM, which may cause a program runaway.

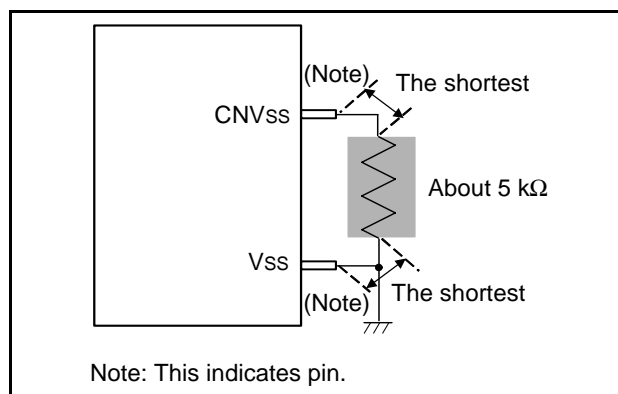

Fig 76. Wiring for the Vpp pin of the QzPROM

## 2. Connection of bypass capacitor across Vss line and Vcc line

Connect an approximately 0.1  $\mu\text{F}$  bypass capacitor across the Vss line and the VCC line as follows:

- Connect a bypass capacitor across the VSS pin and the VCC pin at equal length.
- Connect a bypass capacitor across the VSS pin and the VCC pin with the shortest possible wiring.
- Use lines with a larger diameter than other signal lines for VSS line and VCC line.
- Connect the power source wiring via a bypass capacitor to the VSS pin and the VCC pin.

Fig 77. Bypass capacitor across the Vss line and the Vcc line

## 3. Wiring to analog input pins

The analog input pin is connected to the capacitor of a voltage comparator. Accordingly, sufficient accuracy may not be obtained by the charge/discharge current at the time of A/D conversion when the analog signal source of high-impedance is connected to an analog input pin. In order to obtain the A/D conversion result stabilized more, please lower the impedance of an analog signal source, or add the smoothing capacitor to an analog input pin.

## 4. Oscillator concerns

Take care to prevent an oscillator that generates clocks for a microcomputer operation from being affected by other signals.

### (1) Keeping oscillator away from large current signal lines

Install a microcomputer (and especially an oscillator) as far as possible from signal lines where a current larger than the tolerance of current value flows.

<Reason>

In the system using a microcomputer, there are signal lines for controlling motors, LEDs, and thermal heads or others. When a large current flows through those signal lines, strong noise occurs because of mutual inductance.

### (2) Installing oscillator away from signal lines where potential levels change frequently

Install an oscillator and a connecting pattern of an oscillator away from signal lines where potential levels change frequently. Also, do not cross such signal lines over the clock lines or the signal lines which are sensitive to noise.

<Reason>

Signal lines where potential levels change frequently (such as the CNTR pin signal line) may affect other lines at signal rising edge or falling edge. If such lines cross over a clock line, clock waveforms may be deformed, which causes a microcomputer failure or a program runaway.

Fig 78. Wiring for a large current signal line/Writing of signal lines where potential levels change frequently

### (3) Oscillator protection using Vss pattern

As for a two-sided printed circuit board, print a Vss pattern on the underside (soldering side) of the position (on the component side) where an oscillator is mounted.

Connect the Vss pattern to the microcomputer Vss pin with the shortest possible wiring. Besides, separate this Vss pattern from other Vss patterns.

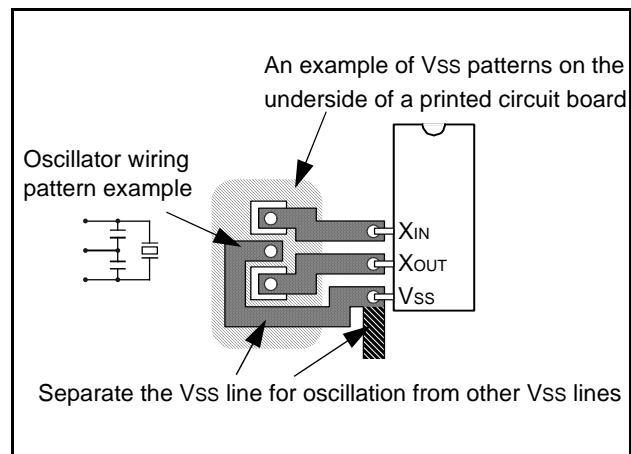

Fig 79. Vss pattern on the underside of an oscillator

## 5. Setup for I/O ports

Setup I/O ports using hardware and software as follows:

### <Hardware>

- Connect a resistor of 100  $\Omega$  or more to an I/O port in series.

### <Software>

- As for an input port, read data several times by a program for checking whether input levels are equal or not.
- As for an output port, since the output data may reverse because of noise, rewrite data to its port latch at fixed periods.
- Rewrite data to direction registers and pull-up control registers at fixed periods.

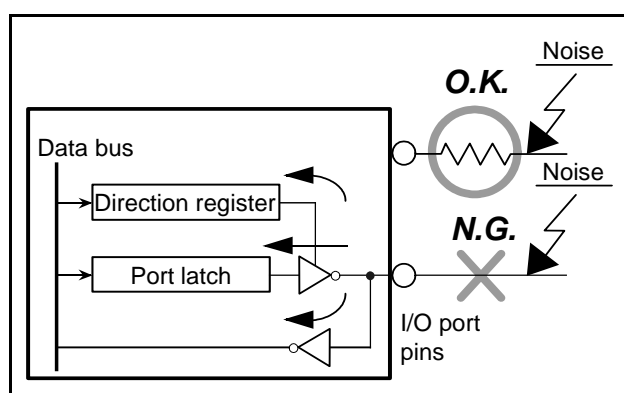

Fig 80. Setup for I/O ports

## 6. Providing of watchdog timer function by software

If a microcomputer runs away because of noise or others, it can be detected by a software watchdog timer and the microcomputer can be reset to normal operation. This is equal to or more effective than program runaway detection by a hardware watchdog timer. The following shows an example of a watchdog timer provided by software.

In the following example, to reset a microcomputer to normal operation, the main routine detects errors of the interrupt processing routine and the interrupt processing routine detects errors of the main routine.

This example assumes that interrupt processing is repeated multiple times in a single main routine processing.

### <The main routine>

- Assigns a single byte of RAM to a software watchdog timer (SWDT) and writes the initial value N in the SWDT once at each execution of the main routine. The initial value N should satisfy the following condition:  

$$N + 1 \geq (\text{Counts of interrupt processing executed in each main routine})$$
 As the main routine execution cycle may change because of an interrupt processing or others, the initial value N should have a margin.
- Watches the operation of the interrupt processing routine by comparing the SWDT contents with counts of interrupt processing after the initial value N has been set.
- Detects that the interrupt processing routine has failed and determines to branch to the program initialization routine for recovery processing in the following case:  
 If the SWDT contents do not change after interrupt processing.

### <The interrupt processing routine>

- Decrements the SWDT contents by 1 at each interrupt processing.
- Determines that the main routine operates normally when the SWDT contents are reset to the initial value N at almost fixed cycles (at the fixed interrupt processing count).
- Detects that the main routine has failed and determines to branch to the program initialization routine for recovery processing in the following case:  
 If the SWDT contents are not initialized to the initial value N but continued to decrement and if they reach 0 or less.

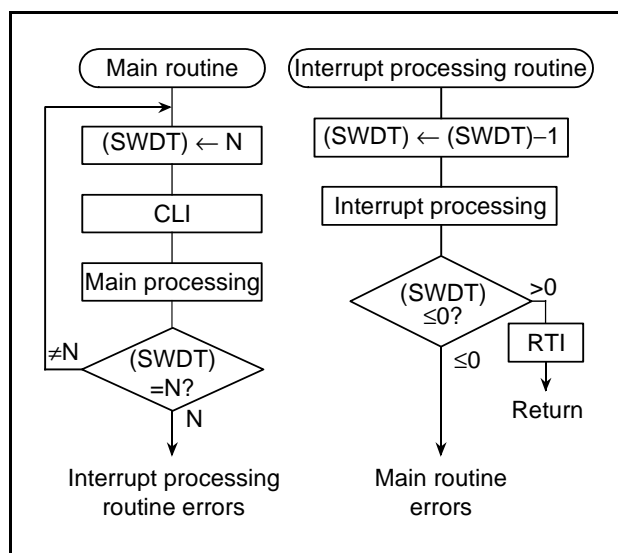

Fig 81. Watchdog timer by software

## NOTES ON USE

### Note on Power Source Voltage

When the power source voltage value of a microcomputer is less than the value which is indicated as the recommended operating conditions, the microcomputer does not operate normally and may perform unstable operation.

In a system where the power source voltage drops slowly when the power source voltage drops or the power supply is turned off, reset a microcomputer when the supply voltage is less than the recommended operating conditions and design a system not to cause errors to the system by this unstable operation.

### Product shipped in blank

As for the product shipped in blank, Renesas does not perform the writing test to user ROM area after the assembly process though the QzROM writing test is performed enough before the assembly process. Therefore, a writing error of approx.0.1 % may occur.

Moreover, please note the contact of cables and foreign bodies on a socket, etc. because a writing environment may cause some writing errors.

### Overvoltage

Take care not to apply the voltage above the V<sub>CC</sub> pin voltage to other pins. Make sure that the voltage of the CNV<sub>SS</sub> pin (V<sub>PP</sub> power input pin for QzROM) does not change as shown in the bold-lined periods (Figure 82) when powering on and off. If the voltage changes as shown, the QzROM contents may be rewritten.

Fig 82. Timing Diagram (bold-lined periods are applicable)

## NOTES ON QzROM

### Notes On QzROM Writing Orders

When ordering the QzROM product shipped after writing, submit the mask file (extension: .mask) which is made by the mask file converter MM.

Be sure to set the ROM option ("MASK option" written in the mask file converter) setup when making the mask file by using the mask file converter MM.

## Notes On ROM Code Protect

### (QzROM product shipped after writing)

As for the QzROM product shipped after writing, the ROM code protect is specified according to the ROM option setup data in the mask file which is submitted at ordering.

Renesas Technology corp. write the value of the ROM option setup data in the ROM code protect address (address FFDB16) when writing to the QzROM. As a result, in the contents of the ROM code protect address the ordered value may differ from the actual written value.

The ROM option setup data in the mask file is "0016" for protect enabled or "FF16" for protect disabled. Therefore, the contents of the ROM code protect address (other than the user ROM area) of the QzROM product shipped after writing is "0016" or "FF16".

Note that the mask file which has nothing at the ROM option data or has the data other than "0016" and "FF16" can not be accepted.

## DATA REQUIRED FOR QzROM WRITING ORDERS

The following are necessary when ordering a QzROM product shipped after writing:

1. QzROM Writing Confirmation Form\*
2. Mark Specification Form\*
3. ROM data ..... Mask file

\* For the QzROM writing confirmation form and the mark specification form, refer to the "Renesas Technology Corp." Homepage (<http://www.renesas.com/homepage.jsp>).

Note that we cannot deal with special font marking (customer's trademark etc.) in QzROM microcomputer.

**ELECTRICAL CHARACTERISTICS of 7548 Group****(1) Absolute Maximum Ratings****Table 11 Absolute maximum ratings**

Symbol	Parameter	Conditions	Ratings	Unit
V <sub>CC</sub>	Power source voltage	All voltages are based on V <sub>SS</sub> . When an input voltage is measured, output transistors are cut off.	−0.3 to 6.5	V
V <sub>I</sub>	Input voltage P00–P07, P10–P15, P20, P21		−0.3 to V <sub>CC</sub> + 0.3	V
V <sub>I</sub>	Input voltage $\overline{\text{RESET}}$		−0.3 to V <sub>CC</sub> + 0.3	V
V <sub>I</sub>	Input voltage CNV <sub>SS</sub>		−0.3 to V <sub>CC</sub> + 0.3	V
V <sub>O</sub>	Output voltage P00–P07, P10–P15, P20, P21		−0.3 to V <sub>CC</sub> + 0.3	V
P <sub>d</sub>	Power dissipation	T <sub>a</sub> = 25 °C	300	mW
T <sub>opr</sub>	Operating temperature	–	−20 to 85	°C
T <sub>stg</sub>	Storage temperature	–	−40 to 125	°C

**(2) Recommended Operating Conditions****Table 12 Recommended operating conditions (1)**(V<sub>CC</sub> = 1.8 to 5.5 V, V<sub>SS</sub> = 0 V, T<sub>a</sub> = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter				Limits			Unit
					Min.	Typ.	Max.	
VCC	Power source voltage	High-speed on-chip oscillator	Double-, high-, middle-, low-speed mode		4.0	5.0	5.5	V
		Low-speed on-chip oscillator	Double-, high-, middle-, low-speed mode		1.8	5.0	5.5	V
		XIN oscillation, XCIN oscillation, external clock input	Double-speed mode	$f(XIN) \leq 8\text{ MHz}$	4.5	5.0	5.5	V
				$f(XIN) \leq 2\text{ MHz}$	2.4	5.0	5.5	V
				$f(XIN) \leq 1\text{ MHz}$	2.2	5.0	5.5	V
			High-, middle-, low-speed mode	$f(XIN) \leq 8\text{ MHz}$	4.0	5.0	5.5	V
				$f(XIN) \leq 4\text{ MHz}$	2.4	5.0	5.5	V
				$f(XIN) \leq 1\text{ MHz}$	1.8	5.0	5.5	V
		XCIN oscillation	Double-, high-, middle-, low-speed mode	$f(XCIN) \leq 50\text{ kHz}$	1.8	5.0	5.5	V
VSS	Power source voltage					0		V
VIH	“H” input voltage (Note 4) P00–P07, P10–P15, P21				0.8VCC		VCC	V
VIH	“H” input voltage (Note 5) RESET, XIN, XCIN				0.8VCC		VCC	V
VIL	“L” input voltage (Note 4) P00–P07, P10–P15, P21				0		0.2VCC	V
VIL	“L” input voltage RESET, CNVSS				0		0.2VCC	V
VIL	“L” input voltage (Note 5) XIN, XCIN				0		0.16VCC	V
ΣIOH(peak)	“H” total peak output current (Notes 1, 4) P00–P07, P10–P15, P20, P21						–60	mA
ΣIOL(peak)	“L” total peak output current (Note 1) P00–P07						60	mA
ΣIOL(peak)	“L” total peak output current (Notes 1, 4) P10–P15, P20, P21						60	mA
ΣIOH(avg)	“H” total average output current (Notes 1, 4) P00–P07, P10–P15, P20, P21						–30	mA
ΣIOL(avg)	“L” total average output current (Note 1) P00–P07						30	mA
ΣIOL(avg)	“L” total average output current (Notes 1, 4) P10–P15, P20, P21						30	mA
IOH(peak)	“H” peak output current (Notes 2, 4) P00–P07, P10–P15, P20, P21						–10	mA
IOL(peak)	“L” peak output current (Notes 2, 4) P00–P07 (drive capacity: weakness), P10–P15, P20, P21						10	mA
IOL(peak)	“L” peak output current (Note 2) P00–P07 (drive capacity: strength)						30	mA
IOH(avg)	“H” average output current (Notes 3, 4) P00–P07, P10–P15, P20, P21						–5	mA
IOL(avg)	“L” average output current (Notes 3, 4) P00–P07 (drive capacity: weakness), P10–P15, P20, P21						5	mA
IOL(avg)	“L” average output current (Notes 3) P00–P07 (drive capacity: strength)						15	mA

**NOTES:**

1. The total output current is the sum of all the currents flowing through all the applicable ports. The total average current is an average value measured over 100 ms. The total peak current is the peak value of all the currents.
2. The peak output current is the peak current flowing in each port.
3. The average output current IOL (avg), IOH (avg) in an average value measured over 100 ms.
4. P20 and P21 indicates these pins are used as I/O ports.
5. XIN and XCIN indicates these pins are used as clock pins.

**Table 13 Recommended operating conditions (2)**(V<sub>CC</sub> = 1.8 to 5.5 V, V<sub>SS</sub> = 0 V, T<sub>a</sub> = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter				Limits			Unit

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
V <sub>CC</sub>	Power source voltage	T <sub>a</sub> = –20–85 °C	2.7		5.5	V
$\phi$ (AD)	A/D conversion clock frequency (Note)	4.0 ≤ V <sub>CC</sub> ≤ 5.5 V	0.016		8	MHz
		2.7 ≤ V <sub>CC</sub> < 4.0 V	0.016		4	MHz

**NOTE:**

1. When X<sub>CIN</sub> or the low-speed on-chip oscillator is selected as  $\phi$ SOURCE, the A/D converter cannot be used.

**(5) Power-on reset circuit characteristics****Table 18 Power-on reset circuit characteristics**(V<sub>CC</sub> = 1.8 to 5.5 V, V<sub>SS</sub> = 0 V, T<sub>a</sub> = –20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
VPOR	Valid start voltage of power-on reset circuit (Note)				0	V
TW(VPOR)	VPOR hold time				10	s
TW(VPOR-VDET)	Rising time of valid power source of power-on reset circuit	TW(VPOR) > 10 s			20	ms

**NOTE:**

1. VPOR is the start voltage level of V<sub>CC</sub> for the built-in power-on reset circuit to operate normally.  
Keep VPOR to be lower than the V<sub>CC</sub> voltage before rising of the V<sub>CC</sub> power source to use the built-in power-on reset circuit.  
Set the built-in low voltage detection circuit to be valid when the built-in power-on reset is used.

**Table 19 Low voltage detection circuit characteristics**

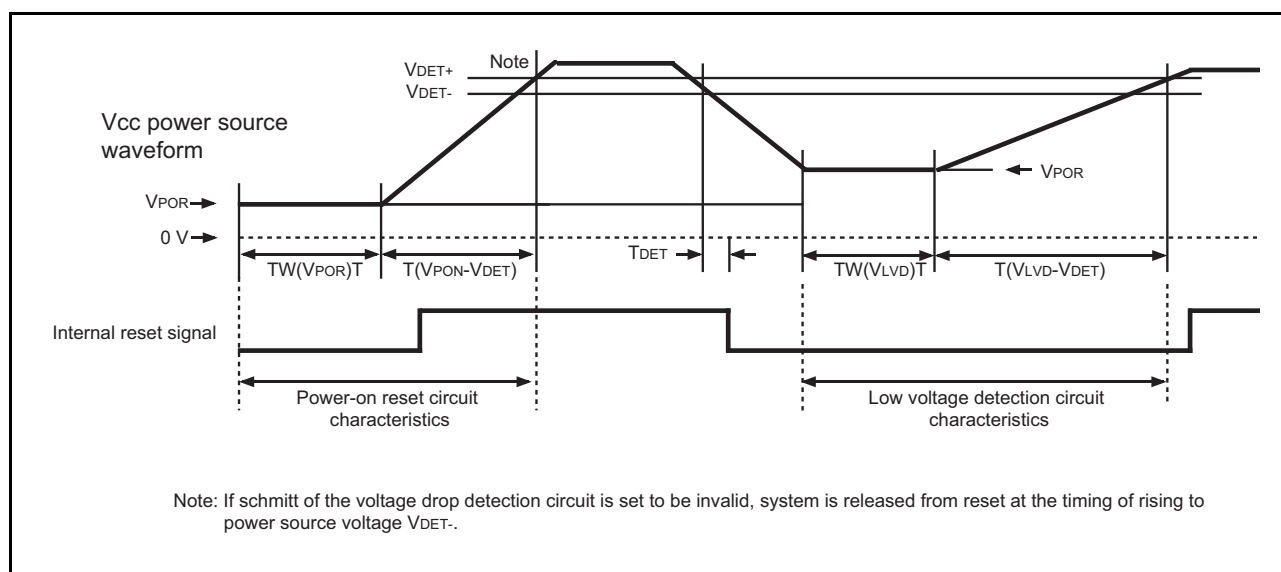

Low voltage detection circuit characteristics

(V<sub>CC</sub> = 1.8 to 5.5 V, V<sub>SS</sub> = 0 V, T<sub>a</sub> = –20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
VLVD	Valid start voltage of low voltage detection circuit (Note)		1.0			V
TW(VLVD)	VLVD hold time				10	s
TW(VLVD-VDET)	Rising time of valid power source of low voltage detection circuit	TW(VLVD) > 10 s			10	s
VDET-	Detection voltage of low voltage detection circuit	T <sub>a</sub> = 0–50 °C	1.85	1.95	2.05	V
		T <sub>a</sub> = –20–85 °C	1.80	1.95	2.10	V
V(VDET+ - VDET-)	Detection voltage Hysteresis (when hysteresis is valid)	T <sub>a</sub> = –20–85 °C		0.10		V
TDET	Detection time of low 5voltage detection circuit			20		μs

**NOTE:**

1. VLVD is the start voltage level of V<sub>CC</sub> for the built-in low voltage detection circuit to operate normally.  
If the V<sub>CC</sub> power source becomes lower than VLVD, first set the V<sub>CC</sub> voltage to be lower than VPOR. Next, according to the electrical characteristics of the power-on reset circuit, perform the rising of V<sub>CC</sub>.

**Fig 84. Electrical characteristics of power-on reset circuit and voltage drop detection circuit**

**(6) Timing Requirements****Table 20 Timing requirements (1)**(V<sub>CC</sub> = 4.0 to 5.5 V, V<sub>SS</sub> = 0 V, T<sub>a</sub> = –20 to 85 °C, unless otherwise noted)

## PACKAGE OUTLINE

## APPENDIX

### Note on Programming

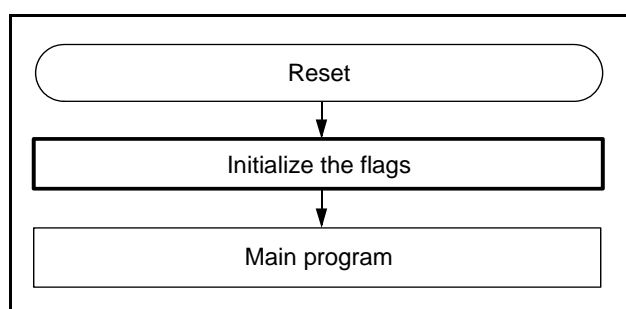

#### 1. Processor Status Register

##### (1) Initialization of the processor status register

It is required to initialize the processor status register (PS) flags which affect program execution. It is particularly essential to initialize the T and D flags because of their effect on calculations. Initialize these flags at the beginning of the program.

<Reason>

At a reset, the contents of the processor status register (PS) are undefined except for the I flag which is "1".

**Fig. 87 Initialization of processor status register flags**

##### (2) How to refer the processor status register

To refer the contents of the processor status register (PS), execute the PHP instruction once and then read the contents of (S+1). If necessary, execute the PLP instruction to return the stored PS to its original status.

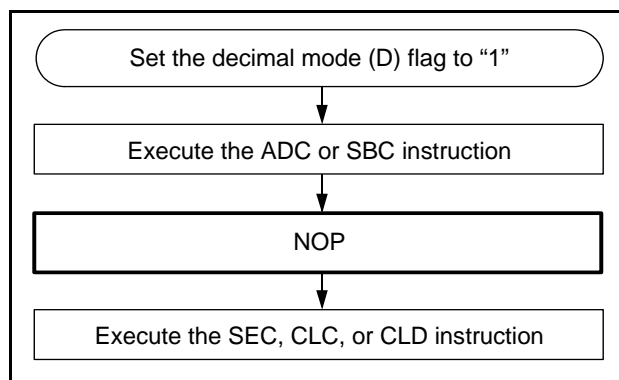

**Fig 88. Stack memory contents after PHP instruction execution**

#### 2. Decimal Calculations

##### (1) Instructions for decimal calculations

To perform decimal calculations, set the decimal mode (D) flag to "1" with the SED instruction and execute the ADC or SBC instruction. In that case, after the ADC or SBC instruction, execute another instruction before the SEC, CLC, or CLD instruction.

**Fig 89. Instructions for decimal calculations**

##### (2) Status flag at decimal calculations

When the ADC or SBC instruction is executed in decimal mode (D flag = "1"), three of the status flags (N, V, and Z) are disabled.

The carry (C) flag is set to "1" if a carry is generated and is cleared to "0" if a borrow is generated as a result of a calculation, so it can be used to determine whether the calculation has generated a carry or borrow.

Initialize the C flag before each calculation.

#### 3. JMP Instruction

When using the JMP instruction (indirect addressing mode), do not specify the address where "FF16" is allocated to the low-order 8 bits as the operand.

#### 4. Multiplication and Division Instructions

(1) The MUL and DIV instructions are not affected by the T and D flags.

(2) Executing these instructions does not change the contents of the processor status register.

## 5. Read-Modify-Write Instruction

Do not execute any read-modify-write instruction to the read invalid (address) SFR.

The read-modify-write instruction reads 1-byte of data from memory, modifies the data, and writes 1-byte the data to the original memory.

In the 740 Family, the read-modify-write instructions are the following:

- (1) Bit handling instructions:  
CLB, SEB
- (2) Shift and rotate instructions:  
ASL, LSR, ROL, ROR, RRF
- (3) Add and subtract instructions:  
DEC, INC
- (4) Logical operation instructions (1's complement):  
COM

Although not the read-modify-write instructions, add and subtract/logical operation instructions (ADC, SBC, AND, EOR, and ORA) when T flag = "1" operate in the way as the read-modify-write instruction. Do not execute them to the read invalid SFR.

<Reason>

When the read-modify-write instruction is executed to the read invalid SFR, the following may result:

As reading is invalid, the read value is undefined. The instruction modifies this undefined value and writes it back, so the written value will be indeterminate.

## Notes on Peripheral Functions

### Notes on I/O Ports

#### 1. Port direction register

- Set bits 6 and 7 of port P2 direction register to "1".
- Set bits 0 and 1 of port P3 direction register to "1".

#### 2. Pull-up control register

When using each port which built in pull-up resistor as an output port, the pull-up control bit of corresponding port becomes invalid, and pull-up resistor is not connected.

<Reason>

Pull-up control is effective only when each direction register is set to the input mode.

#### 3. Use in Stand-By State

When using the MCU in stand-by state\*<sup>1</sup> for low-power consumption, do not leave the input level of an I/O port undefined. Be especially careful to the I/O ports for the N-channel open-drain.

In this case, pull-up (connect to Vcc) or pull-down (connect to Vss) these ports through a resistor.

When determining a resistance value, note the following:

- External circuit
- Variation in the output level during ordinary operation

When using a built-in pull-up resistor, note variations in current values:

- When setting as an input port: Fix the input level
- When setting as an output port: Prevent current from flowing out externally.

<Reason>

Even if a port is set to output by the direction register, when the content of the port latch is "1", the transistor becomes the OFF state, which allows the port to be in the high-impedance state. This may cause the level to be undefined depending on external circuits.

As described above, if the input level of an I/O port is left undefined, the power source current may flow because the potential applied to the input buffer in the MCU will be unstable.

\*<sup>1</sup> Stand-by state: Stop mode by executing the STP instruction  
Wait mode by executing the WIT instruction

#### 4. Modifying Output Data with Bit Handling Instruction

When the port latch of an I/O port is modified with the bit handling instruction\*1, the value of an unspecified bit may change.

<Reason>

I/O ports can be set to input mode or output mode in byte units.

When the port register is read or written, the following will be operated:

- Port as input mode
  - Read: Read the pin level
  - Write: Write to the port latch
- Port as output mode
  - Read: Read the port latch or peripheral function output (specifications vary depending on the port)
  - Write: Write to the port latch (output the content of the port latch from the pin)

Meanwhile, the bit handling instructions are the read-modify-write instructions\*2. Executing the bit handling instruction to the port register allows reading and writing a bit unspecified with the instruction at the same time.

If an unspecified bit is set to input mode, the pin level is read and the value is written to the port latch. At this time, if the original content of the port latch and the pin level do not match, the content of the port latch changes.

If an unspecified bit is set to output mode, the port latch is normally read, but the peripheral function output is read in some ports and the value is written to the port latch. At this time, if the original content of the port latch and the peripheral function output do not match, the content of the port latch changes.

\*1 Bit handling instructions: CLB, SEB

\*2 Read-modify-write instruction: Reads 1-byte of data from memory, modifies the data, and writes 1-byte of the data to the original memory.

#### 5. Direction Registers

The values of the port direction registers cannot be read. This means, it is impossible to use the LDA instruction, memory operation instruction when the T flag is "1", addressing mode using direction register values as qualifiers, and bit test instructions such as BBC and BBS. It is also impossible to use bit operation instructions such as CLB and SEB, and read-modify-write instructions to direction registers, including calculations such as ROR. To set the direction registers, use instructions such as LDM or STA.

#### Termination of Unused Pins

##### 1. Terminate unused pins

Perform the following wiring at the shortest possible distance (20 mm or less) from microcomputer pins.

###### (1) I/O ports

Set the I/O ports for the input mode and connect each pin to VCC or VSS through each resistor of 1 kΩ to 10 kΩ. The port which can select a built-in pull-up resistor can also use the built-in pull-up resistor.

When using the I/O ports as the output mode, open them at "L" or "H".

- When opening them in the output mode, the input mode of the initial status remains until the mode of the ports is switched over to the output mode by the program after reset. Thus, the potential at these pins is undefined and the power source current may increase in the input mode. With regard to an effects on the system, thoroughly perform system evaluation on the user side.
- Since the direction register setup may be changed because of a program runaway or noise, set direction registers by program periodically to increase the reliability of program.

##### 2. Termination remarks

###### (1) I/O ports setting as input mode

[1] Do not open in the input mode.

<Reason>

- The power source current may increase depending on the first stage circuit.
- An effect due to noise may be easily produced as compared with proper termination (1) shown on the above "1. Terminate unused pins".

[2] Do not connect to VCC or VSS directly.

<Reason>

If the direction register setup changes for the output mode because of a program runaway or noise, a short circuit may occur.

[3] Do not connect multiple ports in a lump to VCC or VSS through a resistor.

<Reason>

If the direction register setup changes for the output mode because of a program runaway or noise, a short circuit may occur between ports.

## Notes on Interrupts

### 1. Change of relevant register settings

1. Change of relevant register settings

When not requiring for the interrupt occurrence synchronous with the following case, take the sequence shown in Figure 5.

- When switching external interrupt active edge
- When switching interrupt sources of an interrupt vector address where two or more interrupt sources are allocated

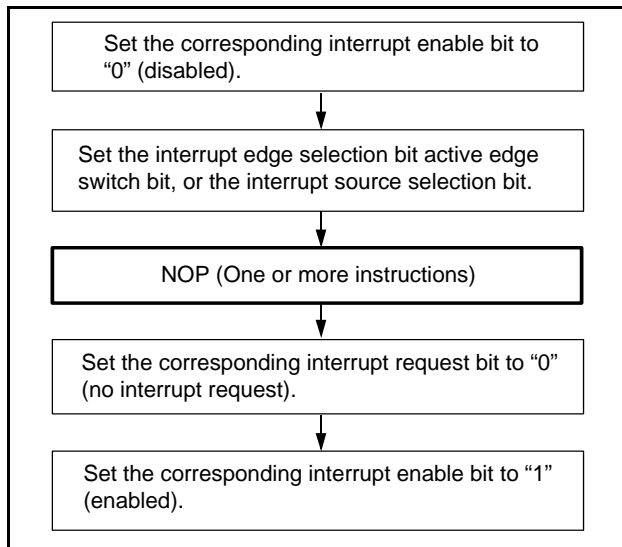

Fig 90. Sequence of changing relevant register

<Reason>

When setting the followings, the interrupt request bit of the corresponding interrupt may be set to "1".

- When switching external interrupt active edge  
INT0 interrupt edge selection bit  
(bit 0 of Interrupt edge selection register (address 003A16))
- INT1 interrupt edge selection bit  
(bit 1 of Interrupt edge selection register)
- Capture 0 interrupt edge selection bit  
(bits 1 and 0 of capture mode register (address 3216))
- Capture 1 interrupt edge selection bit  
(bits 3 and 2 of capture mode register)

### 2. Check of interrupt request bit

When executing the BBC or BBS instruction to determine an interrupt request bit immediately after this bit is set to "0", take the following sequence.

<Reason>

If the BBC or BBS instruction is executed immediately after an interrupt request bit is cleared to "0", the value of the interrupt request bit before being cleared to "0" is read.

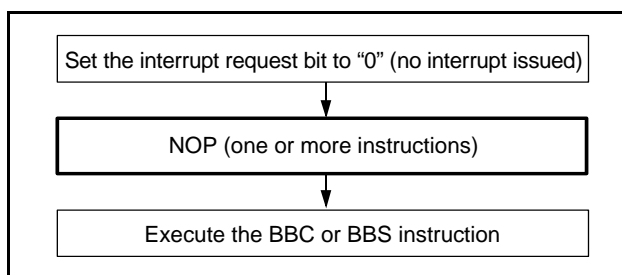

Fig 91. Sequence of check of interrupt request bit

## Notes on Timers

### 1. Division Ratio of Timers 1, 2, and A

When n (0 to 255) is written to a timer latch, the frequency division ratio is  $1/(n+1)$ .

### 2. Switching Count Source of Timers 1, 2, and A

When a count source of timer 1, timer 2 or timer A is switched, stop a count of the timer.

### 3. Reading from and Writing to Timers 1, 2, and Prescaler 12

If the timer/prescaler count source clock and  $\phi$ SOURCE are different clocks, the timers and prescaler cannot be read or written. Select the same clock to enable read and write operations.

Note that timer 2 can be read and written even using a different clock while its counting is stopped.

① Prescaler 12 and timer 1 cannot be read/written in the following conditions:

Prescaler 12 count source: XCIN input clock

$\phi$ SOURCE: Clock other than XCIN input clock

② Timer 2 cannot be read/written during counting in the following conditions:

Timer 2 count source: Prescaler 12

Prescaler 12 count source: XCIN input clock

$\phi$ SOURCE: Clock other than XCIN input clock

or

Timer 2 count source: Timer A underflow

Timer A count source: XCIN input clock

$\phi$ SOURCE: Clock other than XCIN input clock

or

Timer 2 count source: Timer A underflow

Timer A count source: low-speed on-chip oscillator output

$\phi$ SOURCE: Clock other than low-speed on-chip oscillator

### 4. Count Source of Prescaler 12

The XCIN input clock can be selected as the prescaler count source only if the 32 kHz quartz crystal oscillator is selected by the oscillation method selection bit in FSR0M1.

### 5. Timer Value Setting

When the timer A write control bit is set to "write to only latch", written data is written to only to the latch even when the timer is stopped. To set the initial setting value when the timer is stopped, select "Write to timer and latch simultaneously" beforehand.

## 6. Reading from and Writing to Timer A

If the timer A count source clock and  $\phi$ SOURCE are different clocks, timer A cannot be read or written during its counting. Select the same clock or set timer A to stop counting to enable read and write operations.

- Timer A cannot be read/written in the following conditions:  
 Timer A count source: XCIN input clock  
 $\phi$ SOURCE: Clock other than XCIN input clock  
 or  
 Timer A count source: Low-speed on-chip oscillator output  
 $\phi$ SOURCE: Clock other than low-speed on-chip oscillator

## 7. Count Source of Timer A

The XCIN input clock can be selected as the count source of timer A only if the 32 kHz quartz crystal oscillator is selected by the oscillation method selection bit in FSR0M1.

### Notes on Output Compare

- (1) If timer A is stopped, when a value is written to the capture/compare register it is immediately transferred to the compare latch. In addition, if timer A is stopped and the compare x trigger enable bit is set to "1", the output latch is initialized.
- (2) Do not write the same data to both of compare latch x0 and x1.
- (3) When setting value of the compare latch is larger than timer setting value, compare match signal is not generated. Accordingly, the output waveform is fixed to "L" or "H" level.  
 However, when setting value of another compare latch is smaller than timer setting value, this compare match signal is generated. Accordingly, compare interrupt occurs.
- (4) When the compare x trigger enable bit is cleared to "0" (disabled), the match trigger to the waveform output circuit is disabled, and the output waveform can be fixed to "L" or "H" level.  
 However, in this case, the compare match signal is generated.  
 Accordingly, compare interrupt occurs.

### Notes on Input Capture

- (1) When the low-speed on-chip oscillator output or XCIN input clock is selected as the count source of timer A, input capture can be used only if the same clock source is selected as  $\phi$ SOURCE and as the count source of timer A.
- (2) When writing "1" to capture y software trigger bit of capture latch 00 and 01 at the same time, or external trigger and software trigger occur simultaneously, if capture latches 00 and 01 are input simultaneously, the set value of capture 0 status bit is undefined.
- (3) When setting the interrupt active edge selection bit and noise filter clock selection bit of capture 0 the interrupt request bit may be set to "1".  
 When not requiring the interrupt occurrence synchronized with these setting, take the following sequence.  
 ①Set the capture interrupt enable bit to "0" (disabled).  
 ②Set the interrupt edge selection bit or noise filter clock selection bit.  
 ③Set the corresponding interrupt request bit to "0" after 1 or more instructions have been executed.  
 ④Set the capture interrupt enable bit to "1" (enabled).
- (4) When the capture interrupt is used as the interrupt for return from stop mode, set the capture 0 noise filter clock selection bits to "00 (Filter stop)".

## Notes on Serial I/O

### 1. Serial I/O interrupt

When setting the transmit enable bit to “1”, the serial I/O transmit interrupt request bit is automatically set to “1”. When not requiring the interrupt occurrence synchronized with the transmission enabled, take the following sequence.

1. Set the serial I/O transmit interrupt enable bit to “0” (disabled).
2. Set the transmit enable bit to “1”.
3. Set the serial I/O transmit interrupt request bit to “0” after 1 or more instructions have been executed.
4. Set the serial I/O transmit interrupt enable bit to “1” (enabled).

### 2. I/O pin function when serial I/O is enabled.

The functions of P06 and P07 are switched with the setting values of a serial I/O mode selection bit and a serial I/O synchronous clock selection bit as follows.

- (1) Serial I/O mode selection bit → “1” :  
Clock synchronous type serial I/O is selected.
  - Setup of a serial I/O synchronous clock selection bit  
“0” : P06 pin turns into an output pin of a synchronous clock.
  - “1” : P06 pin turns into an input pin of a synchronous clock.  
Setup of a  $\overline{\text{SRDY}}$  output enable bit (SRDY)  
“0” : P07 pin can be used as a normal I/O pin.  
“1” : P07 pin turns into a  $\overline{\text{SRDY}}$  output pin.
- (2) Serial I/O mode selection bit → “0” :  
Clock asynchronous (UART) type serial I/O is selected.
  - Setup of a serial I/O synchronous clock selection bit  
“0” : P06 pin can be used as a normal I/O pin.  
“1” : P06 pin turns into an input pin of an external clock.
  - When clock asynchronous (UART) type serial I/O is selected, it is P07 pin. It can be used as a normal I/O pin.

## Notes on A/D conversion

### 1. Analog input pin

Make the signal source impedance for analog input low, or equip an analog input pin with an external capacitor of 0.01μF to 1μF. Further, be sure to verify the operation of application products on the user side.

<Reason>

An analog input pin includes the capacitor for analog voltage comparison.

Accordingly, when signals from signal source with high impedance are input to an analog input pin, charge and discharge noise generates. This may cause the A/D conversion/comparison precision to be worse.

### 2. Clock frequency during A/D conversion

The comparator consists of a capacity coupling, and a charge of the capacity will be lost if the clock frequency is too low. This may cause the A/D conversion precision to be worse. Accordingly, set f(XIN) in order that the A/D conversion clock is 250 kHz or over during A/D conversion.

### 3. Read A/D conversion register

- 8-bit read

Read only the A/D conversion low-order register (address 3516).

- 10-bit read

Read the A/D conversion high-order register (address 3616) first, and then, read the A/D conversion low-order register (address 3516).

In this case, the high-order 6 bits of address 3616 returns “0” when read.

### 4. A/D translation accuracy

As for A/D translation accuracy, on the following operating conditions, accuracy may become low.

- (1) When VCC voltage is lower than [3.0 V], the accuracy at the low temperature may become extremely low compared with that at room temperature. When the system would be used at low temperature, the use at VCC = 3.0 V or more is recommended.
- (2) When XCIN or the low-speed on-chip oscillator is selected as  $\phi\text{SOURCE}$ , the A/D converter cannot be used.

## Notes on Watchdog Timer

### 1. Watchdog Timer Underflow

The watchdog timer operates in wait mode. To prevent underflow, write to the watchdog timer control register.

The watchdog timer stops in stop mode, but starts counting at the same time as exiting stop mode. After exiting stop mode, it continues counting during oscillation stabilization time. To prevent underflow during the period, the watchdog timer H count source selection bit (bit 7) in the watchdog timer control register (address 003916) should be set to "0" before executing the STP instruction.

Note that the watchdog timer continues counting even if the STP instruction is executed in the following two conditions:

- ① Stopping the low-speed on-chip oscillator: Disabled (bit 4 in FSROM2)  
Source clock of the watchdog timer: Low-speed on-chip oscillator/16 (bit 0 in FSROM2)
- ② Stopping the low-speed on-chip oscillator: Disabled (bit 4 in FSROM2)  
Source clock of the watchdog timer:  $\phi$ SOURCE (bit 0 in FSROM2)  
 $\phi$ SOURCE: Low-speed on-chip oscillator (bits 5 and 4 in CLKM)

### 2. STP instruction function selection bit

The function of the STP instruction can be selected by the bit 2 in FSROM2. This bit cannot be used for rewriting by executing the STP instruction.

- When this bit is set to "0", stop mode is entered by executing the STP instruction.
- When this bit is set to "1", internal reset occurs by executing the STP instruction.

## Notes on RESET pin

### 1. Connecting capacitor

In case where the  $\overline{\text{RESET}}$  signal rise time is long, connect a ceramic capacitor or others across the  $\overline{\text{RESET}}$  pin and Vss pin. And use a 1000 pF or more capacitor for high frequency use. When connecting the capacitor, note the following:

- Make the length of the wiring which is connected to a capacitor as short as possible.
- Be sure to verify the operation of application products on the user side.

<Reason>

If the several nanosecond or several ten nanosecond impulse noise enters the  $\overline{\text{RESET}}$  pin, it may cause a microcomputer failure.

## Note on Clock Generating Circuit

### 1. Switching to XIN/XCIN Oscillator

After a reset is cleared, operation starts using the low-speed on-chip oscillator. When switching to XIN/XCIN oscillator, make sure to set a sufficient wait duration with the on-chip oscillator to allow the XIN/XCIN oscillator to stabilize.

## Note on Oscillation Control

For use with the oscillation stabilization set bit after release of the STP instruction set to "1", set values in timer 1 and prescaler 12 after fully appreciating the oscillation stabilization time of the oscillator to be used.

## Notes on Oscillation Stop Detection Circuit

- (1) Do not execute the transition to "state 2'a" shown in Figure 68 State transition of oscillation stop detection circuit. In this state, no reset is triggered and the MCU is stopped even when the XIN oscillation stops.
- (2) After an oscillation stop detection reset, if this reset is enabled while bits XIN oscillation stop detection function active and oscillation stop detection status are retained, a reset is triggered again.
- (3) The oscillation stop detection status bit is initialized under the following conditions:
  - External reset, power-on reset, low-voltage detection reset, watchdog timer reset, and reset by the STP instruction function.
  - Write 0 to the XIN oscillation stop detection function active bit
- (4) While the oscillation stop detection function is in active, the oscillation stop detection status bit may set to 1 when the watchdog timer underflows or by a reset when the STP instruction is executed with the STP instruction function selection bit set to 1.  
When an oscillation stop detection reset is triggered, reconfirm that oscillation is stopped.
- (5) The oscillation stop detection circuit is not included in the emulator MCU "M37549RLSS".

## Note on Power Source Voltage

When the power source voltage value of a microcomputer is less than the value which is indicated as the recommended operating conditions, the microcomputer does not operate normally and may perform unstable operation.

In a system where the power source voltage drops slowly when the power source voltage drops or the power supply is turned off, reset a microcomputer when the supply voltage is less than the recommended operating conditions and design a system not to cause errors to the system by this unstable operation.

## Note on Handling of Power Source Pin

In order to avoid a latch-up occurrence, connect a capacitor suitable for high frequencies as bypass capacitor between power source pin (VCC pin) and GND pin (VSS pin). A ceramic capacitor of 0.01  $\mu$ F to 0.1  $\mu$ F is recommended.

Connect a capacitor across the power source pin and GND pin with the shortest possible wiring.

**Note on Memory**

- (1) Because the contents of RAM are indefinite at reset, set initial values before using.
- (2) Do not access to the reserved area.
- (3) Random data is written into the Renesas shipment test area and the reserved ROM area. Do not rewrite the data in these areas. Data of these area may be changed without notice. Accordingly, do not include these areas into programs such as checksum of all ROM areas.
- (4) The QzROM values in function set ROM data 0 to 2 set the operating modes of the various peripheral functions after an MCU reset is released. Do not fail to set the value for the selected function. Bits designated with a fixed value of 1 or 0 must be set to the designated value.

**Notes on QzROM****1. Note on Product shipped in blank**

As for the product shipped in blank, Renesas does not perform the writing test to user ROM area after the assembly process though the QzROM writing test is performed enough before the assembly process. Therefore, a writing error of approx.0.1 % may occur.

Moreover, please note the contact of cables and foreign bodies on a socket, etc. because a writing environment may cause some writing errors.

**2. QzROM Writing Orders**

When ordering the QzROM product shipped after writing, submit the mask file (extension: .mask) which is made by the mask file converter MM.

Be sure to set the ROM option ("MASK option" written in the mask file converter) setup when making the mask file by using the mask file converter MM.

**3. ROM Code Protect  
(QzROM product shipped after writing)**

As for the QzROM product shipped after writing, the ROM code protect is specified according to the ROM option setup data in the mask file which is submitted at ordering.

Renesas Technology corp. write the value of the ROM option setup data in the ROM code protect address (address FFDB16) when writing to the QzROM. As a result, in the contents of the ROM code protect address the ordered value may differ from the actual written value.

The ROM option setup data in the mask file is "0016" for protect enabled or "FF16" for protect disabled. Therefore, the contents of the ROM code protect address (other than the user ROM area) of the QzROM product shipped after writing is "0016" or "FF16".

Note that the mask file which has nothing at the ROM option data or has the data other than "0016" and "FF16" can not be accepted.

**4. Data Required for QzROM Writing Orders**

The following are necessary when ordering a QzROM product shipped after writing:

1. QzROM Writing Confirmation Form\*
2. Mark Specification Form\*
3. ROM data.....Mask file

\* For the QzROM writing confirmation form and the mark specification form, refer to the "Renesas Technology Corp." Homepage (<http://www.renesas.com/homepage.jsp>).

Note that we cannot deal with special font marking (customer's trademark etc.) in QzROM microcomputer.

REVISION HISTORY	7548 Group Datasheet
------------------	----------------------

Rev.	Date	Description	
		Page	Summary
1.00	Dec 28, 2006	-	First edition issued
1.01	Dec 28, 2006	1	Key-on wakeup is changed.
		14	Fig.12 is revised.
		19	Fig.16 is revised.
2.00	Mar 15, 2007	1	FEATURES: “• LED output port” → “• LED direct drive port” “• Built-in high-speed on-chip oscillator” → “High-speed on-chip oscillator” “• Built-in low-speed on-chip oscillator” → “Low-speed on-chip oscillator” • Power dissipation; “TBD” → “30 mW”
		4	Table 1: I/O port P00-P07; “LED direct drive ports” is added A/D converter; “8 channel” → “× 8 channel”
		6	Table 2: P03 “Capture function pin” → “Capture input pin” P10-P12 “Compare function pin” → “Compare output pin” P13 “Timer 2 function pin” → “Timer 2 output pin” P20, P21 “external oscillator pin” → “clock pins”
		10	[CPU mode register]: Description is revised and moved from the page 12.
		11	Function set ROM Area: Description is revised and moved from the page 47. <Notes>: (2) is added, (3) is revised
		12	Fig 8 Note is deleted
		14	Fig 10, Fig 11, Fig 12 is moved from the page 47. Fig 12 is revised
		15	[Pull-up control registers]: Description revised Fig 13, Fig 14, Fig 15 is revised
		16	Table 6 is revised
		17, 18	Fig 17, Fig 18; Title is revised
		19	Contents of Table 7 is added
		21	Table 8: Key-on wakeup “P0” → “P1”
		24	Timers, • Notes on Timers 1 and 2: Description is revised
		26	Timer A (TA), • Notes on Timer A: Description is revised
		27	Output compare: Contents of description added Fig 30 “oscillator/512” → “oscillator/16”
		31	Input capture: Contents of description added
		32	Fig 40 “oscillator/512” → “oscillator/16”
		37, 38	register name: “A/D” → “AD”
		38	• Notes on A/D converter: (2) is added
		39	Watchdog Timer is revised Fig 51, Fig 54 is revised
		40	• Notes on Watchdog Timer is revised
		42	Fig 57 is revised
		43	Clock Circuit is revised
		44	Oscillation Control is added Table 9 is added Fig 62 is revised
		47	Fig 63 is revised
		48	Fig 64 is revised

REVISION HISTORY	7548 Group Datasheet
------------------	----------------------

Rev.	Date	Description	
		Page	Summary
2.00	Mar 15, 2007	49	“oscillation stop” → “oscillation stop detection” Fig 65 is revised Fig 66 is revised, Note 4 is added • Notes on Function Set ROM Data 2 is deleted
		50	Table 10: P10 “ESDA input” → “ESDA I/O”, “Output” → “I/O”
		53	(7) CPU Mode Register is revised
		58	Overvoltage: Description revised, Fig 80 is added
		59	ELECTRICAL CHARACTERISTICS is added
2.01	Oct 15, 2007	1	Interrupts. “13 sources, 13 vectors”→“12 sources, 12 vectors”
		4	Interrupts. “13 sources, 13 vectors”→“12 sources, 12 vectors” Power dissipation “TBD”→“30 mW”
		10	“Stack page bit”→“Stack page selection bit”
		14	Fig 12 is revised.
		17	Fig 17 (6) and (8) are revised.
		19	Table 7 RESET is added.
		20-24	Interrupts is revised. Fig 21-23 are added.
		26	Fig 25 is revised.
		30	Fig 33 is revised.
		42	Fig 54 is revised.
		43	Fig 56 is revised.
		52	Oscillation stop detection circuit is revised.
		54	Vcc, Vss “Apply 1.8 to 5.5 V to Vcc”→“Apply 2.7 to 5.5 V to Vcc”
		57	(7) CPU Mode Register is revised.
		59	3. Writing to analog input pins is revised.
		65	Table 14 “RHSOSC”→“RHSOSO” Min.: “TBD”→“3.8”, “3.6”, Max.: “TBD”→“4.2”, “4.4” “RLSOSC”→“RLSOSO”
		67	Table 16 Absolute accuracy Max.: “TBD”→“3” Table 17 A/D conversion clock frequency Min.: “TBD”→“0.016”
		74	APPENDIX is added.
		All pages	“PRELIMINARY” deleted.

**Notes:**

1. This document is provided for reference purposes only so that Renesas customers may select the appropriate Renesas products for their use. Renesas neither makes warranties or representations with respect to the accuracy or completeness of the information contained in this document nor grants any license to any intellectual property rights or any other rights of Renesas or any third party with respect to the information in this document.
2. Renesas shall have no liability for damages or infringement of any intellectual property or other rights arising out of the use of any information in this document, including, but not limited to, product data, diagrams, charts, programs, algorithms, and application circuit examples.
3. You should not use the products or the technology described in this document for the purpose of military applications such as the development of weapons of mass destruction or for the purpose of any other military use. When exporting the products or technology described herein, you should follow the applicable export control laws and regulations, and procedures required by such laws and regulations.
4. All information included in this document such as product data, diagrams, charts, programs, algorithms, and application circuit examples, is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas products listed in this document, please confirm the latest product information with a Renesas sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas such as that disclosed through our website. (<http://www.renesas.com>)
5. Renesas has used reasonable care in compiling the information included in this document, but Renesas assumes no liability whatsoever for any damages incurred as a result of errors or omissions in the information included in this document.
6. When using or otherwise relying on the information in this document, you should evaluate the information in light of the total system before deciding about the applicability of such information to the intended application. Renesas makes no representations, warranties or guarantees regarding the suitability of its products for any particular application and specifically disclaims any liability arising out of the application and use of the information in this document or Renesas products.
7. With the exception of products specified by Renesas as suitable for automobile applications, Renesas products are not designed, manufactured or tested for applications or otherwise in systems the failure or malfunction of which may cause a direct threat to human life or create a risk of human injury or which require especially high quality and reliability such as safety systems, or equipment or systems for transportation and traffic, healthcare, combustion control, aerospace and aeronautics, nuclear power, or undersea communication transmission. If you are considering the use of our products for such purposes, please contact a Renesas sales office beforehand. Renesas shall have no liability for damages arising out of the uses set forth above.
8. Notwithstanding the preceding paragraph, you should not use Renesas products for the purposes listed below:
  - (1) artificial life support devices or systems
  - (2) surgical implantations
  - (3) healthcare intervention (e.g., excision, administration of medication, etc.)
  - (4) any other purposes that pose a direct threat to human lifeRenesas shall have no liability for damages arising out of the uses set forth in the above and purchasers who elect to use Renesas products in any of the foregoing applications shall indemnify and hold harmless Renesas Technology Corp., its affiliated companies and their officers, directors, and employees against any and all damages arising out of such applications.
9. You should use the products described herein within the range specified by Renesas, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
12. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written approval from Renesas.
13. Please contact a Renesas sales office if you have any questions regarding the information contained in this document, Renesas semiconductor products, or if you have any other inquiries.
