ICS85222-02 1-TO-2 LVCMOS / LVTTTL-TO- DIFFERENTIAL HSTL TRANSLATOR

GENERAL DESCRIPTION

The ICS85222-02 is a 1-to-2 LVCMOS / LVTTTL-to-Differential HSTL translator and a member of the HiPerClocks™ family of High Performance Clock Solutions from ICS. The ICS85222-02 has one single ended clock input. The single ended clock input accepts LVCMOS or LVTTTL input levels and translates them to HSTL levels. The small outline 8-pin SOIC package makes this device ideal for applications where space, high performance and low power are important.

FEATURES

- Two differential HSTL outputs
- One LVCMOS/LVTTTL clock input
- CLK input can accept the following input levels: LVCMOS or LVTTTL
- Maximum output frequency: 350MHz
- Part-to-part skew: TBD
- Propagation delay: 1ns (typical)
- V_{OH} : 1.4V (maximum)
- Full 3.3V operating supply voltage
- 0°C to 70°C ambient operating temperature
- Industrial temperature information available upon request
- Available in both standard and lead-free RoHS compliant packages

HSTL OUTPUT

All unused HSTL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS85222-02. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS85222-02 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 5\% = 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{DD_MAX} * I_{DD_MAX} = 3.465V * 90mA = 311.85mW$
- Power (outputs)_{MAX} = **73.8mW/Loaded Output pair**
If all outputs are loaded, the total power is $2 * 73.8mW = 147.6mW$

Total Power_{MAX} (3.465V, with all outputs switching) = $121.3mW + 147.6mW = 459.5mW$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total device power dissipation (example calculation is in Section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 103.3°C/W per Table 5 below. Therefore, T_j for an ambient temperature of 70°C with all outputs switching is:

$$70^\circ C + 0.460W * 103.3^\circ C/W = 117.5^\circ C. \text{ This is below the limit of } 125^\circ C.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

TABLE 5. THERMAL RESISTANCE θ_{JA} FOR 8-PIN SOIC, FORCED CONVECTION

	θ_{JA} by Velocity (Linear Feet per Minute)		
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	153.3°C/W	128.5°C/W	115.5°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	112.7°C/W	103.3°C/W	97.1°C/W

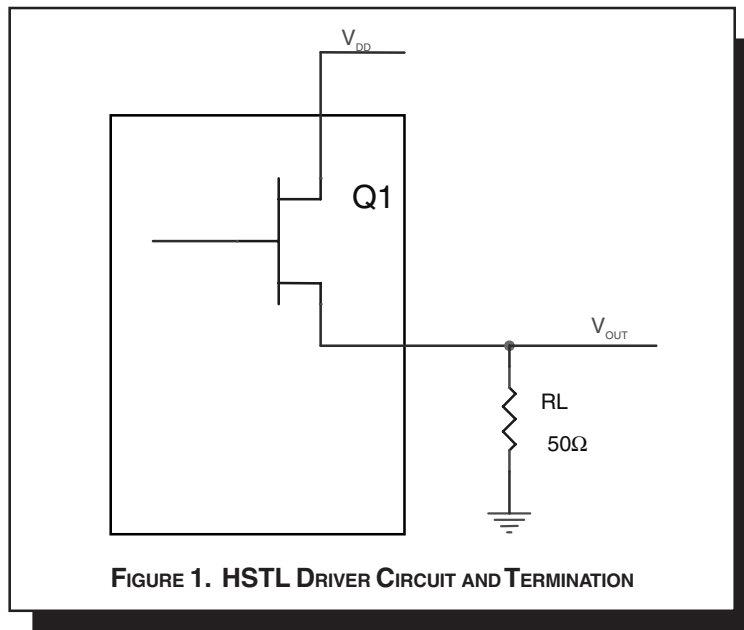

NOTE: Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

HSTL output driver circuit and termination are shown in *Figure 1*.

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load.

Pd_H is power dissipation when the output drives high.

Pd_L is the power dissipation when the output drives low.

$$Pd_H = (V_{OH_MIN} / R_L) * (V_{DD_MAX} - V_{OH_MIN})$$

$$Pd_L = (V_{OL_MAX} / R_L) * (V_{DD_MAX} - V_{OL_MAX})$$

$$Pd_H = (1V/50\Omega) * (3.465V - 1V) = \mathbf{49.3mW}$$

$$Pd_L = (0.4V/50\Omega) * (3.465V - 0.4V) = \mathbf{24.52mW}$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = \mathbf{73.8mW}$$
