FEMTOCLOCKS<sup>TM</sup> CRYSTAL-TO-3.3V, 2.5V LVPECL CLOCK GENERATOR

#### GENERAL DESCRIPTION

The ICS843023I is a Gigabit Ethernet Clock Generator and a member of the HiPerClocks™ family of high performance devices from ICS. The ICS843023I uses a 25MHz crystal to synthesize 250MHz. The ICS8430231 has

excellent phase jitter performance, over the 1.875MHz - 20MHz integration range. The ICS843023I is packaged in a small 8-pin TSSOP, making it ideal for use in systems with limited board space.

#### **F**EATURES

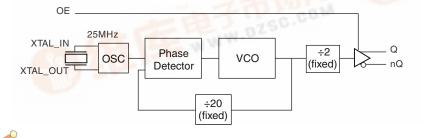

- 1 differential 3.3V LVPECL output
- Crystal oscillator interface designed for 25MHz, 18pF parallel resonant crystal
- Output frequency range: 245MHz 320MHz
- VCO range: 490MHz 640MHz
- RMS phase jitter @ 250MHz, using a 25MHz crystal (1.875MHz - 20MHz): 0.39ps (typical)

#### Phase noise:

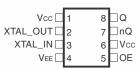

Phase noise:		
Offset	Noise Power	
100Hz	86.3 dBc/Hz	
1kHz	114.6 dBc/Hz	
10kHz	<mark>-125.6</mark> dBc/Hz	
100kHz	126 dBc/Hz	

- 3.3V or 2.5V operating supply
- -40°C to 85°C ambient operating temperature
- · Lead-Free package fully RoHS compliant

# APPLICATION INFORMATION

#### CRYSTAL INPUT INTERFACE

The ICS843023I has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 1* below were determined using a 25MHz, 18pF parallel

resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

#### TERMINATION FOR 3.3V LVPECL OUTPUT

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to

drive  $50\Omega$  transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 2A and 2B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

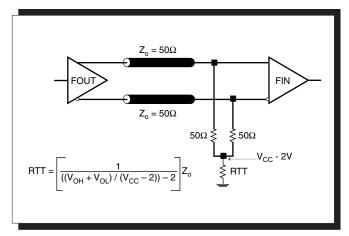

FIGURE 2A. LVPECL OUTPUT TERMINATION

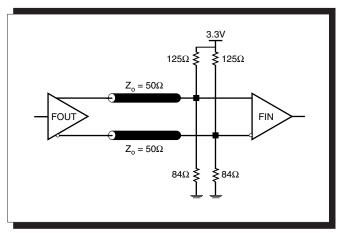

FIGURE 2B. LVPECL OUTPUT TERMINATION

#### **TERMINATION FOR 2.5V LVPECL OUTPUT**

Figure 3A and Figure 3B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50  $\Omega$  to V  $_{\rm CC}$  - 2V. For V  $_{\rm CC}$  = 2.5V, the V  $_{\rm CC}$  - 2V is very close to

ground level. The R3 in Figure 3B can be eliminated and the termination is shown in Figure 3C.

#### POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS843023I. Equations and example calculations are also provided.

#### 1. Power Dissipation.

The total power dissipation for the ICS843023I is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> = V<sub>CC MAX</sub> \* I<sub>EE MAX</sub> = 3.465V \* 75mA= 259.87mW
- Power (outputs)<sub>MAX</sub> = 30mW/Loaded Output pair

Total Power\_ $_{MAX}$  (3.465V, with all outputs switching) = 259.87mW + 30mW = 289.87mW

#### 2. Junction Temperature.

Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS $^{TM}$  devices is 125 $^{\circ}$ C.

The equation for Tj is as follows: Tj =  $\theta_{JA}$  \* Pd\_total + T<sub>A</sub>

Tj = Junction Temperature

 $\theta_{14}$  = Junction-to-Ambient Thermal Resistance

Pd\_total = Total Device Power Dissipation (example calculation is in section 1 above)

 $T_{\Delta}$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 1 meter per second and a multi-layer board, the appropriate value is 90.5°C/W per Table 6 below.

Therefore, Tj for an ambient temperature of 85°C with all outputs switching is:

 $85^{\circ}\text{C} + 0.290\text{W} * 90.5^{\circ}\text{C/W} = 111.2^{\circ}\text{C}$ . This is well below the limit of  $125^{\circ}\text{C}$ .

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

Table 6. Thermal Resistance  $\theta_{\text{JA}}$  for 8-pin TSSOP, Forced Convection

#### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in Figure 4.

To calculate worst case power dissipation into the load, use the following equations which assume a  $50\Omega$  load, and a termination voltage of  $V_{CC}$  - 2V.

• For logic high, 
$$V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.9V$$

$$(V_{CCO\_MAX} - V_{OH\_MAX}) = 0.9V$$

• For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.7V$ 

$$(V_{CCO\ MAX} - V_{OL\ MAX}) = 1.7V$$

Pd\_H is power dissipation when the output drives high. Pd\_L is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_{L}] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX}))/R_{L}] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.9V)/50\Omega] * 0.9V = 19.8mW$$

$$Pd_{L} = [(V_{\text{OL\_MAX}} - (V_{\text{CC\_MAX}} - 2V))/R_{L}] * (V_{\text{CC\_MAX}} - V_{\text{OL\_MAX}}) = [(2V - (V_{\text{CC\_MAX}} - V_{\text{OL\_MAX}}))/R_{L}] * (V_{\text{CC\_MAX}} - V_{\text{OL\_MAX}}) = [(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$$

Total Power Dissipation per output pair = Pd\_H + Pd\_L = 30mW
