description

The AM26LV31 is a BiCMOS quadruple differential line driver with 3-state outputs. It is designed to be similar to TIA/EIA-422-B and ITU Recommendation V.11 drivers with reduced supply-voltage range.

The device is optimized for balanced-bus transmission at switching rates up to 32 MHz. The outputs have very high current capability for driving balanced lines such as twisted-pair transmission lines and provide a high impedance in the power-off condition. The enable function is common to all four drivers and offers the choice of active-high or active-low enable inputs. The AM26LV31 is designed using Texas Instruments (TI™) proprietary LinIMPACT-C60™ technology, facilitating ultra-low power consumption without sacrificing speed. This device offers optimum performance when used with the AM26LV32 quadruple line receivers.

The AM26LV31C is characterized for operation from 0°C to 70°C.

4. Pulse skew is defined as the $|t_{PLH} - t_{PHL}|$ of each channel of the same device.
5. Skew limit is the difference between any two outputs of the same device switching in the same direction.
6. Skew limit (device to device) is the maximum difference in propagation delay times between any two channels of any two devices.
