## description

These octal bus transceivers are designed for asynchronous two-way communication between data buses. The control function implementation minimizes external timing requirements.

The device allows data transmission from the A bus to the B bus or from the B bus to the A bus, depending upon the logic level at the direction control (DIR) input. The enable input ( $\bar{G}$ ) can be used to disabled the device so that the buses are affectively isolated.

The 54ACT11245 is characterized for operation over the full military temperature range of - 55°C to 125°C. The 74ACT11245 is characterized for operation from - 40°C to 85°C.

‡Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
