Functional Description

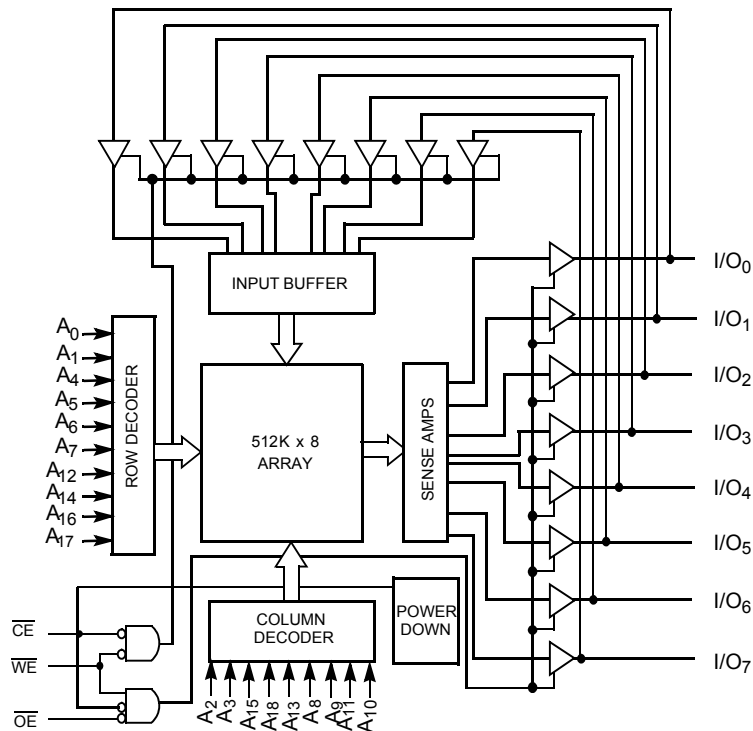

The CY62148BN is a high performance CMOS static RAM organized as 512K words by 8 bits. Easy memory expansion is provided by an active LOW Chip Enable (\overline{CE}), an active LOW Output Enable (\overline{OE}), and tri-state drivers. This device has an automatic power down feature that reduces power consumption by more than 99% when deselected.

To write to the device, take Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. Data on the eight I/O pins (I/O₀ through I/O₇) is then written into the location specified on the address pins (A₀ through A₁₇).

To read from the device, take Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) LOW while forcing Write Enable (\overline{WE}) HIGH for read. Under these conditions, the contents of the memory location specified by the address pins appear on the I/O pins.

The eight input/output pins (I/O₀ through I/O₇) go into a high-impedance state when the device is deselected (\overline{CE} HIGH), the outputs are disabled (\overline{OE} HIGH), or a write operation is in progress (\overline{CE} LOW and \overline{WE} LOW).

Notes

5. Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 100-pF load capacitance.
6. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
7. t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with a load capacitance of 5 pF as in part (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.
8. The internal write time of the memory is defined by the overlap of \overline{CE} LOW, and \overline{WE} LOW. \overline{CE} and \overline{WE} must be LOW to initiate a write, and the transition of any of these signals can terminate the write. The input data setup and hold timing should be referenced to the leading edge of the signal that terminates the write.

Read Cycle No. 1^[10, 11]

Read Cycle No. 2 (\overline{OE} Controlled)^[11, 12]

Notes

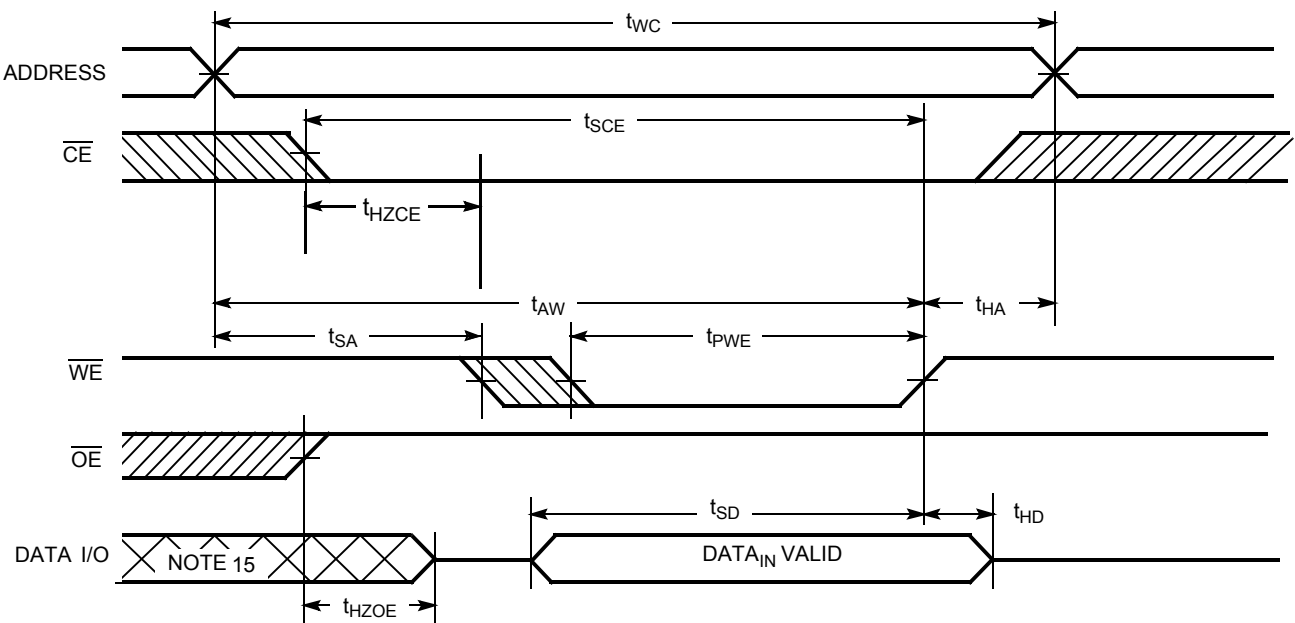

9. Full Device operation requires linear V_{CC} ramp from V_{DR} to $V_{CC(min)} \geq 100$ ms or stable at $V_{CC(min)} \geq 100$ ms.
10. Device is continuously selected. $\overline{OE}, CE = V_{IL}$.
11. WE is HIGH for read cycle.
12. Address valid prior to or coincident with \overline{CE} transition LOW.

Switching Waveforms (continued)

Write Cycle No. 1 ($\overline{\text{CE}}$ Controlled)^[13]

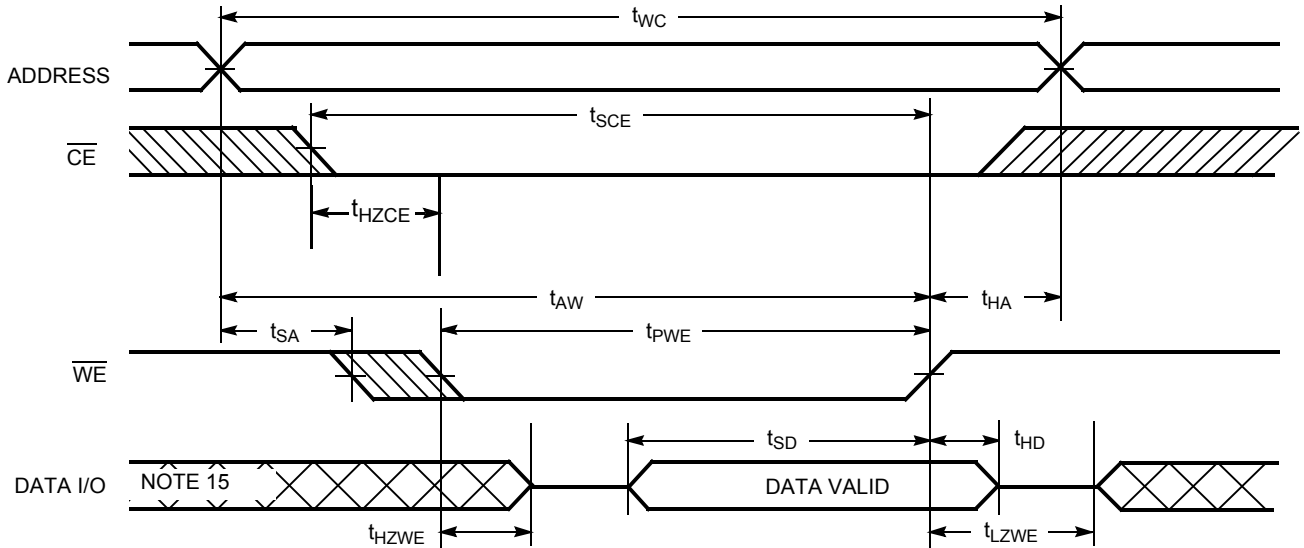

Write Cycle No. 2 ($\overline{\text{WE}}$ Controlled, $\overline{\text{OE}}$ HIGH During Write)^[13, 14]

Notes

- 13. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}}$ going HIGH, the output remains in a high impedance state.
- 14. Data I/O is high-impedance if $\overline{\text{OE}} = V_{IH}$.
- 15. During this period the I/Os are in the output state and input signals should not be applied.
