

FEATURES

Input sensitivity: 4 mV p-p
80 ps rise/fall times
CML outputs: 700 mV p-p differential
Programmable LOS detector: 3.5 mV to 35 mV
Rx signal strength indicator (RSSI)
SFF-8472-compliant average power measurement
Single-supply operation: 3.3 V
Low power dissipation: 145 mW
Available in space-saving 3 mm × 3 mm, 16-lead LFCSP
Extended temperature range: -40°C to +95°C
SFP reference design available

APPLICATIONS

SFP/SFF/GBIC optical transceivers
OC-3/OC-12/OC-48, GbE, Fibre Channel (FC) receivers
10GBASE-LX4 transceivers
WDM transponders

GENERAL DESCRIPTION

The ADN2891 is a 3.2 Gbps limiting amplifier with integrated loss-of-signal (LOS) detection circuitry and a received signal strength indicator (RSSI). This part is optimized for SONET, Gigabit Ethernet (GbE), and Fibre Channel optoelectronic conversion applications. The ADN2891 has a differential input sensitivity of 4 mV p-p and accepts up to a 2.0 V p-p differential input overload voltage. The ADN2891 supports current mode logic (CML) outputs with controlled rise and fall times.

By monitoring the bias current through a photodiode, the on-chip RSSI detector measures the average power received with 2% typical linearity over the entire valid input range of the photodiode. The on-chip RSSI detector facilitates SFF-8472-compliant optical transceivers by eliminating the need for external RSSI detector circuitry.

Additional features include a programmable loss-of-signal (LOS) detector and output squelch.

The ADN2891 is available in a 3 mm × 3 mm, 16-lead LFCSP.

ADN2891

Parameter	Min	Typ	Max	Unit	Test Conditions/Comments
LOGIC INPUTS (SQUELCH)					
V_{IH} , Input High Voltage	2.0			V	
V_{IL} , Input Low Voltage			0.8	V	
Input Current			40	μA	I_{INH} , $V_{IN} = 2.4$ V, 100 k Ω pull-down resistor on-chip
			6	μA	I_{INL} , $V_{IN} = 0.4$ V, 100 k Ω pull-down resistor on-chip
LOGIC OUTPUTS (LOS)					
V_{OH} , Output High Voltage	2.4			V	Open drain output, 4.7 k Ω to 10 k Ω pull-up resistor to VCC
V_{OL} , Output Low Voltage			0.4	V	Open drain output, 4.7 k Ω to 10 k Ω pull-up resistor to VCC

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Power Supply Voltage	4.2 V
Minimum Voltage (All Inputs and Outputs)	VEE – 0.4 V
Maximum Voltage (All Inputs and Outputs)	VCC + 0.4 V
Storage Temperature	–65°C to +150°C
Operating Temperature Range	–40°C to +95°C
Production Soldering Temperature	J-STD-20
Junction Temperature	125°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

θ_{JA} is specified for 4-layer PCB with exposed paddle soldered to GND.

Table 3.

Package Type	θ_{JA}	Unit
3 mm × 3 mm, 16-lead LFCSP	28	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

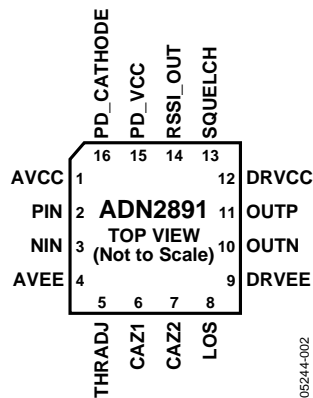

Figure 2. Pin Configuration

Note that the LFCSP has an exposed pad on the bottom. To improve heat dissipation, the exposed pad must be soldered to the GND plane with filled vias.

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	I/O Type ¹	Descriptions
1	AVCC	P	Analog Power Supply.
2	PIN	AI	Differential Data Input, Positive Port, 50 Ω On-Chip Termination.
3	NIN	AI	Differential Data Input, Negative Port, 50 Ω On-Chip Termination.
4	AVEE	P	Analog Ground.
5	THRADJ	AO	LOS Threshold Adjust Resistor.
6	CAZ1	AI	If needed, one capacitor can connect between the CAZ1 and CAZ2 pin for input offset correction.
7	CAZ2	AI	If needed, one capacitor can connect between the CAZ1 and CAZ2 pin for input offset correction.
8	LOS	DO	LOS Detector Output, Open Collector.
9	DRVVEE	P	Output Buffer Ground.
10	OUTN	DO	Differential Data Output, CML, Negative Port, 50 Ω On-Chip Termination.
11	OUTP	DO	Differential Data Output, CML, Positive Port, 50 Ω On-Chip Termination.
12	DRVCC	P	Output Buffer Power Supply.
13	SQUELCH	DI	Disable Outputs, 100 k Ω On-Chip Pull-Down Resistor.
14	RSSI_OUT	AO	Average Current Output.
15	PD_VCC	P	Power Input for RSSI Measurement.
16	PD_CATHODE	AO	Photodiode Bias Voltage.
Exposed Pad	Pad	P	Connect to Ground.

¹ P = power; DI = digital input; DO = digital output; AI = analog input; and AO = analog output.

THEORY OF OPERATION

LIMITING AMPLIFIER

Input Buffer

The ADN2891 limiting amplifier provides differential inputs (PIN/NIN), each having single-ended, on-chip, 50 Ω termination. The amplifier can accept either dc-coupled or ac-coupled signals; however, an ac-coupled signal is recommended. Using a dc-coupled signal, the amplifier needs a correct input common-mode voltage and enough headroom to handle the dynamic input signal strength. Additionally, TIA output offset drifts may degrade receiver performance.

The ADN2891 limiting amplifier is a high gain device. It is susceptible to dc offsets in the signal path. The pulse width distortion presented in the NRZ data or a distortion generated by the TIA may appear as dc offset or a corrupted signal to the ADN2891 inputs. An internal offset correction loop can compensate for certain levels of offset. To compensate for more offset, an external capacitor connected between the CAZ1 and CAZ2 pins maybe necessary. For GbE and FC applications, no external capacitor is necessary; however, for SONET applications, a 0.01 μ F capacitor helps the input signal offset compensation and provides a 3 dB cutoff frequency at 1 kHz.

CML Output Buffer

The ADN2891 provides differential CML outputs, OUTP and OUTN. Each output has an internal 50 Ω termination to VCC.

LOSS OF SIGNAL (LOS) DETECTOR

The on-chip LOS circuit drives LOS to logic high when the input signal level falls below a user-programmable threshold. The threshold level can be set to anywhere from 3.5 mV p-p to 35 mV p-p, typical, and is set by a resistor connected between the THRADJ pin and VEE. See Figure 8 and Figure 9 for the LOS threshold vs. THRADJ. The ADN2891 LOS circuit has an electrical hysteresis greater than 2.5 dB to prevent chatter at the LOS signal. The LOS output is an open-collector output that must be pulled up externally with a 4.7 k Ω to 10 k Ω resistor.

RECEIVED SIGNAL STRENGTH INDICATOR (RSSI)

The ADN2891 has an on-chip, RSSI circuit. By monitoring the current supplied to the photodiode, the RSSI circuit provides an accurate, average power measurement. The output of the RSSI is a current that is directly proportional to the average amount of PIN photodiode current. Placing a resistor between the RSSI_OUT pin and GND converts the current to a GND referenced voltage. This function eliminates the need for external RSSI circuitry for SFF-8472-compliant optical receivers. For more information, see Figure 14 to Figure 18.

SQUELCH MODE

Driving the SQUELCH input to logic high disables the limiting amplifier outputs. Using LOS output to drive the SQUELCH input, the limiting amplifier outputs stop toggling anytime a signal input level to the limiting amplifier drops below the programmed LOS threshold.

The SQUELCH pin has a 100 k Ω , internal, pull-down resistor.

PCB Layout

Figure 21 shows the recommended PCB layout. The 50 Ω transmission lines are the traces that bring the high frequency input and output signals (PIN, NIN, OUTP, and OUTN) to the SMA connectors with minimum reflection. To avoid a signal skew between the differential traces, each differential PIN/NIN and OUTP/OUTN pair should have matched trace lengths from the signal pins to the corresponding SMA connectors. C1, C2, C3, and C4 are ac coupling capacitors in series with the high speed, signal input/output paths. To minimize the possible mismatch, the ac coupling capacitor pads should be the same width as the 50 Ω transmission line trace width. To reduce supply noise, a 1 nF decoupling capacitor should be placed on the same layer as close as possible to the VCC pins. A 0.1 μ F decoupling capacitor can be placed on the bottom of the PCB directly underneath the 1 nF capacitor. All high speed, CML outputs have internal 50 Ω resistor termination between the output pin and VCC. The high speed inputs, PIN and NIN, also have the internal 50 Ω termination to an internal reference voltage.

As with any high speed, mixed-signal design, keep all high speed digital traces away from sensitive analog nodes.

Soldering Guidelines for the LFCSP

The lands on the 16-lead LFCSP are rectangular. The PCB pad for these should be 0.1 mm longer than the package land length and 0.05 mm wider than the package land width. The land should be centered on the pad. This ensures that the solder joint size is maximized. The bottom of the LFCSP has a central exposed pad. The pad on the printed circuit board should be at least as large as the exposed pad. Users must connect the exposed pad to VEE using filled vias so that solder does not leak through the vias during reflow. This ensures a solid connection from the exposed pad to VEE.
