14-Bit, Dual, Parallel Input, Multiplying
Digital-to-Analog Converter

FEATURES

- $\pm$**0.5LSB DNL**
- $\pm$**0.5LSB INL**
- **Low Noise: 12nV/$\sqrt{\text{Hz}}$**
- **Low Power: I_{DD} = 1μA per channel at 2.7V**
- **2mA Full-Scale Current, with V_{REF} = 10V**
- **Settling Time: 0.5μs**
- **14-Bit Monotonic**
- **4-Quadrant Multiplying Reference Inputs**
- **Reference Bandwidth: 10MHz**
- **Reference Input: $\pm$18V**
- **Reference Dynamics: –105 THD**
- **Midscale or Zero Scale Reset**
- **Analog Power Supply: +2.7V to +5.5V**
- **TSSOP-38 Package**
- **Industry-Standard Pin Configuration**
- **Pin Compatible with the 16-Bit DAC8822**
- **Temperature Range: –40°C to +125°C**

APPLICATIONS

- **Automatic Test Equipment**
- **Instrumentation**
- **Digitally Controlled Calibration**
- **Industrial Control PLCs**

DESCRIPTION

The DAC8805 dual, multiplying digital-to-analog converter (DAC) is designed to operate from a single 2.7V to 5.5V supply.

The applied external reference input voltage V_{REF} determines the full-scale output current. An internal feedback resistor (R_{FB}) provides temperature tracking for the full-scale output when combined with an external, current-to-voltage (I/V) precision amplifier.

A RSTSEL pin allows system reset assertion ($\overline{RS}$) to force all registers to zero code when RSTSEL = '0', or to mid-scale code when RSTSEL = '1'. Additionally, an internal power-on reset forces all registers to zero or mid-scale code at power-up, depending on the state of the RSTSEL pin.

A parallel interface offers high-speed communications. The DAC8805 is packaged in a space-saving TSSOP-38 package and has an industry-standard pinout. The device is specified from −40°C to +125°C.

For a 16-bit, pin-compatible version, see the DAC8822.
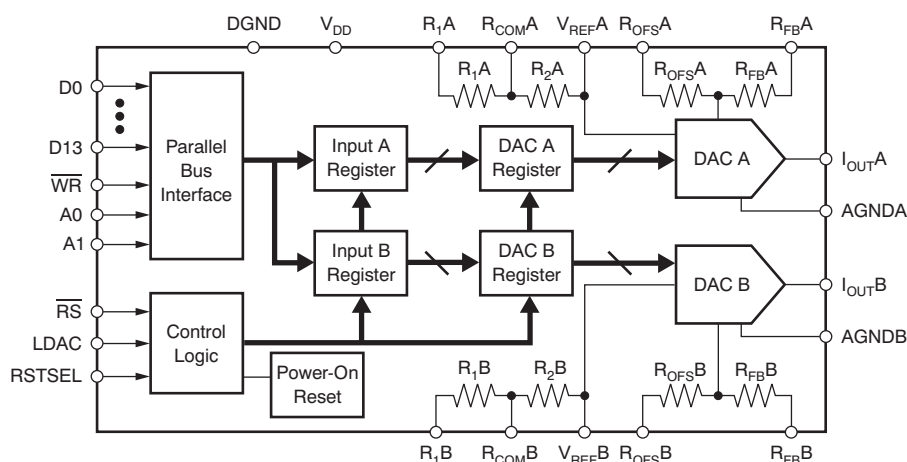

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION[1]

PRODUCT	RELATIVE ACCURACY (LSB)	DIFFERENTIAL NONLINEARITY (LSB)	PACKAGE-LEAD (DESIGNATOR)	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING
DAC8805Q	± 1	± 1	TSSOP-38 (DBT)	$-40°C$ to $+125°C$	DAC8805

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)[1]

	DAC8805	UNIT
V_{DD} to GND	-0.3 to $+7$	V
Digital input voltage to GND	-0.3 to $+V_{DD} + 0.3$	V
V (I_{OUT}) to GND	-0.3 to $+V_{DD} + 0.3$	V
REF, R_{OFS}, R_{FB}, R_1, R_{COM} to AGND, DGND	± 25	V
Operating temperature range	-40 to $+125$	°C
Storage temperature range	-65 to $+150$	°C
Junction temperature range (T_J max)	$+150$	°C
Power dissipation	$(T_J \text{ max} - T_A) / R_{\theta JA}$	W
Thermal impedance, $R_{\theta JA}$	53	°C/W
ESD rating	Human Body Model (HBM)	4000	V
	Charged Device Model (CDM)	500	V

(1) Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

All specifications at T_A = −40°C to +125°C, V_{DD} = +2.7V to +5.5V, I_{OUT} = virtual GND, GND = 0V, and V_{REF} = 10V, unless otherwise noted.

Table 1. TERMINAL FUNCTIONS

| PIN #	NAME	DESCRIPTION
1, 2	NC	No connection
3	$R_{OFS}A$	Bipolar Offset Resistor A. Accepts up to ±18V. In 2-quadrant mode, $R_{OFS}A$ ties to $R_{FB}A$. In 4-quadrant mode, $R_{OFS}A$ ties to R_1A and the external reference.
4	$R_{FB}A$	Internal Matching Feedback Resistor A. Connects to the external op amp for I-V conversion.
5	R_1A	4-Quadrant Resistor. In 2-quadrant mode, R_1A shorts to the $V_{REF}A$ pin. In 4-quadrant mode, R_1A ties to $R_{OFS}A$ and the reference input.
6	$R_{COM}A$	Center Tap Point of the Two 4-Quadrant Resistors, R_1A and R_2A. In 2-quadrant mode, $R_{COM}A$ shorts to the V_{REF} pin. In 4-quadrant mode, $R_{COM}A$ ties to the inverting node of the reference amplifier.
7	$V_{REF}A$	DAC A Reference Input in 2-Quadrant Mode, R_2 Terminal in 4-Quadrant Mode. In 2-quadrant mode, $V_{REF}A$ is the reference input with constant input resistance versus code. In 4-quadrant mode, $V_{REF}A$ is driven by the external reference amplifier.
8	$I_{OUT}A$	DAC A Current Output. Connects to the inverting terminal of external precision I-V op amp for voltage output.
9	AGNDA	DAC A Analog Ground.
10	DGND	Digital Ground.
11	AGNDB	DAC B Analog Ground.
12	$I_{OUT}B$	DAC B Current Output. Connects to the inverting terminal of external precision I-V op amp for voltage output.
13	$V_{REF}B$	DAC B Reference Input in 2-Quadrant Mode, R_2 Terminal in 4-Quadrant Mode. In 2-quadrant mode, $V_{REF}B$ is the reference input with constant input resistance versus code. In 4-quadrant mode, $V_{REF}B$ is driven by the external reference amplifier.
14	$R_{COM}B$	Center Tap Point of the Two 4-Quadrant Resistors, R_1B and R_2B. In 2-quadrant mode, $R_{COM}B$ shorts to the V_{REF} pin. In 4-quadrant mode, $R_{COM}B$ ties to the inverting node of the reference amplifier.
15	R_1B	4-Quadrant Resistor. In 2-quadrant mode, R_1B shorts to the $V_{REF}B$ pin. In 4-quadrant mode, R_1B ties to $R_{OFS}B$ and the reference input.
16	$R_{FB}B$	Internal Matching Feedback Resistor B. Connects to external op amp for I-V conversion.
17	$R_{OFS}B$	Bipolar Offset Resistor B. Accepts up to ±18V. In 2-quadrant mode, $R_{OFS}B$ ties to $R_{FB}B$. In 4-quadrant mode, $R_{OFS}B$ ties to R_1B and the external reference.
18	$\overline{WR}$	Write Control Digital Input In, Active Low. $\overline{WR}$ enables input registers. Signal level must be ≤ V_{DD} + 0.3V.
19	A0	Address 0. Signal level must be ≤ V_{DD} + 0.3V.
20	A1	Address 1. Signal level must be ≤ V_{DD} + 0.3V.
21	LDAC	Digital Input Load DAC Control. Signal level must be ≤ V_{DD} + 0.3V. See the Function of Control Inputs table for details.
22	RSTSEL	Power-On Reset State. RSTSEL = 0 corresponds to zero-scale reset. RSTSEL = 1 corresponds to mid-scale reset. The signal level must be ≤ V_{DD} + 0.3V.
23	$\overline{RS}$	Reset. Active low resets both input and DAC registers. Resets to zero-scale if RSTSEL= 0, and to mid-scale if RSTSEL = 1. Signal level must be equal to or less than VDD + 0.3 V.
24-28, 30-38	D0-D13	Digital Input Data Bits D0 to D13. Signal level must be ≤ V_{DD} +0.3V. D13 is MSB.
29	V_{DD}	Positive Power Supply Input. The specified range of operation is 2.7V to 5.5V.

THEORY OF OPERATION

The DAC8805 is a multiplying, dual-channel, current output, 14-bit DAC. The architecture, illustrated in Figure 40, is an R-2R ladder configuration with the three MSBs segmented. Each 2R leg of the ladder is either switched to GND or to the I_{OUT} terminal. The I_{OUT} terminal of the DAC is held at a virtual GND potential by the use of an external I/V converter op amp. The R-2R ladder is connected to an external reference input (V_{REF}) that determines the DAC full-scale output current. The R-2R ladder presents a code-independent load impedance to the external reference of 5kΩ ± 25%. The external reference voltage can vary in a range of −18V to +18V, thus providing bipolar I_{OUT} current operation. By using an external I/V converter op amp and the R_{FB} resistor in the DAC8805, an output voltage range of −V_{REF} to +V_{REF} can be generated.

Figure 40. Equivalent R-2R DAC Circuit

The DAC output voltage is determined by V_{REF} and the digital data (D) according to Equation 1:

$$V_{OUT}A/B = -V_{REF} \times \frac{D}{16384}$$

(1)

Each DAC code determines the 2R-leg switch position to either GND or I_{OUT}. The external I/V converter op amp noise gain will also change because the DAC output impedance (as seen looking into the I_{OUT} terminal) changes versus code. Because of this change in noise gain, the external I/V converter op amp must have a sufficiently low offset voltage such that the amplifier offset is not modulated by the DAC I_{OUT} terminal impedance change. External op amps with large offset voltages can produce INL errors in the transfer function of the DAC8805 because of offset modulation versus DAC code. For best linearity performance of the DAC8805, an op amp (such as the OPA277) is recommended, as shown in Figure 41. This circuit allows V_{REF} to swing from −10V to +10V.

Figure 41. Voltage Output Configuration

APPLICATION INFORMATION

DIGITAL INTERFACE

The parallel bus interface of the DAC8805 is comprised of a 14-bit data bus, D0—D13, address lines A0 and A1, and a $\overline{WR}$ control signal. Timing and control functionality are shown in Figure 1, and described in Table 2 and Table 3. The address lines must be set up and stable before the $\overline{WR}$ signal goes low, to prevent loading improper data to an undesired input register.

Both channels of the DAC8805 can be simultaneously updated by control of the LDAC signal, as shown in Figure 1. Reset control ($\overline{RS}$) and reset select control (RSTSEL) signals are provided to allow user reset ability to either zero scale or midscale codes of both the input and DAC registers.

STABILITY CIRCUIT

For a current-to-voltage (I/V) design, as shown in Figure 42, the DAC8805 current output (I_{OUT}) and the connection with the inverting node of the op amp should be as short as possible and laid out according to correct printed circuit board (PCB) layout design. For each code change, there is an output step function. If the gain bandwidth product (GBP) of the op amp is limited and parasitic capacitance is excessive at the inverting node, then gain peaking is possible. Therefore, a compensation capacitor C_1 (4pF to 20pF, typ) can be added to the design for circuit stability, as shown in Figure 42.

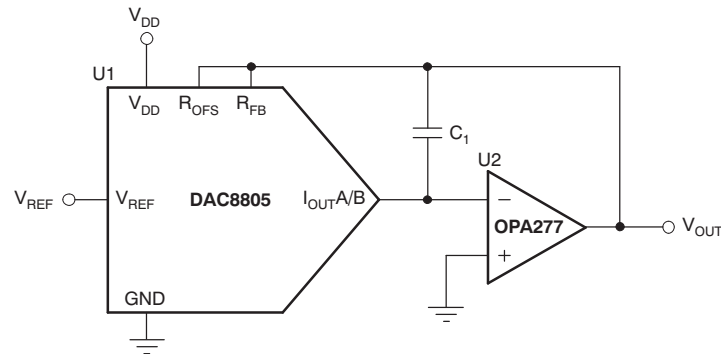

Figure 42. Gain Peaking Prevention Circuit with Compensation Capacitor

APPLICATION INFORMATION (continued)

BIPOLAR OUTPUT CIRCUIT

The DAC8805, as a 4-quadrant multiplying DAC, can be used to generate a bipolar output. The polarity of the full-scale output (I_{OUT}) is the inverse of the input reference voltage at V_{REF}.

Using a dual op amp, such as the OPA2277, full 4-quadrant operation can be achieved with minimal components. Figure 43 demonstrates a $\pm 10 V_{OUT}$ circuit with a fixed +10V reference. The output voltage is shown in Equation 2:

$$V_{OUT} = \left(\frac{D}{8192} - 1 \right) \times V_{REF}$$

(2)
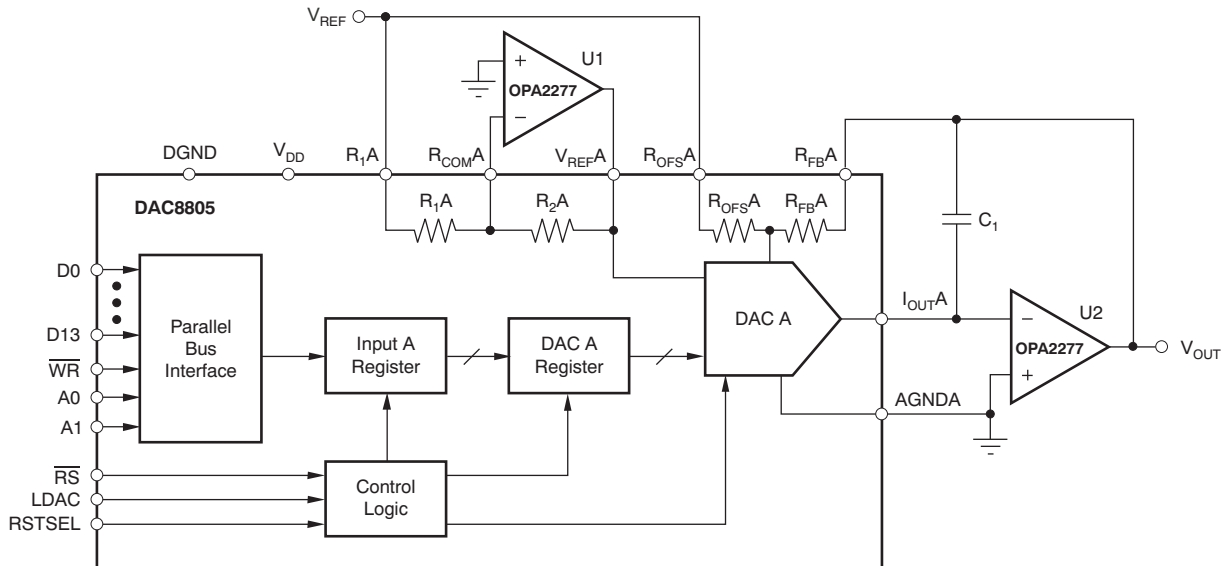

Figure 43. Bipolar Output Circuit

APPLICATION INFORMATION (continued)

PROGRAMMABLE CURRENT SOURCE CIRCUIT

The DAC8805 can be integrated into the circuit in Figure 44 to implement an improved Howland current pump for precise V/I conversions. Bidirectional current flow and high-voltage compliance are two features of the circuit. With a matched resistor network, the load current of the circuit is shown by Equation 3:

$$I_L A/B = \frac{(R_2 + R_3) / R_1}{R_3} \times V_{REF} \times \frac{D}{16384}$$

(3)

The value of R_3 in the previous equation can be reduced to increase the output current drive of U3. U3 can drive $\pm20mA$ in both directions with voltage compliance limited up to 15V by the U3 voltage supply. Elimination of the circuit compensation capacitor (C_1) in the circuit is not suggested as a result of the change in the output impedance (Z_O), according to Equation 4:

$$Z_O = \frac{R_1'R_3(R_1+R_2)}{R_1(R_2'+R_3') - R_1'(R_2+R_3)}$$

(4)

As shown in Equation 4, Z_O with matched resistors is infinite and the circuit is optimum for use as a current source. However, if unmatched resistors are used, Z_O is positive or negative with negative output impedance being a potential cause of oscillation. Therefore, by incorporating C_1 into the circuit, possible oscillation problems are eliminated. The value of C_1 can be determined for critical applications; for most applications, however, a value of several pF is suggested.

Figure 44. Programmable Bidirectional Current Source Circuit

CROSS-REFERENCE

The DAC8805 has an industry-standard pinout. Table 4 provides the cross-reference information.

Table 4. Cross-Reference

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PACKAGE MATERIALS INFORMATION

TAPE AND REEL INFORMATION

REEL DIMENSIONS
TAPE DIMENSIONS

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

NOTES: A.   All linear dimensions are in millimeters.
          B.   This drawing is subject to change without notice.
          C.   Publication IPC−7351 is recommended for alternate designs
          D.   Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should
               contact their board assembly site for stencil design recommendations. Refer to IPC−7525.
          E.   Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
